The bunches of grapes are cut from the vines by means of a pair of scissors. They are then put into large baskets, which the gatherers carry to one side of the vineyard, and there the grapes are tipped into tubs, placed ready for their reception. The tubs, when filled, are carried home in a cart or wagon, and the grapes are then, while in the tub, pounded or bruised, by a stout and pretty heavy piece of wood, which is made use of by the hand. From the tubs, the grapes are thrown into a very large vat, as soon as they are sufficiently bruised. In this vat the pulp of the bruised grapes and their juice, altogether, remain for as much as a week or ten days, covered over, as beer is when set to work, in order to undergo the *fermentation* that is necessary. While this fermentation is going on, the pulp and juice in the vat rise up, just as bread does that is made of yeast. After rising up and frothing for some time, the head sinks, as that of beer does; and then the fermentation is supposed to be nearly at an end. As soon as this sinking takes place, the juice that *flows* in the vat is drawn off, leaving the pulp, and the juice which still remains behind. The juice thus drawn off is considered to make the best wine in the vintage. When this juice is drawn off, all that which remains in the vat is taken out and pressed in the wine-press.—The juice runs away, from the press into a large tub sunk in the ground, from which it is emptied, directly into the *piece* or barrel. There is nothing at all mixed between the juice of the grape; and from the time that it is first put into the barrel, it remains there, until it is drawn off to bottle. The bung-hole of the barrel, after receiving the juice, must be left open, covered only by a vine leaf, for about ten days, in order that all fermentation may subside before the barrel be made close for good. This is the whole process of the vintage, as far as relates to the red wine. That of the white wine is somewhat different. The white grapes must be pressed directly after they have been bruised, and instead of fermenting in the vat, pulp & juice mixed also, either, like the red wine; the white wine must not be allowed to ferment till it has undergone all the pressing and separation of the pulp from the juice. It must be bruised, pressed and put to ferment in the barrel, without there being any lapse of time between these different stages

of the process. The reason for this, is, that if the white wine were to be allowed to ferment like the red, when its juice is mixed along with the pulp of the grapes and their stalks, the pulp and the stalks would spoil the color of the wine; and the wine would not, in fact, be *white wine* at all.

HOUSE-RENT IN FRANCE.

House-rent in France. At Alceon you may rent a comfortable house, consisting of six or seven good rooms, for 300 francs a year; that is to say, to 12*l.* sterling, or thereabouts; and let it be remarked, that this is a very fine and fashionable place.

LUCERNE.

I find some Lucerne hay for my horse in most parts of France. The French think the hay of Lucerne the best of any; and my horse seems, from the manner in which he deals with this sort of fodder, to be exactly the same opinion.

CULTURE OF THE POTATO ONION.

This variety, erroneously supposed to have been brought from Egypt by the British army about 1835, was grown in Driver's nursery in 1796, and has been known in Devonshire for upwards of 20 years. It is thus cultivated at Arandel Castle, by Mann. Having thoroughly prepared the ground, and formed it into beds four feet wide, "I draw lines the whole length, three to each bed, and with the end of the rake make a mark (not a drill) on the surface; on this mark I place the onions, ten inches apart; I then cover them with leaf-mould, rotted dung, or any light compost, just so that the onions appear exposed. Nothing more is necessary to be done until they shoot up their tops; then, on a dry day, they are earthen up like potatoes, and kept free from weeds until they are taken up. In the west of England, where this kind of onion is much cultivated, I understand that it is the practice to plant on the shortest day, and take up on the longest. The smallest onions used for planting swell, and become very fine and large, as well as yield offsets; the middle-sized and larger bulbs produce greater clusters." (*Hort. Trans.* n. 395.)

Dymon states (*Hort. Trans.* iii. 305.) that in Devonshire it is planted in rows 12 inches apart, and 6 inches' distance in the row; that the plants are earthen up as they grow, and that the smallest bulbs yield a greater increase than the larger. A similar practice is adopted by some Scotch cultivator (*Cald. Hort. Mem.* i. 343. and iv. 218.)

Wegewood does not earth up, and finds his bulbs acquire a much larger size than when that practice is adopted. (*Hort. Trans.* iii. 493.) The fact is, as we have before observed in generalising on the subject of earthing up, surface-bulbs, as the onion, turnip, &c. are always prevented from attaining their full size by that operation, whatever they may gain in other respects.

Jayin Roses.—Among all the beautiful things which we have seen in these holidays, we have met with none, (a few fine ladies excepted) that have surpassed the Japan roses, (*Candelia Japonica*) now blooming in the green house of Mr. Floy in Broadway. So delicate and so white are the petals, that no lady's hands or snowy white neck, (for it is only the beauty of the virtue and the intelligence of the ladies, that induced us to yield the palm to them) can be compared with them.

Mr. Floy has a very fine collection of the several varieties. Some of his seedlings are of a low red, but we believe they have principally produced red ones, which in our view have no beauty compared with the white. They have not that delicate softness, nor that symmetrical formation and uniform regularity of petals.—*N. Y. Farmer.*

SELF GOVERNING PLOUGH.

This plough, for which the inventor, Mr. Howard, has received a premium from the Massachusetts Agricultural Society, we have had the satisfaction of seeing in operation, and were much pleased with its performances. Its powers greatly exceeded our anticipation. It appeared to regulate itself even better than the common plough is generally conducted, gauging the furrow with mathematical accuracy, and turning it with uncommon neatness. For stony land it is not calculated or intended, that is to say, the governing part; but no farmer, we think, once acquainted with its utility in ploughing land free from large stones, will long hesitate to adopt it. The governing principle, or *passive ploughman*, may be procured for the common plough, as the soil will permit. We have no desire to see people buying every thing that claims the name of an invention, but hope they will liberally patronize this improvement on the most important implement in agriculture, as by so doing they will not only advance their own interest, but will justly encourage and reward the ingenious and enterprising inventor.

Northham Paper.

Silk.—One farmer in Connecticut, estimates that when his mulberry trees, 700 in number, shall have come to maturity, that the females of his family will annually make 300 lbs. of silk. They made 50 lbs. last year, by about 100,000 worms, without feeling any loss of labor. Silk will be extensively produced in the United States, especially in the south.

Decrease of mortality.—It is proved by the returns made under the population acts, that the average mortality in England and Wales, in 1750, was one in every forty of the population. But notwithstanding, the extraordinary case in the intermediate period of what we have been in the habit of considering unhealthy employments, the average mortality in 1810, amounted to only one in every fifty two—and in 1824 to only one in every fifty-eight of the entire population. This diminution of mortality has been going on gradually since 1750, and has been owing to a variety of causes;—partly to the greater prevalence of cleanliness and sobriety among the poor, and the improvements that have been made in their diet, dress, and houses;—partly to the draining of bogs and marshes;—and partly, and since 1800 chiefly, perhaps, to the discoveries in medical science, and the extirpation of the small-pox.—*Edinburgh Review.*

To make a boiled Plum Pudding.—Take a pound of suet cut in pieces, not too fine, a pound of currants, and a pound of raisins sliced, eight eggs, half a nutmeg grated, and a tea-spoonful of beaten ginger, a pound of flour, a pint of milk—beat the eggs first, and add half the milk; beat them together, and by degrees stir in the flour, then the suet, spice, and fruit, and as much milk as will mix it together very thick. Boil it 5 hours.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 18, 1828.

ON FEEDING AND FATTENING CATTLE.

An animal when in a state of rearing may be considered as a vessel open at both ends, in which the supply and the waste being nearly equal it can never be filled; fattening an animal may be considered as an attempt to fill the vessel, and which can only be done by excess of supply. The waste being the same as before, this excess must be great; if it is not so, the vessel may be rendered fuller than before without ever becoming full. An important hint might be taken from this simile by many farmers, who know little of the difference of feeding and fattening. We have known cattle, sheep, and swine kept for months, and fed with a view to fattening them, without their gaining a pound of meat.—*Essay of Jervi.*

With regard to the proper age of cattle for fattening, Mr. Lawrence observes, that "animals arrived at their full age, at least all size, are well known to be the most proper speedily to take on fat, since nature is not then impeded by a double process. Young animals of great substance, and well formed, will likewise fatten to good profit; but they are generally adapted to the gradual plan of gaining, which is prolonged eighteen months or two years. The grazer thus reaps the profits of their natural growth or increase in stature. There is another species of increase, technically styled *growth*: it is the spread or extension of the muscular flesh in full aged animals, of large bone and capacious frame.

Tallow is termed from the surplus nourishment given to animals, beyond what is necessary for their mere physical development; whence it follows, that those which have not obtained their full growth, are fattened with difficulty, and only by extraordinary means. Calves, for example, can only be fattened by great quantities of milk; to which must often be added oats, barley, or oat meal, or the flour of beans or peas; and with all this abundance and selection of food, they yield little if any interperat or tallow. Whereas, oxen at six years of age, with correspondent treatment, give large quantities of that article. Old cattle are also, from loss of teeth, debility of stomach, or other internal disorganization, difficult to fatten. These facts sufficiently indicate what, on this head, ought to be our practice; *to fatten cattle as soon after they had attained their growth as possible.* Oxen generally attain their growth at five or six years, and sheep and hogs at two.

Loudon says, "the age at which cattle are fattened, depends upon the manner in which they have been reared; upon the properties of the breed with a regard to a propensity to fatten earlier or later in life; and on the circumstances of their being employed in breeding, in labor, for the dairy, or reared solely for the butcher. In the latter case, the most improved breeds are fit for the shambles about three years old, and a very few of any large breed are kept more than a year longer. As to cows and to working oxen, the age of fattening must be necessarily more indefinite; in most instances, the latter are put up to feed after working three years, or in the seventh or eighth year of their age. In general it may be said, that the small breeds of cattle are fattened on pastures, though sometimes finished off on a few weeks' turnips."

It has been often asserted, and probably it is true, that it is not profitable, generally speaking, to fatten cattle on any kind of grain. Lawrence asserts, that, "corn (by which is meant oats, barley, peas, beans, wheat, &c.) cannot be used in the fattening of bullocks and sheep, except in seasons of superabundant plenty." Even Indian corn is often too costly a species of food to be used solely or chiefly for the profitable feeding or fattening of cattle, and grass, hay, or roots are said to be the materials which true economy requires.

Though food should be given to fattening animals in abundance, it ought not to be given to such excess as to cloy their appetite. Intervals of resting and exercise must be allowed according to circumstances. Even animals grazing on a rich pasture, have been found to thrive faster when removed from it once a day, and either folded or put in an inferior pasture for two or three hours. Stall-fed cattle and swine will have their flesh improved in flavor, by being turned out into a yard or field once a day; and many find that they feed better, and produce better flavored meat, when kept loose under warm sheds or hammels, one or two in a division. Coarse food may be first given to feeding animals; and as they acquire flesh, that which is of more solid and substantial quality. In general, it may be observed, that if the digestive powers of the animal are in a sound state, the more food he eats, the sooner will the desired result be obtained; a very moderate quantity beyond sufficiency, constitutes abundance;—but by withholding this additional quantity, an animal, especially if young, may go on eating for several years without ever attaining to fatness.—Properly treated, a well fed ox, of moderate size, will feed (become fat) on a rich pasture, in from four to six months; and in stalls, or covered pens, with green or steamed food in a shorter period.

In young growing animals the powers of digestion are so great, that they require food which is less rich, than such as are of mature age.—They also require more exercise. If rich food is supplied in liberal quantities, and exercise withheld, diseases are generated, the first of which may be excessive fatness: growth is impeded by very rich food, for experience shows, that the coarsest fed animals have the largest bones.—"Common sense will suggest the propriety of preferring a medium course between very rich and very poor nutriment."—*Loudon.*

An able writer in treating this subject observes, "with respect to feeding, the first rule is to give little at a time and often; because experience has shown that animals that eat much in a short time, do not fatten so well as those which eat less, but more slowly and frequently. The second rule, is to begin the course with cabbages and turnips; then to employ carrots and potatoes, and lastly, Indian, oats, or barley meal."

It is asserted, that beef fattened on oil cake, raw potatoes, &c. will not be so firm, nor so palatable, as that which is fattened on Indian corn, or other grain. If that be true, (and it probably is), it would be well to commence with potatoes or other coarse aliment, give the animals richer food as they increase in fatness, and finish the course with the richest and most nutritive. In other words, it is well to *feed with the coarser, and fatten with the finer food.* But in every part of the course, occasional changes of diet, will have a tendency to prevent the appetite from being pal-

led, and cause the animal to thrive faster than it would even on the richest food without variety.

It would prove very useful to try experiments on this subject, and publish their results. Let a number of cattle of a similar or the same breed, age, propensity to fatten, as ascertained by handling, &c. &c. be put to fatten at the same time. Let one be fed entirely on potatoes, raw; a second on the same root, steamed or boiled; a third be made one half or two thirds fat on potatoes, and his fattening completed with Indian corn; a fourth be fattened on Indian corn, or corn meal; a fifth be fattened with a mixture of all these kinds of food, given together in the same mess, or in different messes. The first feed in the morning for the last mentioned bullock, might be a small quantity of potatoes, or turnips, the second ruta baga, or mangel wurtel, or parsnips, which are highly recommended. Then, as the last course of the day's feast, give Indian meal, or other food—the richest you have. It would be well, likewise, to try the virtues of sweet apples, which would, no doubt prove a valuable food for cattle. The most important object of such experiments, however, would be to ascertain whether the beef of cattle fattened on potatoes, or other roots, raw or steamed, is equal in quality to that which is fattened on Indian corn. If not, whether an ox may not be made nearly fat enough for profit on roots, his fattening completed on corn, and his flesh be as good as if he had been fattened wholly on corn. And if an ox partly fattened on roots, and his fattening completed on corn, gives as good beef as one wholly fed on corn, the question arises, *how long a time* will it require to give the beef its good quality arising from the corn? We know, as respects swine, that farmers will make them partly fat on any thing which they will devour, and then feed them for some time before they are killed with Indian corn or meal, to "*harden the flesh*," as they express it. And perhaps the same process will answer as well for beef cattle. "We have heard it asserted that the red or La Plata potatoe, given raw to swine makes as good pork as that which is corn fed. Others, say that any kind of potatoe, if steamed or boiled, will make as good pork as can be made of corn. If this be true of pork, why not of beef?"

(To be continued.)

Extraordinary.—The Charleston Patriot of the 4th inst. says, our vegetable market this morning contained Green Peas and Tomatoes, which sold at prices not higher than are given at the natural seasons.

Hemp.—Governor Clinton, in his recent message to the New York Legislature, recommends the cultivation of hemp and flax. He says, "it is the opinion of good judges, if this interest is properly fostered, that *twelve thousand tons* of hemp, worth

\$600,000, may be annually raised in that State; and, that within thirty years, the exportation of that article from the United States, will be equivalent in value to those of cotton."

Indian Cure for Ears Ache.—Take a piece of the lean of mutton, about the size of a large walnut; put it into the fire and burn it for some time, till it is reduced almost to a cinder; then put it into a piece of clean rag, and squeeze it until some moisture is expressed, which must be dropped into the ear as hot as the patient can bear it.

BRIGHTON MARKETS.

Extract of a letter from Boston, respecting the sales at Brighton on Monday of last week, Jan. 7. "The Market, I fear, will not be as good this season as we expected. Cattle come in very plentifully; upwards of six hundred on Monday. About one hundred remained unsold. Of those sold, the best brought \$5.00 to 5.50—but the greater part went from \$4.00 to 4.50." A letter, dated on Thursday last, says, "pork is about half a cent lower than last week." The prices have been declining at Brighton, for two or three weeks, as the following statement will show. Monday, Dec. 24, best oxen, \$6.00, others 4.50 to 5.25. Monday, Dec. 31, best oxen, \$5.75, others \$4.00 to 5.00. Monday, Jan. 7, best oxen, \$5.50, others \$4.00 to 4.50. A few very good oxen sold at prices between the "best" and the "others."—*Hampshire Gazette.*

Females in France.—I see women doing almost every kind of work that is to be done upon a farm. There are full as many women employed in the fields as there are men, and I think even more. They manage and harvest the flax, a good deal of which is grown here. The women appear to do all the turnip hoeing that is required here; but turnips do not seem by any means a general crop; for I see but few of them upon the land. The dress of the women that I see at work in the fields, is coarser than that commonly worn by our laborer's wives and daughters, but it exhibits very little of that raggedness, which characterizes the dress of so large a portion of those who earn their bread by hard work in England.—*Cobbett's ride in France.*

The Dundee Horticultural Society held their Annual Festival Meeting on the 12th of September, when a rich display of flowers, fruits, and vegetables were brought forward in competition, and prizes awarded to upwards of twenty individuals for nearly forty different articles, to Mrs. Thain for the best white currant wine, Mrs. Cutthrie, for the best black currant ditto, and Mrs. Turnbull for the best wine from a combination of fruits.

The Hall was opened to the public at half past one, when an admiring throng, comprising the rank and beauty of the town and neighborhood, honored the Society by their presence. Seventy-six gentlemen sat down to dinner, and afterwards spent the evening in the most convivial and agreeable manner.—*Dundee Courier*, Sept. 11.

Cruelty.—The American Quarterly Review has a long article on Gastronomy, (or the science of supplying the belly). Among the cruelties practised to suit the depraved appetites of epicures, the following are noticed. The Germans and others formerly whipped their pigs to death, to make the flesh more tender—the Moors of Barbary, who eat hedgehogs, rub the back of the animal against the ground till it has done squeaking, and then cut its throat—the Romans killed their swine by thrusting a red hot iron through the body, and they fattened fowls by shutting them up in dark places, cramming them, and stitching up their eyes. Epicures delight in the artificially enlarged liver of the goose, and in France especially, the increased liver is in great request, and the providing of them is a considerable branch of business at Strasburg, Metz, &c. These swelled livers are obtained by a most barbarous practice. The goose is placed before a great fire, and cram-

med with food, but deprived of drink. Her feet are nailed to a board, and she is gradually roasted alive, in order to enlarge the liver. Pies are made of these livers and sent to Paris, Vienna, and even to Petersburg. In the west of Scotland, a gentleman constantly exhibits in his kitchen, a shelf of geese, nailed to the wood by the webs of their feet, and quite close to the fire.—*Hamp. Gaz.*

Steam Engine.—The great ninety inch steam engine, on the consolidated mines in Cornwall, cost at the foundry, two thousand pounds sterling; the expense of putting it up, was four thousand pounds—and the pit work, two thousand more. In twenty-four hours it consumes about one hundred and eighty bushels of coals, which are delivered at one shilling a bushel. In return for this calculable expense, this engine lifts sixty-four gallons of water per stroke, and it can work twelve strokes in a minute.

In noticing the celebration of Christmas, the *Angusta Courier* has added the following *quib* to the number let off on the occasion in that city:—"We cannot help noticing the order and quiet which has distinguished our city during the Christmas holidays, and the respectful obedience shown to all the ordinances of our worthy City Council. It is thought not more than 1000 gallons of egg nogg were drank, 5000 guns fired, and 50,000 crackers exploded."

Fancy Names.—A person named *Wall* was induced to call his first son after his neighbor, *Stone*, in consideration of a present of \$50 from the latter. Another named *Pease* called his son *Green*, as a token of respect for his physician who bore that name. It is said that Mr. *Stone Wall*, after he had been "set up" in business, was torn entirely down by a ruffian named *Rum*; and *Green Pease*, before he had come to maturity, got into hot water by similar means.—*Gardiner Chronicle.*

The Season.—It will be set down as memorable hereafter, that in the year 1828, at the middle of January, there was no frost in the ground at New York; that the weeds, grasses, herbs, flowers, and esculent vegetables are growing, and buds swelling, in the gardens; and that the steam and sail boats are passing between this city and Albany, without seeing ice in the river, or scarcely a vestige of snow on the mountains. There is time enough for severe weather yet; but so far, the weather has been without a parallel for many years.—*N. Y. Statesman.*

¶ An able and useful article on the subject of Economy in Buildings, from "J. M. G." has been received, and will be published in our next.

¶ A gentleman at New Bedford, to whom this country is much indebted for the seeds of rare vegetables and plants introduced at his expense from Europe, is desirous of obtaining a few roots of the *Cypripedium, peculiar to America*, to be sent to St. Petersburg, Russia; likewise a plant or seed of the *Baptisia virginiana*, and the seeds of any new herbaceous plants peculiar to America. Any gentleman who may have either in his gardens or collections, will confer a favor by sending them to the care of Mr. RUSSELL, publisher of the *New England Farmer*.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished at the *New England Farmer* office, No. 52 North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, in as favorable terms as they can be purchased in this country, neatly done up in small papers, at 1 and 12 cts each—warranted to be of the growth of 1827, and of the purest quality. ORNAMENTAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts.

Siberian Parsley.

Just received at the office of the *New England Farmer*, at W. H. S. Siberian Parsley Seed. This plant is perfectly hardy, *not requiring our severest winters*, and would probably be the best sort to sow with grass, as recommended in the last *New England Farmer*, as well as for cultivation in gardens. The Seed was originally procured from Russia, a few years since, by a gentleman in this vicinity. Jan 1.

Dutch Bulbous Roots.

Just received at the office of the *New England Farmer*, a number supply of fine double and single Hyacinths, Tulips, Narcissus, Tuberoses, Jacobean Lilies, Tiger Lilies, Ranunculus, &c. Also, a few POTATOES—ONIONS—with every variety of Garden Seeds, Flower Seeds, &c.

Specimens on the Vine, Pine Apple, &c.

Just received, and for sale at the N. E. Farmer office, one copy of a Treatise on the culture of the vine; with new hints on the Formation of Vineyards in England; with a Treatise on the Culture of the Pine Apple, and the Management of the Hot House. Third London Edition, by William Specively, with eleven engravings.

Early Peas, Tree Onion, Poppy Seed, &c.

For sale at the *New England Farmer* office, fresh Seed of the Large Poppy, Early Peas, Tree Onion, White Clover, Lima Squash, &c. with the greatest variety of Seeds to be found in New England.

Sheet Almanack.

Just published, at the *New England Farmer* office, a Sheet Almanack for 1828.

COMMENTATORS.

Next Commentators each dark passage slum.
The bald a farthing couple to the Sun

Blasphemy.—Nine tenths of the evils that afflict the mass of society, have their source in ignorance; and when it has been shown, that the number of any class of people has increased, it is next to certain that their condition in other respects must at the same time have improved.

Lucy Weston.—It is very pleasant to observe how differently modern writers and the inspired authors of the book of Proverbs, describe a fine woman. The former confine their praise chiefly to personal charms and ornamental accomplishments; the latter celebrates only the virtues of a valuable mistress of a family, of a useful member of society; the one is perfectly acquainted with all the fashionable languages of Europe; the other opens her mouth with wisdom, and is perfectly acquainted with all the uses of the needle, the distaff, and the loom; the business of one is pleasure; the pleasure of the other is business; the one is named abroad, the other at home. Her children rise up and call her blessed, and her husband calls her dear. There is no name in the world equal to this, nor is there a note in music half so delightful as the respectful language with which the grateful son or daughter perpetuates the memory of a sensible and affectionate mother.

Double Dealer.—He may not always directly as what he says, but he perpetually suppresses what he knows, where he has not the boldness to make a direct one; he can imply a suspicion—where a plain tale would put him or his party down, he can be as ambiguous as an oracle, prepared with any sense to mislead his reader, or auditor, and with another to save himself.

Whisker.—In a company of cavalry organized in Chataque county, we find the name of Lieutenant *Whisker*.

"Messrs. Carey, Lea & Carey have received," says the United States Gazette, an abridgement of the U. States, published in London, in 1826, which exhibits a curious specimen of the accuracy of the English in their notions of American geography. A list of the States is given on the sheet; the others to be arranged in—but then we have the following:—

- Delaware* Vermont.
- Florida* N. York.
- Georgia* Indiana.
- Illinois* Kentucky.
- Massachusetts* *Ohio*.
- Michigan* *Pennsylvania*.
- Mississippi* *Virginia*.
- North Carolina* *Washington Territory*.
- Ohio* *Wisconsin*.
- South Carolina* *Florida*.

Spanish Conquest.—The Maryland and Virginia and *Barbados* are all of Tennessee.—Some of it is ruled by the Rocky Mountains, and all of it, therefore, is included within the British possessions.

We took up a French Geography a short time since, prepared for the use of schools, in which "Herringtown" was given as the capital of Pennsylvania, and the author had located the imaginary place upon the river *Spawnt*.

Hilliard & Brown of Cambridge have just published, "The life of John Ledyard, the American traveller; comprising selections from his journals and correspondents." By JAMES SPARKS.

A few particulars in the singular life of Ledyard are well known, and have been often cited as examples of extraordinary energy and decision of mind, and as evidences of uncommon love of adventure and ardor of pursuit. But no general account of his life has been written, nor indeed any thing more than a very brief and imperfect sketch, which was drawn up in England by the secretary of the African Association. This was done a short time after his death, in the year 1790, as a tribute to his memory for having sacrificed his life in promoting the interests of that society. But the writer had scanty materials, and knew hardly anything of Ledyard's history, except during the three last years of his life. The notices contained in Biographical Dictionaries, both in this country and England, are copied from this memoir, and are equally imperfect.

It is understood that Mr Sparks has obtained from different branches of Ledyard's family, and from other sources, his manuscript journals, and many of his original letters, which afford materials for a more full and authentic biography.—From these papers the volume now offered to the public has been prepared. The incidents of his life are extremely various, and many of them excite a strong interest by the enthusiasm, perseverance, and uncommon vigor of mind, which they indicate. He was born in Connecticut, and educated first at Hartford, and then at Dartmouth College, with a view of becoming qualified as a missionary among the Indians. He travelled into the country of the Six Nations, and afterward constructed a canoe with his own hands on the banks of the Connecticut river, at Hanover in which he descended alone to Hartford. The pursuits of a missionary, and the study of theology, not proving congenial to his temper, he embarked on a voyage to the Mediterranean and the West Indies. After returning home, he visited England, joined the British navy, obtained a post in Cook's last expedition, with which he continued more than four years, till it arrived again in England. He was in the skirmish in which Cook lost his life, at the Sandwich islands, and was near the great navigator when he fell. At the close of the American war he came back to this country, having been absent eight years, and was the first to propose a voyage to the Northwest coast. In concert with Robert Morris, he planned such a voyage, but after a year spent in an unsuccessful attempt to procure a vessel and fit it out, the project failed. With letters from Mr Morris and other gentlemen he hastened to Europe, intending there to make an effort to accomplish his wish. For this purpose he visited Spain and France, and more than two years passed away in negotiations with mercantile companies and individuals, but without success. He was intrusted with Jefferson (at that time our minister in Paris) with Lafayette, and with Paul Jones, who encouraged and aided him.

After encountering numerous difficulties, and not succeeding in his project of a voyage to the Northwest coast, he formed the design of going by land from Paris to Bering's Straits, thence crossing to the American continent, and proceeding homeward over the Rocky Mountains, with a determination to explore those unknown regions.

Through the intercession of the Russian minister at Paris, Baron Grimm permission was granted by the empress of Russia for him to pass through her dominions. In London he was patronized by Sir Joseph Banks and other gentlemen of eminence. He went over to Hamburg, thence to Copenhagen, Stockholm, and around the Gulf of Bothnia in the midst of winter to St Petersburg. He arrived there when the empress was on her famous tour to the Crimea, but by the aid of Count Neign and Professor Pallas, he obtained a passport from the proper minister and set off for Siberia. It was so late in the season before he reached the borders of Umschakta, that the governor of Yakutsk would not suffer him to proceed further till the opening of spring. Meantime the empress became suspicious of his designs, and sent two Russian soldiers after him, who brought him back in the winter to the confines of Poland, a distance of more than six thousand miles, where they left him in poverty and wretchedness. He found his way to London, and was again kindly received by Sir Joseph Banks and his other friends. The Association for Promoting Travels in Africa was just at that time instituted. Being defeated in all his attempts to explore his own country, Ledyard eagerly grasped at the proposal to engage under the auspices of this society. He spent a few days in Paris, and then proceeded to Marseilles, whence he sailed for Alexandria in Egypt. At Grand Cairo he had passed several weeks in gaining acquaintance with the language and habits of the people, who travelled in the caravans, and had made an agreement to accompany one of these to the interior, when he was suddenly taken ill, and died in January, 1790, being the first victim in the cause of African discovery, to which so many have since become martyrs.

His Siberian Journal has been preserved entire, and several letters written from Russia to Mr Jefferson and other persons. His celebrated eulogy on women, so often repeated, is so beautifully verified by Mrs Barbauld, was written at Yakutsk in Siberia. This journal also, contains many curious remarks on the character and customs of the Tartars, as compared with the American Indians and the South Sea Islanders, whom he had before seen in various parts of the globe. His journals and letters while he was in France and Spain are hardly less curious, containing observations on men and things often original and always striking. His letters from Egypt to Mr Jefferson and the Secretary of the African Association are equally characteristic. His journal of Cook's voyage, though not a complete narrative, abounds in lively descriptions and pertinent remarks, and his account of Cook's death is drawn up with more vivacity and apparent truth, than any other that has been published. It is believed that the papers, taken together, are worthy of the effort that has been made to rescue them from oblivion, and that the delineation they will afford of the character of their author will not be unacceptable to such readers as love to contemplate the workings of an ardent mind, engaged in noble pursuits, and encountering with fortitude the obstacles incident to great and hazardous enterprises.

Lucerne Seed.

A few hundred pounds of fresh Lucerne seed, by the pound or hundred weight for sale at the N. E. Farmer office.

White Mustard Seed.

For sale at the office of the New England Farmer, the New English White Mustard seed, by the pound or bushel.

NEW ENGLAND FARMER.

No. 27.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ECONOMY IN BUILDINGS, &c.

MR FESSENDEN.—The ground is locked up, the farmer's exertions must relent, and now for him is the time to indulge in thinking, and speculating upon what is passed and what is likely to come. If we look back for twenty-five years, we find that more has been done within that short time, to lay the foundation of great prosperity for agriculture than ever was attempted in any country within the same period. Orchards have been planted all over the land, and shortly this will be a country full of fruit; not only apples, but pears, and the various delicate summer fruits, including grapes. Gentlemen of science and of fortune have given their powerful assistance to collect, and generously to distribute the rare fruits of distant climates; respectable and extensive nurseries have been reared among us, which enable us to find a correct supply at home, and to concentrate there our resources. The cultivation of fruit trees is one of the graces of agriculture; their presence casts a lustre upon the habitation of the owner, and we find that in the various countries of the old world it is attended to in proportion to the perfection to which agriculture has attained; where it flourishes, fruit trees are abundant, and well attended, where it is neglected, they are scarce and desolate. It is within the above period that the various societies for the encouragement of agriculture have been founded; like thrifty branches from a powerful stock, they extend now all over the commonwealth, with great deeds of usefulness already achieved, and promise of incalculable results. As the traveller drives on his way, the land exhibits testimonials that a great revolution has taken place in the mode and manner of farming, and that although the hands of the present farmer are not stronger than those of his grandsire, yet the connection between the head and the hands has got to be better understood, and gives promise of fair results. This, Mr Editor, is the cheering situation in which we are placed, and it is our duty to make the most of it, and to try to find out the means to accelerate that prosperity which the present times seem to be the dawn. I take it for granted that a farmer ought not to be altogether a man of hard labor, but that his situation should be so far comfortable, that the exertions of the body should not preclude that well balanced state of the frame, which admits of habitual freedom, and clearness of mind, so that his various operations may be calculated in the best manner to procure the intended results. We must also admit that improvements are not to be made on the land to any extent, without sufficient and adequate pecuniary means; tools must be purchased, the alluring and treacherous promises of immediate advantages to be obtained, by over cropping the land, must be resisted, and the safer and sounder course of maintaining the soil in its original strength, must be firmly adhered to; and as a general rule many present advantages must be overlooked and sacrificed, when found likely to retard or defeat the

general plan of improvements, which a farmer ought at all times to pursue. Having thus admitted, that the farmer should be free from excessive labor, and the necessity of sufficient ease in his circumstances, to carry on his improvements, we are led to speculate upon the means most likely to place him in that happy situation. As those means, generally speaking, ought not to be borrowed, but should be found within himself, I take the liberty to say, that economy will furnish them. A farmer, by the nature of things, ought to be a man of strict economy, his aim ought to be, habitually to prevent waste, in anything, and in all things. After he has paid seventy dollars for his ox wagon, and forty five for the cart, they should not be left exposed to the ardent sun, nor to the rain, but carefully housed under sheds when not in use. Ploughs and tools should be secured in the same way; but the waste which I have more particularly in view, is what results from the nature and manner of our buildings, all wood! If we embrace at one view, as one great concern, the whole commonwealth, (the cities excepted,) the mind is struck with awe at the consideration of the great perishableness of its habitations.—Houses, barns and sheds all built of wood! taking it for granted, that upon an average those buildings should last three generations, it follows as a matter of course that once in every third generation, all the houses, barns and sheds in the commonwealth (the cities excepted) must be built over again; truly this is a great undertaking; this must dig very deep in the pockets of the parties concerned. And if there are yet a few gaps in our walls, a few rocks in our fields, if our lots are getting bare of timber, no man of common justice will wonder at it.

If a proof was needed of the intrepid industry of our yeomanry, none could be adduced more convincing, than their being able to thrive, notwithstanding the dreadful incongruence of maintaining such habitations. Relieve them of such intolerable burdens, and what a change it would make in their circumstances, and in the state of the country. This manner of building was well adapted to the days of old, it answered the double purpose of clearing the land of some of its timber, and to run up houses quick; now the case is much altered, timber is getting alarmingly scarce, but good building stone abounds, and the resources of the present generation are fully equal, to avail themselves of such a privilege.

It is hard to change old ways, and to adopt new; but if ever there was an imperious call of interest for an alteration, it is in this case. Little accustomed as we are to stone buildings, it may be thought by many that to erect such an one, would be a great undertaking, yet it may be done without either great expense, nor much difficulty. Hammered or chiseled stone is adapted to public buildings, or the houses of the wealthy, and is expensive; but comfortable, decent houses may be built with common stone, such as we would use for good field walls. Such stones laid in strong mortar, will make an excellent building, either by facing the wall with the stones, if fit for the purpose, or by rough casting the wall after it is built. The foundation not to be less than three feet

thick; if granite should be used, it might be split, and pieces selected for the sills and tops of the doors and windows. A farmer would take winter leisure time to collect the materials, and if rigidly conducted, there is no doubt but such a house might be built for the same cost, or very little more, than in the present way. In point of comfort, it would be far preferable, because stone houses are warmer in winter, and cooler in summer; as to the durability, may be said, without incurring the charge of exaggeration, that a stone house covered with tiles, and substantially put up, will last three hundred years, and will require little or no repairs for the first fifty years. In our climate, it happens at times, that very cold weather is succeeded by a thaw, and then severe cold comes again. These changes from extreme to extreme, act powerfully upon the mortar, and will at times loosen it; it would be preferable, on that account, to build facing walls, and avoid rough casting. If the materials for building should be carefully selected, there would be no difficulty to have sufficient stones with a smooth side to lay out, and a good mason will raise his walls, so as to leave but little on the outside to fill up with mortar. In any case a stronger mortar than common, may be made to point the outside of the building. There are, no doubt, various kinds of mortar, or cement, which would answer the purpose; one I will name because I have used it, and found it excellent; the English masons call it blue mortar, from its color, and is made by mixing a small quantity of iron filings, or also the thin scales which fly from red hot iron, when under the hammer upon the anvil, with good strong mortar. It is used for pointing, where the work is much exposed. It should be laid early in the season, because it will take three months to harden, which should be before frost takes place. It will dry to a great degree of hardness, and tenacity, I have never known it to fail, and have been informed that on the forts, in Boston harbor, they have used it, with success, where before, they could get no mortar to stand long.

The great superiority and comfort of stone buildings is sufficiently established, their happy owners may live freed of that continual intercourse with the fire pot, the lumber yard, and the cut nails of all sizes and dimensions. It would save the farmer the trouble to look after his mechanics, the trouble to settle their accounts, the trouble to pay them interest money, and many more troubles which need not be enumerated, because they may be guessed at. The saving him these troubles, would of course save him considerable time, and time is money. His hard earnings would have a better chance to remain among his children, his freed fee from difficulties, would devise better the progressive improvements of his estate, his thoughts would be easy, and altogether confined to his home. The fertility of Ohio, the nominal low price of farms in the thick forest, and the like dreams, never would obscure his better understanding. The more his estate would be free and unincumbered, the more ambition he would feel to better it, and increase its value for the benefit of his family. I am led to consider the perishableness of our buildings, as the great

and leading cause, which has brought many a farmer into debt, into discouragement, and finally to exile himself and family to distant regions, seldom to realize his hopes, and generally to the great loss of the community of which he was a member. I am further led to the persuasion, that agriculture will never reach amongst us to the state of perfection, of which it is capable, until our buildings shall be substantial and lasting, so that they may be esteemed, as steady habitations, for many generations; and not, until then, will landed estate be esteemed as it ought to be, and reach its real value. The attachment of a people to the spot of their abode, is in some considerable measure, influenced by the more or less stability of the buildings. The Arab lives on'er a tent, he attempts no cultivation, and is always ready to move; the house and the barn of the Swiss are substantially built of stone, he cultivates his hard soil to a garden, where the soil is deep, he removes part of it to a barren place to extend his cultivation, and many years often will pass away, before a landed estate is offered for sale. I shall close these remarks by observing that it is much with our buildings, as it is with some things of the human kind, the top is the failing point, and it is from thence that the general ruin proceeds; the leakage of a roof will at first settle on the plates, then circulate down the posts to the eills, and it is so that most of the barns go to destruction; the shingling of a large roof, is a great, a troublesome, and expensive job, of course it is put off, and delayed always too long.

A full investigation of the subject, which I have attempted to sketch in this communication, will, perhaps, convince many friends to the progress of agriculture, that it would be proper, and expedient, for the agricultural societies, to offer premiums, and marks of distinction, to every farmer, who should attempt to erect stone buildings.— This great revolution in the manner of building, must certainly take place in time, not only from the propriety of the change itself, but certainly from the necessity of the case. Timber is wearing away fast, the little that remains is oftentimes converted into fire wood and other waste; the timber of the first rate, in the eastern country, is veeding more and more from the water courses, and from the sea shore, and old trees which were considered a few years since, as refuse, now find their way to the saw mills; why then, not endeavor to accelerate the great revolution? It would be as proper, and profitable, to give premiums to assist to save the remnant of our timber, by building with stone, as it is to give them for planting forest trees, both measures would strike to the same point, and save the country from getting unprovided with the materials, which ship building and various mechanical purposes require. The rapid erection of manufactories, all over the commonwealth, has increased the necessity of saving what timber remains, since their water works and machinery make a prodigious requirement, and for the first quality. The slow growth of a white oak to its maturity, warns us of the necessity to look to it in time.

Another measure which might assist to save timber, would be to favour the introduction of tiled roofs. We have abundance of clay, and it would be as easy to convert it into tiles, as it is to convert pine, cedar, or perishable spruce into shingles; and it surely would be in the end more profitable. The kind of tiles here alluded to are

flat, about twelve inches long, and seven or one half inches wide; about three eighths of an inch thick; the corners are cut off at the lower end, and there is a knob underneath in the centre at the upper end; that knob is about three inches long and three quarters of an inch thick. The roof which is to be tiled, has no need to be boarded, but slats made of common boards, about one inch and a half wide, are niled on the rafters, at the proper distance; on these slats the tiles are laid, resting the knobs on the slats, which prevent them from sliding, the courses then are laid, in the same fashion as shingles, each ascending course covering the joints of the preceding; their combined weight and adhesion, making of the whole cover a firm sheet, which nothing but a great hurricane, like the September blow, would be likely to disturb; in such a case it requires merely to lift the upper tile, to slide under it a new one, where it is wanted, and rest the knob on the slat.

To introduce tiles to your acquaintance, better than by mere description, I had devised in my mind to have had a number of them made, and to have requested of you, Sir, to have taken the trouble of holding them at the disposal of such gentlemen, as might feel an interest in the introduction of this mode of covering, but I have found a greater difficulty to get them made, than I was aware of; the difficulty was, that in baking they got warped, and after several trials during the last summer, all I could get, that were straight, are the few which I take the liberty to send you herewith, for distribution as above. They were baked with other ware, such as pans and pots, and had of course to take their chance among the rest, without an adequate provision for their particular shape and exigencies. Should any person attempt to make a business of tile making, he would of course be prepared with suitable arrangements, and surely would meet with no great difficulty, tile making in Europe being considered as requiring no extra ingenuity. In some parts of England they use tile which have no knobs, but one hole in the centre at the upper end, through which they drive a small oak pin. These would be very suitable for old barns in want of a new covering, because they might be fastened on the boards; upon new buildings, tiles with knobs should have the preference, because the boarding would be saved, and the tiles would be laid quicker, and without risk, the repairs in case of need would also be easier. The rafters of a roof, intended to be tiled, should be braced in proportion to their weight. Tiles of a good quality, may be said to last almost forever, and with an oak frame under them, a building might have a good chance to last any keep in repairs. If tile making should get into fashion, and the article offered at a fair price, there can be no doubt, I believe, but such covering would cost less than shingles, because the boards and the nails would be saved, and the knob tiles laid in a quarter part of the time required for shingling; to these advantages you may add their security against fire, which makes them a very desirable covering for all buildings in the city, as in the country, and an object deserving great consideration with gentlemen engaged in the erection of factories. Wherever clay can be procured, there they can be made. Men used to work that article, as potters and brick makers, could soon initiate themselves into the art and mystery of tile making. They are as lasting as

slate, and as safe against fire, at their first cost would be much less, the boarding would be saved, and they would be laid much quicker, being tight against the weather, without the assistance of either mortar or cement.

With much esteem, I am, yours, &c.
Weston, Jan. 22, 1828. J. M. G.

[To the Editor of the American Farmer.]

POPE'S HAND THRESHING MACHINE—
REMARKS ON LABOUR-SAVING MACHINES
AND PATENT LAWS.

MR. EDITOR,—I lately had an opportunity of viewing an operation of *threshing rice with Pope's improved machine*—the exhibition of which was fortuitous; but the result may be interesting to our southern brethren who cultivate that important staple; and being desirous to contribute my feeble efforts towards promoting the prosperity of our whole country, the following statement and remarks are submitted to your disposal—to pass for what they may be worth.

About a year since, I was requested by Mr. Dabney, the United States Consul for the Azores, to procure one of *Pope's hand threshing machines* for a friend, who cultivated wheat extensively in the island of Terceira; but as my discretion was called on, I delayed a compliance till within a few weeks, when one of an improved construction was presented. With its performances on *rye* I was fully satisfied—the straw being completely cleared of grain with astonishing expedition, considering the small size of the machine, and that the moving power was only one man. There being no wheat within a reasonable distance of Boston, and the vessel that was to take out the machine on the point of sailing, I told Mr. Pope that if it would perform well on *rice*, of which he had a small parcel, procured from the south for the purpose of testing his machine, I would dispense with its action on wheat.—feeling confident from the effect on *rye*, that all reasonable expectations would be realized.

With the labour of one man to turn, and another to feed, this machine threshed *three sheaves*, thirty inches in length, in something less than a minute, affording a peck of clean rice. It appeared that the feeder was not more than half supplied with material, and that the same power would have acted on double the quantity within the time. I must confess, that I was not prepared to witness so complete an operation. Considering the form of a panicle of rice, so essentially different from an ear of wheat or rye, I was apprehensive that a portion of the peduncles or foot stalks would break off and escape the beaters, or pass through attached singly to the grain. But this was not the case. Indeed it does not appear possible to thresh rice more completely with flails, in the usual way, than was demonstrated in this instance; and if we may judge from the result of an experiment so limited, I think it may be safely estimated that such a machine, with the labor of three men and a boy, will thresh from 150 to 200 bushels of rice in a day—and with the increased velocity which may be attained by the application of animal power, an ordinary mule for instance, double that quantity may be turned out.

The numerous threshing machines, and specious models of them, that were exhibited to the Trustees of the Massachusetts Society for Promotion of Agriculture, during a long period that I had the

hour of a session that board, as trustee and vice president of the institution, which proved either complete failures, or, after phenomenal exhibitions and cessation of novelty, "rest from their labors," with attempt at perpetual motion and other abortions, produced by the frequency of inventive genius in our country—the models of which assist to lead the shelves of the Patent Office—induced a degree of caution bordering on scepticism. Certainly no interesting machines have come within my view that inspired any confidence in their general utility, except Pope's—and I never felt a full conviction that even that was capable of producing such important results as those to which I have alluded. This machine promises great durability, occupies not more room, and is as portable as a common fanning machine—is simple, and so cheap as to be at the command of middling farmers—cardinal points which mechanics in general are too apt to overlook. For being encouraged by a venal cupidity in the public, they endeavor to get too much of a good thing, whereby their machines are rendered bulky, complicated, and expensive.

It were superfluous to expatiate on the importance of eliciting the invention of simple and efficient labour-saving machines, in various departments of husbandry, as well as in the arts; but I cannot withhold the expression of my firm conviction, derived in part from facts recently come to my knowledge, that many valuable inventions and discoveries are kept from the light in consequence of the feeble protection afforded that species of property, or the impunity with which it can be pirated under the patent laws now in force. For it is unquestionably true, that great loss or ruin is inevitable to the man who, with a verdict in his favor, prosecutes for an infringement of his patent!—and like a wreck stranded on a barbarous coast, the greater the value of his invention or discovery, the greater the number and potency of deprecators will he have to contend with. Moreover, it is believed, that to the same cause may be attributed the imperfection of numerous machines that have been palmed upon the public. The inventor or mechanic, has little inducement for persevering to bring his machine to the highest state of improvement of which its principles may be susceptible—having no confidence in the law, but rather viewing them as a trap, commences trapper himself; and so soon as he can render it sufficiently plausible to enable him to sell patent rights, grasps at the modicum offered by jobbers—the construction of the machine is assigned to bunglers, and the utility it might possess soon expires.

Upon what moral principle, or maxims of justice the distinction is founded, or why it is, that property created by astonishing efforts of human intellect, united to years of constant toil, when exhibited in the form of inventions or discoveries that in some instances seem to approximate matter almost to mind, and prove of incalculable benefit to society, should by the same community be held so little sacred and receive from their lawgivers merely nominal protection, while property acquired by professional displays of intellect, and every other pursuit, is most rigidly secured, we shall leave to casuists and societies for the improvement of morals, to discover. But such is the fact that the right to inventions, or what is termed patent property, in relation to any other kind, may be correctly compared to a weak and sickly

tree. Hosts of insects see and gorge upon its trunk, fruit and foliage, when not a soul of them, except a few outcasts of their society, dare approach one of the same species that is in sound health and vigor.

It is said to be the boast of our country that her laws are framed to dispense "equal and exact justice to all." We may still hope, that the grand inquest of the nation, will no longer suffer that divine attribute to be defaced by statutes that carry *protection* in their front, but *destruction* to the oppressed who seek for redress under them.

With very cordial esteem,

I remain truly yours,

SAM'L W. POMEROY.

Brighton, Jan. 22, 1828.

Recovery from Suspended Animation.—A case is recorded in the *Bullet. Univ.* by a French physician, M. Bourgeois, showing the importance of never abandoning all hopes of success in restoring animation. A person who had been 20 minutes under water, was treated in the usual way for the space of an hour without success: when a ligature being applied to the arm, above a vein that had been previously opened, ten ounces of blood were withdrawn, after which the circulation and respiration gradually returned though accompanied by the most dreadful convulsions. A second and a third bleeding was had recourse to, which brought about a favorable sleep, and ultimate recovery on the ensuing day. The public will feel much obliged to M. Bourgeois for his perseverance in so interesting a branch of his profession.—*London Weekly Review.*

A Carriage drawn by Kites.—A short time ago the passengers in and on the despatch coach at Alesbury, were surprised a few miles from London, by the appearance of the vehicle of Mr. Pockock, of Bristol, containing two passengers, drawn along the turnpike road by the power of artificial kites. The vehicle was running at the rate of 12 miles an hour.

To counteract the Poison of Arsenic.—Whenever arsenic has been taken internally, by design or mistake, the best medicine is sulphuret of potash (liver of sulphur) dissolved in water. A few scruples should be dissolved in half a pint or a pint of water, and administered a little at a time as the patient can bear it.

Guarding single trees in Parks.—What is the simplest, cheapest, and most sightly mode of guarding single trees planted in parks or lawns from the depredations of deer or other animals?—*Answer.* Thorn branches, tied with hazel or willow shoots, and understocking the pastures.—*London.*

Irresistible Temptation.—Next morning the French commenced firing at us: we were ordered not to return it, but to go down to the edge of the river and lie under cover. Here we lay snug enough—but, as in the fable of the boys and the frogs, no sooner did we venture to put up our heads, than a shower of balls, would whistle past us. This was rather a provoking predicament to be in, especially as we were all burning with thirst and the river was running close by us. One of the men, unable to wait longer without drinking, or wishing to show his courage, jumped hastily up and ran down to the river, filled his canteen, and came back safe and sound, contrary to our expecta-

tion; the enemy, meanwhile, sending their bullets about his ears like hail. The moment our gentleman arrived, he uncorked his canteen with a triumphant air, saying, at the same time, he would now let us all drink; but lo! what was his surprise, on opening it, not to find any water within—a bullet having pierced the side of his canteen, and allowed every drop to escape. At this adventure, although our tongues nearly clove to our throats, we could not resist the impulse of bursting into a loud laugh—so ludicrous was the countenance of the water-carrier, who prudently declined risking his life a second time.

Viscisitudes of a Scottish Soldier.

Splendid Advantages!—The rest of the army, extending from our regiment to the extreme left, had, during the course of the day, obtained some splendid advantages; so much so, that about dusk a general and rapid retreat commenced along the whole of the enemy's line; upon which every part of our army pursued with rapid strides. Our feelings were destined to experience a severe trial, in passing over the identical ground where our slaughtered comrades lay. As soon as the wounded were aware of our presence, they set up faint cries for water, to assuage the burning thirst which is the inevitable attendant of blood gushing wounds; they even invoked our assistance by name. A young man well known to me, implored my aid with the most piteous language; I had only time to ask in what place of the body he was wounded; the reply was, "in the back," by which I knew that it was mortal. Another man, a sergeant, we saw in a sitting posture, with both of his eyes turned out on his cheeks, a ball having entered the side of his forehead; he, too, called for water. Duty—inexorable duty—compelled us to shut our ears to the horrible distress, and pass on as indifferently as if so many sheep bled in a slaughter-house.—*Id.*

Our fathers, where are they?—From official documents recently transmitted to Congress, it appears that four hundred and ninety-one revolutionary and invalid pensioners died the year ending the 4th Sep. last; and it is stated that no returns were received from Delaware, Virginia, East Tennessee, Ohio, Louisiana, Alabama, Michigan, or the District of Columbia.

Heating Hot houses with hot water seems coming into vogue. What is your opinion of the mode? What is the best shape of a boiler for that purpose?—*A friend to improvement.*

We have little doubt of hot water superseding both steam and smoke flues; certainly steam. A wrought-iron box boiler we should think the best; but our correspondent may refer to Messrs. Bailey 272 High Holborn, who are now heating several hot-houses in this way.—*London's Mag.*

Internal Improvement.—By the list we have just completed, of canals and rail-roads in the United States, it appears that there are two thousand five hundred and fifty miles of canal completed, or in a forward state; there are one thousand and twenty-four more projected, and which, it is believed, will soon be commenced forming a line of canal equal to the distance from this city to England. There are five hundred and forty-four miles of rail-road contemplated, or twenty-five miles completed or commenced.—*Penn. Gaz.*

GRASSES.

The following is a list of the articles selected for that valuable work, entitled "Hints for American Husbandmen," &c. published under the auspices of the Pennsylvania Agricultural Society.

On Grasses—Orchard—Rye—Clover—Sainfoin, &c.—their products, comparative values, constituent parts, modes of sowing, managing, quantity, quality of Seeds, and adaptation to particular Soils.

In some plants there is a comparative excess of saline matter, and when such plants are given unaltered with any other to cattle, they are most subject to disease, or continue for a length of time before they improve, however abundant the supply. The following facts, which came within my own immediate observation, may serve as an instance to point out the importance of a mixture of such grasses as possess some difference in the qualities of their nutritive matter; and at the same time they will show that the bitter extractive is efficacious in correcting the over-succulency, or laxative nature of green food, without the aid of dry vegetable fibre.

Two fields were sown down for pasture; one with white clover and trefoil, only, and the other with a variety of the natural grasses, for experiment, with a portion of white clover. The two fields were depastured with sheep. In the inclosure of white clover a considerable quantity of cocksfoot grass grew on the edge of the fence; it was of a very harsh quality, from its unfavorable situation, and consisted almost entirely of culms. In a few days the sheep went to this grass, and ate it down entirely, though there was a profusion of white clover. In the course of time many of the sheep became affected with the disease termed *red water*, of which several died. But in the adjoining field, which contained the natural grasses, *cocksfoot* grass, rough stalked meadow grass, rye-grass, fox-tail grass, and white clover, the sheep were not affected with that, nor any other disease, and they left untouched the stems of the cocksfoot, which were here of a more tender succulent nature, than those on the edges of the other field, which were so greedily devoured by the clover sheep.

It may remain only to observe, that if the hard stalks of the cocksfoot in the clover field had been in sufficient quantity, they would most probably have prevented the disease from attacking the sheep; but this could not have been by virtue of the *dry fibre* only of the culms, because in the adjoining field, where every thing was contrary to disease, the sheep rejected the culms altogether. The dry, or mechanical action of the culms, was here wanting; yet the animals continued healthy, and fattened, because the bitter extractive was to greater proportion in the leaves or herbage than in the culms which they rejected; and also proved beneficial, though combined with succulent food, which could have nothing of the action of the dry hay or straw before mentioned.

The proportional value which the grass at the time of flowering bears to that at the time the seed is ripe, is as 11 to 10; and to the grass at the latter-math, as 5 to 2.

There has often been occasion to observe, that rough grass, when left till the seed be ripe, afford a greater quantity of nutritive matter, notwithstanding the value of the latter-math which is by this means is often greater than the extra quantity of nutritive matter thus obtained; add to this the improving effects of the plants on the seed, by the process of ripening the seed, and the less

palatable nature of the hay. The plants of grass are likewise much weakened by the production of seed, for in all the experiments I have made, the produce of latter-math proved always less, in many instances one-half less, in a given time after the seed crop, than after the crop taken at the time of flowering; I never could perceive, however, that the bad effects extended in any degree to the next following season, the weight of produce being then as frequently superior as equal or less.

Rye-grass appears to have been cultivated previously to the year 1677; besides which, red clover, sainfoin, spurrey, trefoil, and nonsuch, were the only plants then cultivated as grasses, or termed such. And it is only of late years that any other species of the natural grasses has been tried as a substitute for it in forming artificial pastures—as cat's-tail grass (*Phleum pratense*); cocksfoot grass (*Dactylis glomerata*); and fox-tail grass (*Alopecurus pratensis*). The cat's-tail grass appears to have been made trial of before either of the other two, not more than fifty years ago, by Mr. Roque, a farmer at Walhamgreen, near London. The seed of the cocksfoot grass was introduced about the same time from Virginia by the Society of Arts, &c. but no trial was made of it till several years afterwards; it was then called orchard grass; and the merits of which seem to have been first accurately pointed out by the late excellent Mr. Curtis in his several works on grasses.

There has been much difference of opinion respecting the merits and comparative value of rye-grass. It produces an abundance of seed, which is easily collected and readily vegetates on most kinds of soil under circumstances of different management; it soon arrives at perfection, and produces in its first years of growth a good supply of early herbage, which is much liked by cattle. These merits have, no doubt, upheld it till the present day in practice, and will probably, for some time, continue it a favorite grass with many farmers. But the latter-math of rye-grass is very inconsiderable, and the plant impoverishes the soil in a high degree if the culms, which are invariably left untouched by cattle, are not cut before the seed advances towards perfection. When this is neglected, the field after midsummer exhibits only a brown surface of withered straws.

Let the produce and nutritive powers of rye-grass be compared with those of the cocksfoot grass, and it will be found inferior in the proportion nearly of 5 to 18; and also inferior to the meadow fox-tail in the proportion of 5 to 12; and inferior to the meadow fescue in proportion of 5 to 17. In these comparisons, from which the above proportions arose, it was necessary to omit the seed crops from the truth of comparison.

Cocksfoot grass perfects an abundance of seed, and the plants arrive at a productive state as soon as those of rye-grass; hence its superiority over rye-grass, as above, is equally great for permanent pasture and the alternate husbandry; which is not so precisely the case with the fox-tail grass and meadow fescue. One peck of rye-grass, with 14 pounds of clover, per acre, is generally considered sufficient for sowing artificial pastures.

The proportions in which the seeds of the different species should be mixed for permanent pasture:—

Cocksfoot grass (*Dactylis glomerata*) 2 bushels
Meadow-fescue (*Festuca pratensis*) 2 "
Meadow fox-tail grass (*Alopecurus pra-*

tensis) 2 bushels
Rough-stocked meadow-grass (*Poa trivialis*) 2 "
Tall oat-like soft-grass (*Holcus avenaceus*) 0½ "
Meadow cat's-tail (*Phleum pratense*) 15 pounds.
Hard, or smooth fescue (*Festuca durivulva, vel glabra*) 2 bushels
Crested dog's-tail (*Cynosurus cristatus*) 1 "
Nerved meadow-grass (*Poa narvala*) 0½ "
Wood meadow-grass (*Poa nemoralis*) 1 "
Narrow leaved meadow-grass (*Poa angustifolia*) 0½ "
Broad leaved creeping bent, or fiorin (*Agrostis stolonifera, var. latifolia*) 0½ "
Rye-grass (*Lolium perenne*) 1 "
White, or Dutch clover (*Trifolium repens*) 15 pounds.
Bush vetch (*Vicia sepium*) 0½ bushel
Sweet-scented vernal grass (*Anthranthum odoratum*) 0½ "
Perennial red clover (*Trifolium pratense perenne*) 12 pounds.
Achillea millefolium, yarrow 4 "

The proper quantity of grass seed to sow, per acre, is a point of the greatest importance, as regards the expense of the seed, and the speedy formation of the most valuable sward.

(To be continued.)

[From the Rutland Herald.]

Mr. Editor.—Having seen a statement of Mr. Jonathan Dyer's dairy, in your paper a few days since, I find it does not exceed the income of my own, nor some of my neighbors. Therefore, I give you a statement of my dairy, the income of twenty-nine cows, which you may publish if you please.

16 calves killed for veal, averaging \$3	\$48 00
2 calves sold for 5 50	5 50
11 " disposed of at 4 days old at seventy-five cents	8 25
100 lbs. of butter sold in the spring at 9¢	12 50
77 24 lbs. of cheese sold for seven cts. per pound	540 68
800 lbs. of cheese otherwise disposed of, and on hand	56 00
289 lbs. of skim-milk cheese sold for 3½ cents per pound	8 35
200 lbs. and ¾ of butter sold in Troy for 1s. 4d.	33 44
65 lbs. of butter on hand, worth 15 cents	9 75
	<hr/> \$722 47

The slop of the dairy, with about 20 bushels of corn, has made 1500 weight of pork, worth, (after deducting the corn) at \$5 per hundred 65 00

We have sold shoats to the amount of twenty-eight dollars—and have as much worth in shoats at the commencement of the season 28 00

\$815 47

We have used as much milk and butter through the season, as the proceeds of three of the poorest cows. Leaving an income of \$815.47 from twenty-six cows. EDW. WOODRUFF.

Tinmouth, Vt. Dec. 24, 1827.

[To the Editor of the New York Farmer.]

Dear Sir, — In a late number of the New England Farmer, p. 178, I observed a letter from Mr. Prince, giving some extracts from an Horticultural work about to be published by this gentleman. Under the head *Synonymus in Fruits*, he observes: "I have also noticed that a peach which is now selling as a new variety, by the high sounding name of *Emperor of Russia*, is the same fruit known for thirty years past under the unpretending title of *serrated leaved peach*."

As this remark appears to be a sort of oblique hit at me, I shall observe that both the "unpretending title," and the "high sounding name," of this fruit and its variety, were given by me and have been in my catalogue a number of years; and to clear myself from the imputation of "giving new names to old and well known fruit," I shall give you the history of this fruit as far as I know it. In the summer of 1808, I was over in the Jersey, at the English neighborhood at Mr. Paul Saunier's place, and in the rear of his house, and near the edge of a swamp, I observed a natural seedling peach; the leaves were very deeply serrated, differing from any peach I had hitherto seen. I was induced to take a shoot from it, and inoculate a few trees in my nursery, and called it by the name of *serrated leaved peach*. This name was not to my knowledge in any other catalogue at that time. I had not seen the fruit, the original tree being very young. I esteemed it as a curious variety only. In the summer of 1810, Mr. Saunier called over and informed me that the fruit of this serrated leaved peach was very fine and was without doubt, a new sort of peach, differing in all its characters from any other peach he ever knew of. And I here wish to remark that Mr. Saunier was a French gardener and a good judge of fruit, as well as a good practical botanist. It however remained in my catalogue by its former name. I raised many trees of this kind from seed all of which retained the character of the original, in the deep serrature of the leaf. Among these seedlings, was a very fine variety, the fruit being better than the original in many respects; and as all the others were inferior, I rejected them.— And this new seedling variety happening to come in about the time of the fatal disaster of the French army at Moscow, it appeared soon after in my catalogue by the name of the *Emperor of Russia*. I inoculated many of them, and sold them in 1815, by that name, as my catalogue of that date will show. I have been thus particular in the history of this fruit, not for the sake of argument and dispute, but for the sake of information, as it regards the *original name*; and shall consider that I had the right to give both the names myself until better informed. If it was so called 30 years ago, it was unknown to me, although it is not impossible; but it may be so: yet if it was so, undoubtedly some catalogue can be produced to prove this fact; and I expect this proof, or shall conclude it was not the case.

I wish also to observe that in the spring of 1810, I sent some of the trees of the former variety, to Messrs. Lee & Kennedy, of Hammersmith; and in 1822, I sent some of the latter variety to the London Horticultural Society, which appears in their transactions, and in their catalogue, by the name I gave it. I perfectly agree with Mr. Prince, that the "rechristening" of old and well known fruits, is a bad practice, and generally arises from

ignorance of the character of fruits; yet I do not pretend to say that every man who is a private cultivator, may not call his fruit by what name he pleases, not knowing the proper name. But surely practical and experienced nurserymen, ought not to fill up their catalogues with these fanciful names. It ought to be presumed that they would be cautious of new names, until they have proved the fruit, and examined it very carefully.

I remain, dear Sir,

Your obedient servant,

MICHAEL FLOY.

New York, January 5, 1828

[From the Massachusetts Spy.]

ESOPHAGOTOMY.

On the 4th inst. a valuable cow of the Denton breed, belonging to Judge Paine of this place, became choked with a large turnip. Repeated attempts were made to reach it with the arm without success, and objections having been made to the propelling it into the stomach by means of a probang, in consequence of the size and condition of the turnip, (it being frozen) as a last resort, the operation called Esophagotomy (the cutting into the Esophagus or gullet) was proposed and carried into effect by Dr. Blood; who, at the request of Judge Paine, has furnished us with the following account of the operation: "The cow was cast upon the right side, and an incision, three inches in length, was made on the left side of the neck through the skin, directly over the place where the substance was lodged. The fat was carefully dissected away so as to avoid the jugular vein, which soon appeared. Parallel to this vein, the incision was continued with great caution, to avoid wounding the great artery of the neck, as far as the wind pipe, near to or on the posterior side of which, the projection occasioned by the turnip, could be felt. This was cleared of the surrounding fat, leaving three inches of the gullet exposed. Firm pressure was then made on each side of the projection, by the fore and middle fingers of the left hand, so as to give the knife no chance of slipping, by the rolling of the turnip, which it was important to avoid, as the great carotid artery laid in contact with it, and might easily be wounded. One stroke of the knife, between the two fingers that confined the turnip, dislodged it. Three stitches were taken in the gullet, the external wound closed, and ten or twelve stitches taken in it to prevent the oozing from the gullet. A dressing of tow, dipped in equal parts of Galbanum and Burgundy pitch, melted, was applied, closing the aperture entirely. She refused to eat for two or three days, and then rejected meal and water, but greedily devoured the oat straw that composed her bed; and for the reason that the straw was forced into a wad by chewing, and would pass the wound better than a fluid. The result of this operation, proves that it is a safe one, and should be recommended in similar accidents, next to the attempt to extract the foreign substance by the hand; unless the circumstances of the case are such as to warrant the safety of propelling it into the stomach by means of the probang. When the operation is done, the animal ought not to be allowed to eat for three or four days, and then, rowen moistened with water should be the first food; if this is swallowed without much difficulty, the danger may be considered as over."

Curing of hams.—The article called *peru-ano acid*, (or essence of snuff) is much used in the curing of hams, and is preferable to the usual mode, in being a great saving of trouble and expense, and (as we think) favors the quality also. Our mode is as follows: after the hams have been three or four weeks in salt and pickle, take three pints of the acid to one barrel of hams, and mingle it in the barrel with the pickle and salt, and let the hams lie therein for three or four weeks. They must then be washed off and hung up in a garret, or other dry place. They improve first by age, and keep sweet in the hottest weather. After four years experience we can safely recommend this mode.—*Long Island Star*.

A correspondent of the National Gazette, notices as an evil, the custom of charitable, wealthy ladies, in making needle-work and selling it at a reduced price, to aid societies—thereby injuring the industrious females who are compelled to resort to needle work for a support.

A writer in the Essex Register suggests the expedience of a Rail Road between Boston and Salem. The large amount of travel, and the practicability of a road almost level on this route, are strong recommendations to such an enterprise.

N. Y. Canals.—The amount of toll collected on the Erie and Champlain canals in 1827 was \$859,658. In 1826 it was \$702,894—increase in one year \$156,764.

A useful society exists at Walpole, N. H. for the detection and punishment of horse thieves, pilferers and plunderers of gardens and fruit orchards.

A South Carolinian who lately travelled north, with strong prejudices against our manufacturing establishments, visited those at Dover, N. H. and returned home almost a convert to the "American System." He says:

"Though I would not advocate exclusive benefits or privileges to any, I would firmly advocate an extension of the fostering care of Government, and all the aid it can consistently render, in protecting this great interest.

"When I see one single concern in the North, will require each year from the Southern States three thousand bales of Cotton; from Virginia or Maryland, 800 barrels of Flour; from Pennsylvania, 1000 tons of Coal, and 30 bhd. Quercitron Bark, thousands and thousands of gallons of Oil from Nantucket; bleaching powders, acids, and all the variety of chemical preparations, from wherever they can be furnished; and all this for its own immediate consumption, without reference to the wants of the population connected therewith; and at the same time uniting us more closely in bonds of mutual dependence and mutual regard—I will pray for her prosperity, and contribute my feeble efforts for that object.—*Charleston Courier*.

The steamboat Columbia, employed in carrying the mail between Mobile and New Orleans, was entirely destroyed by fire on the night of the 20th ult. The master, crew, and passengers, had barely time to get ashore, leaving the letter-bag, containing the great Northern mail, clothing, and every thing else to the flames. The boat is believed to have been designedly set on fire.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 25, 1828.

ON FEEDING AND FATTENING
CATTLE.

[Continued from page 206.]

It has been ascertained, by repeated experiments, that food for swine, fermented till it becomes a little acid, will go farther and fatten the animals faster than unfermented food of the same quality. But, perhaps, it is not generally known, that acid food is valuable for neat cattle. *Bordley's Husbandry* asserts, that "oxen made half fat, or in good plight, on grass or turnips, are then very highly, and soon finished, in France, upon a sour food thus prepared: rye meal, (buck wheat or Indian corn meal may be tried,) with water is made into a paste, which in a few days ferments and becomes sour; this is then diluted with water, and thickened with hay, cut into chaff, which the oxen sometimes refuse the first day, but when dry they crink and prefer it. All the husbandmen are decidedly of opinion, that they fatten much better because of the acidity. They give it twice a day, and a large ox thus eats twenty-two pounds a day. Make (Indian) meal, or maize steeped till sour, should be tried. This sour mess is given during the last three weeks of their fattening, and they eat about seven and a half bushels of meal, value four dollars."

In attempting this mode of preparing food for cattle, care should be taken that the process of fermentation be not carried too far. The paste should not be permitted to become mouldy, nor the liquid food to be in the slightest degree putrid. It is best used in that state called the *saccharine* fermentation, or at farthest should not be suffered to pass the *vinous* fermentation.

There is, doubtless, good management in waiting till the animals become "half fat," or in "good plight," before they are fed with acid food. Acids or alcohol create appetite by stimulating the stomach, but if long continued they weaken the digestive powers, and in time injure, if not destroy, the tone of the stomach. The animal will then be afflicted with a disease similar to what in a human subject is denominated dyspepsia, and it will be hardly, if at all possible, to fatten him. The constitution of an ox as well as that of a human subject, may be destroyed by inactivity and rich food, and it is only near the last stage of his preparation for the butcher, that a fattening animal should be treated like an *apicure*, and indulged with as much as he can eat, of rich and high seasoned food. Store keepers should neither be too rich nor too abundant; and it is said, that if an ox is once made fat, and then loses his flesh, it is nearly or quite impossible to fatten him a second time. If young cattle are kept in rich pastures in summer and are poorly fed in winter, they not only lose flesh, but their disposition to acquire it. To such cattle, Mr. Lawrence alludes, when he says, "it is extremely imprudent, indolently to continue at large keeping animals which do not thrive. The first loss is always the least."

"Some cultivators will keep and summer-fat a considerable quantity of stock, but either neglect or seem ignorant how to provide winter provisions of sufficient quantity and quality for their support; the evil consequence of their error, is, that they are usually obliged to part with a considerable quantity of stuck half fat, at great disadvantage, on

the approach of winter; and of that which they retain, some are fed at an expense too great, whilst the bulk are left to encounter hunger, wet, cold, and to lose as much per head during the winter months as they are likely to gain in those of the following summer. But his plan of subjecting cattle to loss, or even to remain stationary, during the winter, is a great public and private disadvantage, partaking nothing at all of infortune, but wholly of error and neglect. The business of fattening may, and ought to proceed equally in winter as in summer; and in store-feeding of cattle, the practice of keeping them hard, as we phrase it, (that is) exposing them, half fed, or half famished, to all the rage and inclemency of the elements, is absurd in the extreme. These scape goats pay nothing; but cattle comfortably wintered, and kept in good store condition would pay something; particularly, by requiring afterwards, much less time to fatten; and is it not our object to make the most and the speediest profit from them?*"

"Stock cattle," says Mr. Bordley, "are kept;" others are fattened. The feeding is different.—Cattle kept, need no kind of grain, nor even hay, unless to cows about calving-time. *Straw* with any *jelly* food, such as roots, or "drank," abundantly suffices for keeping cattle in heart through winter, provided they are sheltered from cold rains. Mr. Bakewell kept his fine cattle on *straw* and *turnips* in winter. A *drank* for keeping may be thus made; roots, chaff, or cut straw and salt, boiled together in a good quantity of water, the roots cut or mashed. The cattle drink the water and eat the rest. Drank for fattening cattle, thus; roots, meal, flax-seed, chaff or cut straw, and salt, well boiled together in plenty of water. If given warm, not hot, it is better." The same author says, "hay, meal, and linseed jelly, with drank, must be excellent food in stall-fattening. Linseed jelly is thus made: seven parts of water to one of flax-seed, steeped in a part of the water 48 hours, then add the remaining water, cold, and boil gently, two hours, stirring constantly, to prevent burning. It is cooled in tubs, and given mixed with any meal, bran, or cut chaff. Each bullock (large) has two quarts of jelly a day; equal to a little more than one quart of seed in four days."

The following has been used by Col. Jaques, at Charlestown, (Mass.) with the best success for fattening cattle:

Take of roots, either carrots, mangel wurtzel, potatoes, or ruta baga, (cut fine), two bushels—wheat bran, one bushel—powdered oil-cake, half a bushel—English hay salt hay, and straw, either barley, oat, or rye straw, cut, of each, seven bushels—water ten gallons; let them be perfectly mixed.

The above quantity, has been found sufficient for twenty one head of horned cattle, (part of which were full aged, and so down to yearlings) twenty six sheep, and one Jack ass; besides four horses having each half a bushel in the morning. The four horses had long hay at night; and if they labored hard, they had some grain in addition. This feed was given at sun rise, and again the same quantity at sun-down, and no other food given. After each feed, the manger being licked up very clean, a small quantity of salt was strewed in the manger, to all except the horses; they

were salted three times a week. After this, all the animals were corried, or carded and brushed, and then watered. By this mode of feeding, the mangers are left very clean, and the cattle's appetites appear as good when they have finished eating what is given them, as when they begin their meal; and they were all in good health and high condition in flesh. When the roots were carrots or mangel wurtzel, the cows gave nearly or quite as much good rich milk as when at common grass feed.

The cattle looked so fine, and the mangers were so clean, that the herdsman was frequently questioned to know if he did not feed between those meals, as it was thought not possible for the cattle to be kept in such high condition without more food.

Col. Jaques moreover informs us, that in consequence of his not being supplied for a number of days with salt hay, he supplied its place in the mixture with good English hay; but there was, in consequence of this alteration, a visible falling off in the condition of the animals; they however recovered their thriving condition again, on restoring the salt hay to the mixture. He thinks that the salt hay is useful in the compound, by exciting some degree of fermentation in the stomachs of the animals, by which saccharine and nutritious matter is developed.

A great advantage in feeding cattle, may in many cases be gained by boiling or steaming their food. Whether the advantage will more than balance the expense and trouble of the fuel, and preparation, depends on the price of fuel, labor, &c.; and it is a question on which every cultivator must decide for himself. We believe that few persons are sensible of the nature and extent of the gain which accrues from *cooking* some sorts of food for feeding domestic animals. It is a fact, which, perhaps, is not sufficiently known or realized, that water, in boiling *farinaceous* substances, not only prepares them for easier digestion, but by combining with them, becomes, by a chemical process, a valuable nutritious matter. Thus a pound of Indian meal, or of rice, when boiled gives more nourishment to man or beast, than several pounds in a raw state. Count Rumford, says, "from the result of actual experiment, it appears that for each pound of Indian meal employed in making *hasty pudding*, we may reckon *three pounds nine ounces* of the pudding."* And again, "three pounds of Indian meal, three quarters of a pound of Molasses, and one ounce of salt, having been mixed with five pints of boiling water, and boiled six hours produced a pudding which weighed *ten pounds and one ounce*."† The gain in weight in boiling rice is still greater. There can be no doubt that these mixtures must contain much more nourishment as well as more substance when boiled, than when raw; and as the additional weight must have been derived from water, incorporated with the constituent parts of the raw pudding, during the process of boiling, it would seem that a part, at least of the additional *nutrition* must have been acquired from the same source. It has also been ascertained, by experiments repeatedly made, that Indian corn and potatoes boiled or steamed, are more valuable for feeding swine than the same articles given raw. But whether Indian meal or other articles of sim-

* New Farmer's Calendar.

† Drank is a word used by Count Rumford for distinguishing this composition from simple water.

* Rumford's Essays, vol. i. page 256—Boston Edition.

† Ibid. Page 251.

lar kind fermented, are as valuable as the same articles boiled, is a question which needs experiments to furnish data for its decision. But in all cases, care should be taken to use the *drank*, or fermented mixture, while it is yet sweet, after fermentation has commenced; and at farthest when it is just beginning to be sour.

We shall close these remarks with an article taken from the Farmer's Journal, printed in London, which we have already inserted [vol iv. page 210.] but republish for the benefit of recent subscribers: *Winter food for cows.* M. Chabert, the director of the veterinary school of Alfort, had a number of cows which yielded twelve gallons of milk every day. In his publications on the subject, he observes that cows fed in the winter upon dry substances gives less milk than those which are kept upon a green diet, and also that their milk loses much of its quality. He published the following receipt, by the use of which his cows afforded him an equal quantity and quality of milk during the winter as during the summer: Take a bushel of potatoes, break them whilst raw, place them in a barrel standing up, putting in successively a layer of potatoes and a layer of bran, and a small quantity of yeast in the middle of the mass, which is to be left thus to ferment during a whole week, and when the vinous taste has pervaded the whole mixture it is then given to the cows, who eat it greedily.

To prevent the Effects of Poison of Lead on Painters, Glaziers, &c.—The physicians and surgeons of the Bath Hospital, in England, ordered the following cautions to be made public, to be observed particularly by printers or compositors, plumbers, glaziers, painters and other artificers.

To maintain the strictest temperance respecting distilled spirits, which had better be altogether forborne. To pay the strictest attention to cleanliness; and never, when it can be avoided, to daub their hands with paint, and particularly never to eat their meals nor go to rest without washing their hands and face. Not to eat or drink in the room or place wherein they work, and much less to suffer any food or drink to remain exposed to the fumes or dust of the metal in the rooms or warehouses. As the clothes of persons in this line (painters particularly) are generally observed to be much soiled with the colours they use, it is recommended to them to perform their work in frocks of ticking which may be frequently washed, and conveniently laid aside, when the workmen go to their meals, and again put on when they resume their work. Every business which can, in these branches, should be performed with gloves on the hands; and woollen or worsted gloves are recommended, as they may be often washed, which they should always be after being soiled with paint or even by much rubbing against the metal. Caution is necessary in mixing, or even in unpacking the dry colours, that the fine powder does not get into their mouths or be drawn in by their breath. A crape covering over the face might be of service, but care should be taken to turn always the same side towards the face, and to clean or wash it frequently. All artificers should avoid touching lead when hot; and this caution is especially necessary for printers or compositors, who have often lost the use of their limbs by handling the types when drying by the fire, after being washed. Glaziers' putty should never be made nor moulded by hand. An

iron pestle and mortar would work the ingredients together at least equally well, and without hazard.

AGRICULTURAL LIBRARIES.

The Editor of the Columbian Reporter, in copying Mr Howard's Address from the New England Farmer of the 11th inst. accompanies it with the following remarks:

It is but a few years since, that books or publications of any description, relating to agriculture were derided every where by practical farmers.—It seemed not to be admitted that husbandry could be improved in the same way in which other arts had been advanced. A knowledge of the best modes of cultivation, could be obtained, in the opinion of most practical farmers, only by those who wrought the earth; and each, it would seem, thought his own way as good as any which had been or could be adopted. These opinions have, within a few years, happily been giving way to more rational, enlightened views. As evidence of the existence of better opinions on the subject of agriculture, we have noticed with much satisfaction the establishment of an Agricultural Library Company, in a neighbouring town, at the 1st annual meeting of which, this Address was delivered. This is the first association of the kind we have known, and it is creditable to the community in which it originated. The example may be advantageously followed in other places. Mr Howard is an intelligent, practical farmer, and it is gratifying to see such men combating opinions, (as the latter part of the Address more particularly does) which many engaged in the same pursuits have held, and probably still hold. The Address is worthy the notice of all who feel interested in the prosperity of agriculture.

Mr PEsSENDEN—I wish to inquire through the medium of your useful paper, of some of your able correspondents, whether the piths from cattle's horns may not be worth pounding, or grinding for manure, and what kind of soil would be most benefited thereby; also, whether the bark or tan from tanneries, may not be beneficial to some soils, or be worth burning for the ashes for manure.

Jan. 13, 1828. Yours, D. J

CARD.

Mr A. PARMENTIER, the gentleman whose success in trying out Gardens and Pleasure Grounds is so well known, would wait on such Gentlemen in the vicinity of Boston as may wish his services in the course of the winter, provided immediate notice was given at the office of the New England Farmer.—His business will not permit him to leave at any other season; and in fact the season when there is no foliage on the trees, is more favorable for correct plans than any other. The expense attending the visit will be considerable, and it is hoped that those who wish to improve their grounds, will embrace this opportunity.

NEW YORK, JAN. 22, 1828.

AGRICULTURAL BOOKS.

For sale at the office of the New England Farmer, a variety of standard works on agriculture, horticulture, gardening, breeding of cattle, &c. among which are Deane's New England Farmer—Farmers' Assistant—Sinclair's Code of Agriculture—London's Encyclopedia of Agriculture—Memoirs of the Pennsylvania Agricultural Society—Hints to American Husbandmen—Lawrence's New Farmer's Calendar—Thacher's Orchardist—Coxe on Fruit Trees—Hayward on Horticulture—Fruit Grower's Instructor—Speechy on the Vine—M'Mahon's Gardener—Cobbett's American Gardener—Cobbett's Cottage Economy—Cobbett's Ride in France—Hogg on the Culture of Flowers—Kirwan on Manures—Bard on Sheep—Marshall on Gardening—Nicol's Villa Gardener—Thorburn's do.—Holdich's Essay on Weeds—Agricultural Reader—Bonner on Bees—Baker's on Wool—Gray's British Plants—Nuttall's Botany—Torrey's Botany—Farmer's, Mechanic's, and Sportsman's Magazine, &c. Agricultural Libraries and others supplied on favourable terms.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished at the New England Farmer office, No. 32 North Market street, Boston, with 3 boxes containing a complete assortment of the seeds most used in a kitchen garden, in as favorable terms as could be purchased in this country, neatly done up in small papers, at 6 and 12 cts each—varieties adapted to the growth of 1827, and of the *most quality*. OXLEYMAN'S FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts.

Sheet Almanack.

Just published at the New England Farmer office, a Sheet Almanack for 1828.

Account Books, &c.

Just manufactured a complete assortment of Account Books made of the best material and in the most approved modern style, adapted to every capacity of business. *Small Books, Bibles, &c.* Paper of all kinds; the greatest variety at *retail* prices, at No. 96 and 98 State street, two doors east of Merchants Row, by JOHN MARSH.

J. M. is agent for P. Barnes' Quill and Water Manufactory New York. Also for Wm. Grubb's celebrated Medicine, and will supply all orders for their articles at their prices.

Dutch Bulbous Roots.

Just received at office of the New England Farmer, a further supply of low double and single Hyacinths—Tulips, Narcissus, Taberones, Jacobean Lilies, Tiger Lilies, Romanus, &c. Also, a few POLYANT. ONIONS—with every variety of Garden Seeds, Flower Seeds, &c.

PRICES OF COUNTRY PRODUCE.

Corrected every Thursday evening.

MISCELLANIES.

Juvenile Excesses.—The excesses of our youth are evils drawn on our old age, payable, with interest, about thirty years after date.

Good Manners and Good Breeding.—Good manners are the art of making those people easy with whom we converse; and whoever makes the fewest conscious uneasy is the best bred in the company. There is, however, an affected suavity of address, aawkish and stiff manner, which looks like hypocrisy and flattery, is more disgusting to people of sense than almost any breaches of decorum, which do not indicate an intention of giving offence.

Pride, ill nature, and want of sense, are the three great sources of ill manners; without some of these defects, no man will behave himself ill for want of experience, or what is called knowledge of the world.

Health and Pility.—Cheerfulness is the best promoter of health. Repining and secret murmurs of the heart give imperceptible strokes to those delicate fibres of which the vital parts are composed, and thus incessantly wear out the machinery of which the human frame is constituted.

Hard Words.—To say what you are certain will give unnecessary pain, is not only a breach in manners but in morals; and he who wantonly wounds the feelings with words far bitter than a warrior's would wield the tomahawk and scalping knife if he could with impunity.

A Beer Warning.—We are informed by a certificate on our Southborough that on the 7th ult. Doct. B., of that town received a letter, of which the following is a copy:

"Sir—I consign my remains to be dissected at discretion, at the Medical College.

Case.—Tedium Vigæ or certain cure for intemperance has induced me effect it. No obsequies are asked. In the pine grove near Mr. E. Flag's I shall be found!

The signature we purposely omit. On examination, the body was indeed found in the place pointed out. It appeared in evidence, that he drank about a quart and half a pint of rum at once, which produced insensibility and apoplexy, followed by death in about 24 hours; thus adding another victim, sacrificed at the shrine of intemperance, and affording another warning to those who are addicted to similar habits.—*Worcester Spy.*

Extraordinary account of a Shark.—We remember, some years ago, while sitting on the quarter deck of a West-Indian man, borne rapidly along before the trade wind, and the captain and passengers were amusing themselves by telling stories and cracking jokes to beguile the sameness of the voyage. It came at last to the turn of a gentleman, remarkable for his love of cigars and taciturnity; one who enjoyed a good anecdote, but abhorred the trouble of relating it himself. He was, however, so strongly importuned on this occasion that without much reluctance, he related the following interesting fact, by fits and starts, filling up each pause by vigorous whiffs of his favorite weed:—

In the year 1820, the good ship Rambler sailed from Greenock with goods and passengers, towards Jamaica. She had crossed the tropic, and one day, when nearly becalmed, the steward, who had the care of the captain's plate, had occasion

to dip into a box of spoons and other articles in a bucket, and thinking he had taken them all out of the water, he chucked it over the gangway, when to his vexation, he found he had thrown out with it a valuable silver table spoon. He saw it shining through the clear blue ocean, and wavering from side to side as it sank from his view. Several sharks had been observed near the ship, and it is known they generally dart upon anything white, a piece of rag often serving for a bait. He did not, however, observe any of them near the spot at the time;—and the captain being a testy man, he kept the secret of the loss to himself, and the matter was soon forgotten.

The ship in due time reached Jamaica, and when the circumstance became known, the value of the spoon was deducted from the wages of the steward. The vessel lay some time at Kingston, received on board a cargo of sugar, and proceeded on her homeward voyage. When crossing nearly the same spot on the aqueous world where the spoon was lost, a number of sharks again showed their tail fins above the water as they cut along the ship's side, or in her wake; and a shark hook being baited with a piece of salt pork, was lowered over the stern. Presently one of the largest of these devouring monsters, or as the sailors call them, "Sea Lawyers," half turning on its side, took the huge bait into his pig-like but tremendous jaws, and was securely hooked. The fish was with difficulty hauled alongside and hoisted in upon deck, where it flapped about and showed prodigious strength and tenacity of life. When its struggles were ended by a blow on the head with a mallet, one of the men proceeded to open it. His jack-knife soon came in contact with something in its belly, and—"sai!" the narrator, with earnestness, "what do you think was really found?"—"Why the spoon of course!" exclaimed the listeners simultaneously. "The spoon!" he rejoined with a smile, "No! No!"—"What then?" they hastily enquired—"Why, nothing but the entrails, to be sure!" The taciturnity of our waggish messmate was not again disturbed for another story during the voyage.

A cow six years old belonging to Mr. Ezra Wetherbee, of Harvard, was slaughtered on the 10th inst. weighing eight hundred and eighty-four pounds! She had been milked during the present winter, and on the morning she was killed, gave more than two quarts of milk. The tallow weighed one hundred and twenty-three pounds.—*Concord Gazette.*

At Macon, in Georgia, on Christmas day *Hutchinsons* were exposed for sale in the market.

The centre of gravity.—Two thirds of our ordinary motions are governed by the habitual necessity we find of preserving the centre of gravity. When a man rises from a chair, he is seen first to bend the body forward, so as to bring the centre of gravity over the feet or base, and then he lifts it up. If he lift too soon, that is, before the body be sufficiently advanced, he falls back again. A man standing with his heels close to a perpendicular wall, cannot bend forward to pick up anything that lies on the ground near him, without himself falling forward, because the wall prevents him from throwing part of his body backward, to counterbalance the head and arms that must project forward. A man little versed in such matters, offered ten guineas for permission to try

under these circumstances, to possess himself of a purse of £20 laid before him; he of course lost his money.

The painful affection called sea sickness, has a relation also to this topic. Man requiring always to maintain his perpendicularity, incessantly regulates and ascertains that point by the fixed and known position of objects about him. Hence, on shipboard, where the lines of the masts, windows, furniture, &c. are constantly changing sickness, vertigo, and other affections of the same class, are common to persons unaccustomed to ships. Many experience similar effects in carriages and in swings, or on looking from a lofty precipice, where known objects being distant, and viewed under a new aspect, are not so readily recognised; also in walking on a wall or a roof, in looking directly up to a roof or to the stars in the zenith, because then all standards disappear; on walking into a round room, where there are no perpendicular lines of light and shade, as when the walls and roof are covered with a spotted paper without regular arrangement of spots; on turning round as in walking on, or on a wheel; because the eye is not then allowed to rest on the standards.

When Dr. Franklin had approached to the very close of his life, he reasoned thus coolly with a friend; "Death is as necessary to the constitution as sleep, we shall rise as refreshed in the morning. The course of nature must soon put a period to the present mode of existence. This I shall submit to with less regret, as having seen during a long life, a good deal of this world, I feel a growing curiosity to become acquainted with some other. I can with cheerful confidence resign my spirit to the conduct of that great and good parent of mankind, who created it, and who has so graciously protected me from my birth to the present hour."

Newburyport Herald says, that "a family of interesting children in that town came nigh being suffocated a few nights since, by means of a warmer with ignited charcoal being placed in a chamber without a fire-place, where they were in bed."

Steel.—A Mr. Mackintosh, in Scotland, has lately taken out a patent for a new process of making steel, by impregnating the iron at a higher temperature than heretofore, with carbon in a gaseous form.

Lucerne Seed.

A few hundred pounds of fresh Lucerne seed by the pound or hundred weight, for sale at the N. E. Farmer's office.

White Mustard Seed.

For sale at the office of the New England Farmer, the best English White Mustard seed, by the pound or bushel.

Siberian Parsley.

Just received at the office of the New England Farmer, a few lbs. Siberian Parsley Seed. This plant is perfectly hardy, standing our severest winters; and would probably be the best sort to sow with grass, as recommended in the last New England Farmer, as well as for cultivation in gardens. The Seed was originally procured from Russia, a few years since, by a gentleman in this vicinity. Jan. 4.

Early Peas, Tree Onion, Poppy Seed, &c.

For sale at the New England Farmer's office, fresh Seed of the Large Poppy, Early Peas, Tree Onion, White Clover, Lima Squash, &c. with the greatest variety of Seeds to be found in New England.

Published every Friday, at Three Dollars per annum, payable at the end of the year; but those who pay within sixty days from the time of subscribing, are entitled to a deduction of Five Cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

PAINTING OF THE BOSTON ELM.

We have been lately favored by Messrs. THORBURN & SON, with a copy of the following Letter, to the Secretary of the Caledonian Horticultural Society, which accompanied a painting of the Great Elm on Boston Common, presented by them to the Society.

(COPY.)

PATRICK NEILL, Esq.

Sec. Caledonian Hort. Society.

SIR—G. Thorburn & Son and the owners of the Boston Elm, have much pleasure in forwarding by the care of Capt. Peck, of the ship Camillus, a copy of that grand production of nature which still adorns the metropolis of Massachusetts. We send it with the hope that you will allow it a place in the rooms of your valuable institution as a token of the good will that exists in America for the welfare of Scotland, the land of BURNS, of CURRIE, and of WALTER SCOTT.

We further beg the Society's acceptance of a small box containing some curious specimens of Indian Corn, to the examination of which you will see some of Nature's prettiest freaks; also a few varieties of our most esteemed Melon seeds—two or three sorts of Flower seeds, including two beautiful newly introduced annuals from the west; the *Centaurea Americana* and *Euphorbia variegata* are delicate and will in the outset require the aid of the hot bed.

We have requested our friends D. Ferguson & Co. of Greenock, to whom the boxes are consigned, to forward to you with despatch, and hope they may reach you in good order.

We are sir, yours, &c.

G THORBURN & SON.

New York, Jan. 10, 1828.

MULBERRY TREES.

MR FESSENDEN—Having occasion to examine a file of old news-papers, I find in the Boston Evening Post, printed by Thomas & John Fleet, April 13, 1772, the following notice of an attempt to cultivate the mulberry tree; it would doubtless gratify the public, could they be made acquainted with the result of that experiment.

Plymouth, Jan. 25, 1728. Yours, J. T

"The public were advertised in the supplement of Messrs. Edes and Gill's Gazette of August 15, 1760, that a gentleman in Boston, had deposited one hundred dollars in the hands of the Selectmen of this town, to be by them distributed as premiums to encourage the raising of mulberry trees in this province, in the following manner, viz: To the person that shall have raised from the seed the largest number of said trees in the fall of the year 1771, being two years and five months old at least, 40 dollars. To the person who shall have raised the next greatest quantity, 30 dollars. To the person raising the next largest number, 20 dollars: and to the person who shall have raised the next greatest quantity, 10 dollars. provided certificates are brought from a justice of the peace, ascertaining the number and age of said trees; and that the persons receiving these premiums give the Selectmen their several obli-

gations to spare to any inhabitant of this province applying within eighteen months from the date hereof, ten trees at least, for each dollar money per tree, until they have parted with one half of the trees mentioned in the respective certificates. Agreeable to the foregoing advertisement, the Selectmen after examining and comparing the certificates which have been transmitted to them, have adjudged the first premium to Mr Loammi Baldwin of Woburn; the second premium to the Rev. Mr Jason Haven of Dedham; the third to Mr John Hay of Woburn; and the fourth to Mr George Sprigs of Boston: and the Selectmen hereby notify them that they will be ready, at their room in Faneuil Hall, on the three following Wednesdays, at 4 o'clock, afternoon to receive their several obligations, and pay their respective premiums, agreeable to the desire and engagement of the gentleman who has thus generously excited the attention of the public to an article of produce as natural to our soil as it will be profitable to the farmer; and which it is hoped will be so encouraged, as in a few years to afford sustenance for such a number of industrious insects, as will make the article of raw silk no inconsiderable branch of export from this province.

By order of the Selectmen,

WILLIAM COOPER, Town Clerk.
Boston, April 8, 1772.

N. B. Besides the trees raised by the persons above named, many thousands have been raised by those who were not entitled to the bounty, the trees not being of the age prescribed in the advertisement, though now fit to be transplanted; and if the farmers in the neighboring towns are made acquainted, a considerable number would doubtless meet a quick sale. The mulberry tree, as Dr Ehot in his essays upon field husbandry observes, is of the quickest growth; is durable as the red cedar, and may be used for ship timber, window frames, gate posts, &c. and is very fit for chests of drawers, desks, tables and other joiner's ware. If these trees are principally intended to produce food for the silk worm, it is best they should be planted in hedge rows, as the leaves may then be gathered by women and children.

LUCERNE.

MR FESSENDEN—I am much pleased with the description given by your correspondents of the value of *Lucerne*, and should like to be informed, through the medium of the Farmer, whether this grass can, probably, be successfully cultivated, as far north as the county of Grafton, in New Hampshire. Soil of the description named by Judge Buel, is here found in abundance, but whether our long and severe winters, will have any other, or more injurious effect, than to shorten the term of its annual growth, and lessen the number of cuttings, I am not informed.

Respectfully yours,

Piermont, N. H. Jan. 21, 1828. J. S.

Remarks by the Editor.—To the above query we reply that in all trials which have been made of this grass in this country, so far as our information extends, it is not injured by the cold nor the changes of our climate. John Lowell, Esq.

President of the Mass. Ag. Soc. in a communication published in the current volume of the New England Farmer, page 26, says "I have already ascertained that it will stand our winters better than clover, having had a small patch of it, which has stood four winters without the slightest injury." The Domestic Encyclopedia says "Lucerne thrives best in deep, rich, pliable loams, whether they abound in sand or gravel; as well as in good dry soils, and in the coldest climate." It appears to be a given point among agricultural writers, that Lucerne will grow well in the coldest climates; but those which are milder are most suitable for it. This might be pre-supposed from the circumstance of its being a native of the south of Europe. Lucerne is a deep rooting plant, and of course will not only withstand drought but frost better than if it had but a superficial hold of the soil.

PHILADELPHIA SOCIETY FOR PROMOTING AGRICULTURE.

ANNUAL MEETING, JANUARY 15, 1828.—The Mease Vice President, in the Chair. The following officers were elected.

President—Richard Peters.

Vice Presidents—James Mease, Nicholas Bidd, Isaac C. Jones, Wm. Phillips.

Secretary and Librarian—W. S. Warder.

Treasurer—W. M. Walmisley.

Corresponding Committee—Richard Peters, Jas. Mease, Z. Collins, John Vaughan, Wm. Phillips.

Clerks—Robert Hames, Roberts Vaux, Stephen Duncan, Jeremiah Warder, John H. Fowler.

The following communications and donations were received:

1. From Signor Barbieri, curator of the Botanic Garden of Mantua, Italy, an account of the *Hibiscus roseus Thunb.*, a plant which grows abundantly in the marshes of Italy, and reaches to the height of from 7 to 12 feet. It is perennial, produces many stems from each root, and beautiful blossoms from 18 to 22 inches in circumference. It is applicable to all the uses of hemp and flax.—A specimen of cord and paper made from it, accompanied by a quantity of the seeds of the plant, were sent by Mr Barbieri. The seeds germinate easily, and the plants may be multiplied by dividing the roots. The thready fibres of the stalk, it is said, separate readily by maceration in water, or by being passed through channeled rollers.—The common brake would, doubtless, answer this object. The stalks cut when in blossom, produce fibres almost as fine as silk, and very strong. As this plant requires neither the annual sowing, nor the same degree of attention, or expense for manure, as hemp or flax, it may lay claim to some exclusive advantages over these vegetables. Experiments can alone determine their comparative merits.

There are ten native and three foreign species of the genus *hibiscus* in the United States; the *h. roseus* is not among either; but it appears from the communication of Signor Barbieri, that it is a variety of the *h. palustris* which grows abundantly in the lower parts of New Jersey, the farmers of which State have long since found it, when macerated and prepared, a good and cheap sub-

strate for hemp, for cord, plough lines, &c. The *hibiscus* has, from remote time, been known in Italy. The classical student will at once call to mind the two places in which it is mentioned by the agricultural poet of Mantua.

“Hibiscum propter viridi compeller hibiscus.”

And— Eclogue 2.

“Dum sedet, et gressu facillam trahit hibiscus.” Eclogue 10.

It is highly probable that the plant alluded to was the *hibiscus roseus*. The ancients, we see, used it as a rod, and to make baskets: its application to the purposes of hemp and flax is a recent discovery, for which Italy is indebted to Signor Barbieri. Our countrymen have, however, anticipated him in the knowledge of the utility of one of the family, as a substitute for some of the objects to which these vegetables are applied—Whether the native plant possesses the fine fibre of its Italian relation, a fact upon which Signor Barbieri dwells, remains to be ascertained.

Some of the seeds were distributed to the members of the Society; the remainder shall be given to any one disposed to make a trial of them, and who will promise to report the result of his experiments with them. The society have to regret the neglect in this respect of most persons to whom foreign seeds on which they set a value, have been annually given for a series of years, and of their forgetfulness to comply with their promises to send in return a few seeds of the various plants and trees of the United States, which were particularly asked for by the superintendent of the Garden of Plants in Paris, to whose polite and kind attention the society are regularly indebted every season for a box of seeds, the growth of that magnificent establishment. The seeds, nuts and acorns, of our gardens, swamp and field plants, and forests, will all be acceptable, and will find places in the great repository just mentioned,—one of the chief sources of gratification and delight to every traveller of taste and lover of rural nature who visits the French capital.

II. The Committee of the Society charged with the management of the fund left by the late John Scott, of Edinburgh, to the Corporation of Philadelphia, to reward those “who make useful inventions,” reported, that during the past year they had awarded four premiums, viz:—

1. To Joel Taylor, of Danbury, Connecticut, for an improvement in dyeing kettles for hatters.—*A medal and twenty dollars.*

2. To James Cooper and Thomas Baruit, of Philadelphia, for an apparatus to finish hats which greatly diminishes the labor of the operation, without injury to the hat.—*A medal and twenty dollars.*

3. To Daniel Powles, of Baltimore, for a bedstead which can be put up and taken down by any person, owing to the peculiar construction of the joints: it is also proof against insects, from the closeness with which they fit, and the rotary motion of the pins upon which the cords of the sacking are fastened.

All the foregoing are in use in Philadelphia, and highly approved of.

To the same, for a stirrup intended to secure the immediate disengagement of the foot in the event of a person being thrown from a horse.—*A medal and twenty dollars.*

4. To Messrs. Terhven, brothers, of Philadelphia county, for a machine to wind off the silk from the cocoons, and to twist and double the

thread at the same time.—*A medal and twenty dollars.*

III. Mr N. Patullo, merchant, of Philadelphia, presented a bottle of the seed of the very high flavored tobacco from Cuba, known by the name *Buella Abazo*, and from which the first quality of cigars are made in the island. This seed was part of a parcel imported by the donor, for the express purpose of distribution in the United States. The Society, duly sensible of the patriotic conduct of Mr P., resolved to present their thanks to him for this disinterested and praiseworthy attempt to improve one of the staple productions of the United States,—an example worthy of being followed by our native citizens who trade to or visit foreign countries. The donor may rely upon the best measures being taken with the seed, in order to fulfil his intentions.

IV. Mr J. C. Loudon of London, presented the 10th number of his Gardener's Magazine, viz. for November last. The preceding nine numbers had been already received. This truly excellent work is warmly recommended to every one who wishes to improve his grounds, or the quality of the excellent or ornamental productions of his garden—The Editor is a practical man, and well known as the author of two works on laying out country seats and grounds, and of the Encyclopedia of Gardening, and of Agriculture.

The Horticultural Society of Paris, sent the first number of their transactions.

PENNSYLVANIA AGRICULTURAL SOCIETY.

A quarterly meeting was held at the Indian Queen in Fourth street, on Saturday, January 12, the President being in the Chair.

A communication from Anthony Morris, Esq. of Washington, was read, recommending the establishment in Pennsylvania of an Agricultural Seminary, on the plan of Mr Fellenborg, of Switzerland.

On motion of Col. Watnough.

Resolved. That the Society approve of the general feature of Mr Morris' project, that the communication be entered on the minutes, and published in all the papers of the State favorable to the plan.

The Society proceeded to the election of officers for the present year, when the following gentlemen were duly chosen.

President—Jonathan Roberts.

Vice Presidents.

William Harris,	James Worth,
Stephen Duncan,	Manuel Eyre,
Thomas Scerril,	

Corresponding Secretary—John Hare Powell.

Treasurer—George Blight.

Directors.

Reuben Haines,	Thomas Smith,
Henry L. Waddell,	Matthew Roberts,
John C. Watnough,	George Sheaff,
Richard B. Jones,	Charles Miner,
Jonathan Thomas,	Thomas Penn Gaskell,
Loyd Jones,	George W. Sergeant,
William Parlington,	Callender Irvine,
Samuel Davis,	Joshua Evans,
James Cox,	George W. Holstein,
Anthony Taylor,	Algerman S. Logan.

Recording Secretary—John P. Milnor.

Assistant Recording Secretaries.

Charles L. Davis,	Adam Siter.
-------------------	-------------

Lieut. Uriah P. Levy, of the United States Navy, presented the Society with a parcel of wheat, beans, melon and pumpkin seeds, brought by him from Paraguay, which were taken by the Recording Secretary for distribution

From the Minutes.
JOHN P. MILNOR, Recording Secretary.

FRUIT TREES.

Limn-an-Banone Garden, }
Jan. 24th, 1828.

Dear Sir,—I send you herewith some further extracts of my Treatise, (now in press) which you can publish as “Extracts from Prince on Horticulture. Yours most respectfully,

W. M. PRINCE.

GERMAN MEDLAR.

This tree, the peculiar flavor of whose fruit, when wholly matured, has many admirers, will flourish in any soil but one that is wet and marshy, and in any exposition whatever: it exacts no particular care in its culture. The principal varieties are the common Dutch or German, the Royal Dutch, the Nottingham, and the Seedless. The fruit is of a brownish colour and hasn't flavor before it is ripe, but if collected the beginning of October, and placed on shelves, it changes to redish, and the pulp becomes softened and acquires a sweetish taste, which is pleasing to many persons, but not admired by every one.

DATE PLUM, OR PERSIMMON.

The European Date Plum, or Diospyros Lotus, called also the European Persimmon, will thrive in almost any soil or situation. It is of indifferent quality, and inferior to the American, and like the latter, needs the aid of frost before it becomes mellow for eating. The American Persimmon is so universally known it needs no description. The Diospyros Kaki, or Japan Date Plum, is said to produce fruit of a cherry colour, and fine flavor—it supports, without protection, the winters of Long-Island.

FILBERTS.

This shrub, or, in some cases, tree, accommodates itself to every exposition, and to every variety of soil, but prefers a moist loam on a sandy bottom, with a northern exposition. It is easily multiplied by seeds, layers, or inoculation. In fact, these nuts, which are vended in large quantities in our markets, grow as well in our climate as the common hazel-nut, and produce very abundantly. Such being the case, it is hoped, ere long, sufficient will be produced from our own soil to supersede the necessity of importation, as plantations of this tree would amply remunerate the possessor, or, if planted as a hedge, would be found to be very productive. A single bush of the Spanish filbert in my garden has produced a half bushel annually.

The varieties most valued are the English White Skin, and Red Skin, the Spanish, and the Cobnut; these two last with very large fruit; also the Prolific, the Frizzled, and the Colurna or Constantinople. Of American hazelnuts, which partake of the same properties, but have much smaller fruit, there are two species, the Common Hazelnut, and the Cuckoldnut. None of the above need much attention, except occasionally to thin out the older branches, and to keep them free from suckers near the root.

FIGS.

This tree delights in rich, sandy and gravelly soils, but no tree will accommodate itself to a greater diversity of soil. It, however, the ground selected is too moist, the fruit is less flavored. It requires a warm exposition, for it has been noticed, that the more it received the operation of the sun's rays, the more sugary and high flavored have been its fruit. It is easily increased by cuttings, layers, and suckers. The fig trees should, however, be kept free from suckers, as these draw off the nourishment in a great degree from the main tree, thereby causing the fruit to be very small, and often immature; but in northern localities it is necessary to form them into low shrubs, that they may be less exposed in winter, and the more easily protected from cold if necessary.

In the middle and northern states, where the fig trees are killed nearly to the ground by the severity of the winters, two crops of fruit may be obtained each season, by planting the early kinds in a warm or sheltered situation, if pains are taken in autumn to bend the trees down, and cover them with earth, sloping the embankment so as to cast of the rain; but, early in April, they should be uncovered and set upright. By this treatment they will produce one crop of fruit early in the summer, and another in September or October.

There are some varieties which are more hardy, and ripen their fruit more regularly in cold situations, than others—such as the Early Brown, Large Late Brown, Large White Genoa, Long fruited or Printanera, and some others. Among those of the finest quality, and which are held in the highest esteem in the South of France and Italy, are the Versailles, Servantine, Napolitaine, Poulette, Large Green, Violet, Marseilles Yellow, Bourjassette Blanche, &c.

GOOSEBERRIES.

These may be propagated from layers or cuttings; if in the latter way, it is customary to cut out the eye at each joint of those that go below the surface of the ground, except the two lower ones, which prevents a superabundance of suckers from afterwards being thrown up by the roots; and, in transplanting the young layers, it is best to pursue a similar course.

The gooseberry flourishes most in situations where it cannot feel the effects of our intense noontday sun, and it will withstand an exposure to cold far better than to one of heat. It seems to have reached the acme of its excellence in Lancashire, in England, and in Scotland, where the air is rarefied by the breezes of the ocean, and where the atmosphere may be considered as possessing a considerable degree of humidity. The climate of Rhode-Island I have noticed as being particularly favorable to it, which may be accounted for by the strong approximation it bears in climate to the countries before mentioned. In all cases, the gooseberry should be kept free from suckers, and trained near the ground to a single stem, this mode of training them being found to cause a far greater product in quantity, as well as an increase in the size. They need much attention in other respects, and one-third of the old wood must be regularly trimmed out every autumn, by which means a succession of thrifty bearing wood will be kept up; as the finest fruit is produced on the young shoots of the previous year's growth, it is also necessary every autumn

to dig in a plenty of old well rotted manure around them. This treatment will cause them to grow strong, and the fruit to be large and fair. Where the summers are very hot, a northern aspect is preferable, and the fruit will be twice the size, if they are planted against a north fence, or in any other situation where they are sheltered from the intense heat of noon-day, which, when differently situated, often scorches the fruit to such a degree as to entirely stop its growth.

From the Old Hampshire Post.

PROFESSOR HITCHCOCK'S ADDRESS.

We have read with great satisfaction the Address delivered by Prof. E. Hitchcock, before the H. P. and H. Agricultural Society, which has issued from the press of the Messrs. Adams, of Amherst. It is written in a plain, perspicuous style, and well sustains the scientific reputation of its author. The tendency of the address is to show the dignity of agriculture; that the business of the farmer is not a mere routine of manual operations; but that his pursuits admit and require high intellectual cultivation, and extensive acquaintance with science. The connection between Agriculture and other departments of knowledge is pointed out, and illustrated particularly in Chemistry, Botany and Geology. Much interesting and valuable information is communicated respecting the formation and varieties of soil in the valley of the Connecticut, and the mineral treasures already known, or which may be expected to be hereafter discovered in that region. The address was heard with an interest which is not diminished in the perusal. We copy the concluding paragraph, which is a favorable specimen of its style, and tone of sentiment. We believe there are few persons, engaged in the more bustling scenes of life, to whom the hope of one day retiring to the calmness and independence of agricultural pursuits does not form a considerable item in their account of enjoyment. There are many, we know there are some, in whose minds this part of the address will awaken trains of long cherished and happy associations.

"Earthly happiness is not a phantom; it has a positive existence, confused and disordered as the world is. And we all of us taste more or less of this happiness, as we are hurried along through life. True, it is not heavenly happiness in its kind; nor is it unmixed. The fountain has been poisoned and the streams flow out contaminated.—Still we all thirst for the waters, and earnestly seek that region where they flow most pure and abundant. The ambitious monarch believes he shall find them by desolating the earth; and that every cup of happiness he dashes from the lips of others, will be poured into his own. But he finds that he has mistaken a sea of blood for a sea of happiness. The youthful Statesman, as he rises from one station to another in the councils of his country, but faintly realises how far away from the regions of happiness, the surges and the storms of public life are driving him. The man who strives for pre-eminence in a learned profession, knows not, till the desired elevation has been reached, how high it stands above, not merely the follies, but the enjoyments of life. And so in many other pursuits; when the charm of novelty has passed away, when time has cooled the passions, and possession has disrobed the object of its false splendor, then it is found that the streams

of happiness, like the streams of the desert, are almost dried up; leaving only their empty channels to mock desire. It is then that men begin to sigh for pursuits more calm, and peaceful, and retired. Hence it is, that so many, from the highest stations in life, have spent the evening of their days in the pursuits of agriculture; in the prosecution of experiments for increasing the produce of the soil. Here they found that contentment and satisfaction, which in vain they had sought in the possession of power, and wealth, and reputation, and learning. For when all artificial pleasures have become insipid and even disgusting, rural scenes and pursuits have still the power to make new chords of happiness vibrate in the soul. We need not wonder then, that so many, after faithfully serving their God and generation, till exhausted nature demanded repose, have sought these scenes as a resting place from their toils;—have landed on this peaceful shore, from the tempestuous voyage of public life. Says Washington, "I was summoned by my country, whose voice I can never hear but with veneration and love, from a retreat, which I had chosen with the fondest predilection, and in my flattering hopes, as the asylum of my declining years."

It is not therefore a mere poetic dream, that invests agricultural scenes and pursuits with a peculiar charm. Imagination may here resign her pencil into the hands of experience, nor fear that the picture will want in vividness and interest."

A growing place.—A correspondent informs us that Major Nathaniel Smith, of Patchogue, raised the last season, on one acre of ground, one hundred and three bushels of shelled corn. And on the same ground the year before, eighty-six bushels. We saw this corn the last year, and observed it was planted in drills.

Mr. Justus Rowe, of the same place, killed seven hogs last December, the weight of which was 630, 522, 313, 360, 341, 327, and 316. The first was two and a half years old; she had her first litter of pigs in January 1820, eight of which Mr. Rowe killed the same year, when about eleven months old, the aggregate of which was 2400 lbs. In June of the same year, she had another litter; only one of which he kept—and is the one which weighed five hundred and twenty-two when killed. She had a litter last June, which were sold as sucklings for eighteen dollars; and in January had another litter; five of which when killed (being the five last in the above list) the aggregate weight of which is 16,530 pounds. In September last she had another litter of six, which Mr. Rowe now has, and are estimated to weigh, on foot, one hundred pounds each. The pork which this hog with that of her offspring has furnished Mr. Rowe and his neighbors, amounts to between eleven and twelve thousand pounds.—*Sag Harbor Corrector.*

MAXIMS.

Consider the end before you begin, and before you advance provide a retreat.

Give not unnecessary pain to any man, but study the happiness of all.

Grieve not for that which is broken, stolen, burnt or lost.

Never give orders in another man's house, accustom yourself to eat your bread at your own table.

Take not a wife from a bad family, and seat not thyself with those who have no shame.

REPORT OF THE NEW YORK HORTICULTURAL SOCIETY.

The Society feel it incumbent on them to lay before the public, the following sketch of their doings during the past year, and offer the following extract from the annual report of the inspecting Committee.

The Inspecting Committee of the New York Horticultural Society, report that their weekly meetings during the past year, have generally been well attended, and the articles offered for competition, have been abundant and of good quality. Our collections of ornamental plants and esculent vegetables, have been considerably increased by very liberal contributions from Drs. Hosack and Mitchell, obtained by them from their foreign correspondents, and generously presented to the members of the Society. Several other gentlemen in this city and in other countries, have likewise contributed considerably to the augmentation of our vegetable productions, two of which we think deserving of particular notice in the present report. The first is that of the original Potato, the *Solanum Tuberosum*, obtained from its native soil and country, in South America, and sent here by Surgeon Tinsler, of the United States Navy, to Dr Mitchell, who presented them to the Society for cultivation. They were planted, and grew with the same facility and vigor, in stem and blossom, as those which have been so long acclimated to our northern hemisphere: and in no particular, did the foliage or habit appear to differ, but from the rambling fibrous roots which were produced in great abundance. Not the least symptom of the formation of the smallest Tuber, ever made its appearance, although they were planted in the ground, and continued a sufficient length of time in blossom, before the frost set in, to have produced and matured an abundant crop. A very striking evidence this, of the great effect which soil and climate have upon the produce of particular plants, and a most powerful inducement to encourage our perseverance in endeavoring to improve the produce and qualities of every thing that comes under care; for when we see the vast improvement which a continuation of careful cultivation has effected upon this now most valuable vegetable, we can scarcely conceive to what a superior degree of perfection, a proper mode of culture might yet bring many or perhaps all our other vegetable productions. We do not expect that any improvement in the culture of the potato, will ever render it capable of producing an entire substitute for bread; but if succeeding generations can support its improvement in any thing like a ratio, to that which it certainly has undergone for one or two years past, and the quality of wheat remain nearly stationary, it appears difficult to determine at present, which of the two, might then be found the most valuable article of food.— The other vegetable which we have to notice particularly, is called New-Zealand Spinage, *Tetragona expansa*, the seeds received by Dr Hosack, from Paris, and presented by him to the Society, last Spring; they were planted by Mr Floy, and succeeded remarkably well. It is very productive, and continues fit for table throughout the summer season, is very wholesome and palatable, and may justly be considered as one of the most important additions to our vegetable collections that has been obtained for many years past. Several new varieties of Tobacco, and some of them of very superior quality, have been received and

cultivated for the Society, by Dr Buxton, whose ingenious attention to the cultivation of this particular plant, entitles him to great credit.

The members of the Inspecting Committee, have also great pleasure in being enabled to state that they have observed an increased degree of emulation and industry generally excited in the vicinity of this city, in horticultural pursuits.— At one establishment in particular, they were so much pleased with the excellent arrangements for horticultural improvements, as well as for promoting the health and vigor of its youthful and ambitious competitors, that they cannot let the present opportunity pass, without expressing their highest approbation of that valuable institution, the Lyceum of the late Mr. Baneel, at Bloomingdale, whose grounds every where exhibited the evidences of an enterprising, well regulated improvement, and those departments which were appropriated to the raising of vegetables and small fruits, highly bespoke the care and skill of an able horticulturist. But what attracted our attention above all, was a most beautiful group of miniature gardens, all contiguous to each other yet distinctly separated by low lines of pigny fences; and in which every student had his particular *parterre*; in some instances, two or more were associated in the cultivation of one spot, and in order to encourage the industry and improve the skill of their youthful cultivation, a premium was given by Mr Baneel, to the cultivators of that spot, which competent and disinterested judges pronounced to excel all the rest. Perhaps no appendage to a literary institution could be attended with finer or more beautiful effects than this.— The subsoil, if it may be called so, of the whole group, seemed to have been but lately a bare rock; but such had been the ambition and industry of the little gardeners, that from the adjacent valley, ample depths of good earth had been introduced, and an extensive variety of the most beautiful flowers, shrubs, &c. flourished in gay assemblage throughout the whole. And while your committee lament the late event which has interrupted the progress of this institution, and deprived our society of a most valuable member, they hope still to see many Mr Baneels actively yielding or directing the spade, the hoe, and the rake.

The following is a list of those members of this Society, who are entitled to premiums for articles exhibited this season, 1827.

VEGETABLES.

Dr Hosack,	Best early Cucumbers.
William Fairbairn,	" Cauliflowers.
Alexander Smith,	" early Peas.
William Curr,	" Lettuce.
Charles Oakley,	" early Lima Beans.
Michael Floy,	" Knight's Marrow Peas.
John Roberts,	" Celery.
Alexander Smith,	" Sea Kail.
Israel Dean,	" early Cabbage.
William Wilson,	" Melons.
William Fairbairn,	" Blood Beets.
George Still,	" Endive.
Michael Floy,	" Savoy Cabbage.
George Still,	" Carrots.
William Wilson,	" Brocoli.
James Adams,	Fine sample of Peas.
Engle Fick,	" Drumhead Cabbage.

FRUIT.

Alexander Smith,	Best Cherries.
Francis Cooper,	" Strawberries.

William Neale,	best 1000 berries.
Alexander Smith,	" Apricots.
Charles Oakley,	" Peaches.
Alexander Smith,	" Pears.
Peter Aymar,	" Plums.
Peter L. Vandervoort,	" Nectarines.
Alexander Smith,	" Grapes.

FLOWERS.

William Wilson,	Best Polyanthus.
Thomas Hogg,	" Auriculas.
G. Thorburn & Son,	" Hyacinths.
Thomas Kinnersly,	" Tulips.
William Large,	" Pinks.
William Phelan,	" Carnations.

To Messrs. A. Parmentier, Thomas Kinnersly, William Phelan, Daniel Kenney, William Wilson, Michael Floy, Alexander Smith, Thomas Hogg, William Large, Dennis H. Doyle, Robert Dyson, William Bisbee, Noah Wetmore, Superintendent of the New York Hospital, and some other members, the Society is also much indebted for their exhibitions of a great variety of flowers, fruit and vegetables. The Society is much indebted to Com. Isaac Hull, for valuable varieties of Beans, &c. presented on his return last spring, from the Pacific Ocean; and to Mr Isaac Denniston of Albany, and Mr Richards of Newark, for the choice collection and very liberal supply of Plums and Green Gages, presented at their late anniversary dinner. It is also worthy of remark, that melon seeds, 26 years old, presented to the Society by Mr Hoffman, and received by him from the late Mr Seton, were planted and bore fruit: some of which so raised were presented to the Society, by Mr Peter A. mar.

The Society offer premiums for the following articles, for the year 1828:

FLOWERS.

Polyanthus, Auriculas, Carnations, Pinks, Tulips, Hyacinths. The days of exhibition to be fixed by the Inspecting Committee.

VEGETABLES.

Cucumbers,	Best pair, earliest forced.
Peas,	" 1 quart, last Tuesday in May.
Cabbage,	" 4 heads, do do
Potatoes,	" half peck, do do
Beets,	" 6 roots, second Tuesday in June.
Carrots,	" 6 roots do do
Celery,	" 6 plants, last Tuesday in July.
Lima Beans, (earliest.)	" 2 quarts in pods.
Lettuce,	" 4 heads, the season.
Cauliflowers,	" 2 heads, do.
Knight's Marrow Peas,	" half peck, do.
Cape Brocoli,	" 4 heads, do.
Savoys,	" 4 heads, do.
Endive,	" 4 heads, do.
Beets, (late)	" 6 roots.
Carrots, (late)	" 6 roots.
Sea Kail,	" "

FRUIT.

Peaches,	Best dozen.
Plums,	do. do.
Pears,	do. do.
Nectarines,	do. half dozen.
Apricots,	do. dozen.
Grapes,	do. 2 bunches.
Strawberries,	do. quart.

Muskmelons, do. dozen.
Gooseberries, do. dozen.

The day for exhibition, to be fixed by the Inspecting Committee, and published.

Discretionary premiums will be awarded for flowers, vegetables, or fruit, presented by members, or others, when rare and of excellent sorts.

Doct. Gnetano Lanuza, at the anniversary dinner, proffered through his friend Doct. Pascalis, to the society, a premium, in value the sum of \$50, for the best fruit or vegetable production, that may be designated by the Society, and produced at the next anniversary. Notice will be given to the members of what the same shall consist.

By order of the Society,
W. M. BURSELL, Recording Secretary.
York, December 25th, 1827.

REMARKS ON GRASSES.

[Continued from page 212.]

When land is to be sown for permanent pasture, no admixture of any annual or grain crop, or broad-leaved clover, should be admitted with the grass seeds. Experience proves that they are highly injurious to the intention of speedily forming a solid productive sward; and the profit that may accrue from a grain crop thus obtained, will be much overbalanced by the loss of grass in the two following seasons. Every plant of these annual crops occupies a place, to the detriment of the expected sward; besides rendering the surface porous by the decay of their roots, in the end of autumn—much mischief, likewise, is done to the sward by portions of the crops being beat down with heavy rains. The above mixture should be sown in the autumn or spring, at the rate of four bushels and a half to the acre; much less will form a good pasture, but when the seeds can be had from the farm at a moderate expense, the maximum quantity should be adopted. If sown in spring, it will be found highly useful, in the following autumn, to give the surface a slight top-dressing with rotten dung or compost, in which the seeds or roots of weeds are not suspected, and to sow immediately after a half a bushel, more or less, of the mixture of seeds, according as the sward appears to be deficient of plants; after which, (the top-dressing being previously well reduced by a slight bush-harrow,) the roller should be liberally used; and rolling, for the first two years, should never be neglected at any favorable opportunity. If the seeds are sown in autumn, the top-dressing, re-sowing, and rolling, will be found equally requisite and beneficial in the following month of May; and even if repeated in the following autumn, they will greatly forward the intention. This is imitating the process of nature in forming pastures—with this advantage, that for one seed of a valuable species of grass supplied to the soil by the slow and gradual process of nature, in one season, a thousand are supplied in the same space of time; and thus take possession of their natural soil,—without the danger and inconvenience of expelling its usurpers.

There has been some difference of opinion respecting the manner of reaping the produce of seedling grasses; whether by depasturing with sheep, or by mowing after the plants have perfected their seed. The manure supplied by sheep to the young grasses is of great advantage; but the animals are apt to bite too close to the root, and sometimes tear up the young plants altogether. It has found, on repeated trials, that cropping

seedling grasses before they had produced flowers, had the effect of retarding and weakening the after-growth of the plants for that season very much. But after the period of flowering, cropping was found to strengthen, and rather encourage the growth of plants. In the same way I found, that old plants of grass, when cut very close after the first shoots of the spring made their appearance, afforded about one third less weight of produce in the whole season than those plants of the same species which were left uncut till the flowering culms began to appear. As the advantages of the manure of the sheep may be supplied by top-dressing, and the disadvantages resulting to the tender seedling plants from early and close cropping cannot so speedily be removed, the practice of suffering the grasses to produce flowers before they are cut, with the application of top-dressings, and the use of the roller, till the spring of the second year, appears to be far more profitable than the former practice of depasturing the seedling grasses at an earlier period than the spring of the second year. But in this, no doubt, as well as in other particular modes of management recommended for general practice in the culture of plants, local circumstances may interfere so much as often to render some modification thereof necessary.

The superior value of sainfoin for soils on a porous or dry sub-soil is therefore manifest.

Sainfoin grows wild in all the chalky districts in England; but it was first introduced to English farmers as a plant for cultivation from Flanders and France, where it has been long cultivated. Parkinson, in the year 1640, says, that "it is generally known to be a singular food for cattle causing them to give store of milk." Worlidge in his *Mystery of Husbandry*, &c. (1681), treats of sainfoin at large; "in Wiltshire, in several places," says he, "there are precedents of sainfoin that has been there twenty years growing on poor land, and has so far improved the same, that from a noble per acre, twenty acres together have been certainly worth thirty shilling per acre, and yet continues in good proof." These extracts show the high opinion which was entertained of this plant above one hundred years ago; but this was, no doubt, in a great measure owing to the small number of plants then known for sowing in the farm.

The experiments that have here been made on this plant were confined to a clayey loam and a light siliceous soil. Upon these it was evidently inferior to the broad-leaved and perennial red clover; but on chalky and gravelly soils there have been abundant proofs of the superior value of sainfoin. After the ample details of the uses and cultivation of sainfoin, given in Mr. Young's *Annals*, it will be difficult to add any thing new. It is a perennial plant, and produces but little herbage the first year, and on that account should not be sown on land that is intended to remain only two years under grass. In Mr. Young's *Annals*, we are informed, that sainfoin is allowed on all hands to be an admirable improvement on lime-stone rocks and chalk downs, which in order to be cultivated to the greatest advantage, should be in this course, with no more arable than is necessary for the change. Thus, if sainfoin last sixteen years, as it certainly will if properly managed, then sixteen parts of the down should be sainfoin, and as many more parts as there are years necessary for tillage, before the ground should be sow-

ed with it again; suppose this period to be five years, the portions would be 16 sainfoin—1 sainfoin pared and burnt, and under turnips—1 barley or oats—1 clover—1 wheat—1 turnips—1 barley or oats, and with this crop sainfoin sown again=22. In another part we are informed that sainfoin is also a great improvement in thin, loose, dry, stony loams, upon marl or chalk bottoms.

Thin soils that wear out, or tire of clover, are laid down to great advantage with it, will last twenty years, and pay the farmer as well as his best corn crops. If a flock of sheep be an object of primary importance, this plant will afford them plenty of dry food for winter, in hard weather.—An acre of indifferent land will yield two tons of sainfoin, dry, and therefore twenty acres will serve 1000 sheep for a month, supposing a sheep eats three pounds of hay in a day, which is a large allowance.

It flowers about the middle and towards the end of June. The seeds are large, and when sown in wet soils generally burst and rot without vegetating. There is some difference of opinion with respect to the best season for sowing; according to several trials that I have made, the middle or end of April is the most certain; but when sown in the autumn, unless the soil be favorable, many of the plants are lost during the winter: should circumstances prove otherwise, the autumn sowing will be found the most advantageous, as it affords nearly a full crop in the ensuing season.

The grasses, and other plants, best fitted for alternation, as green crops with grain, are such as arrive at perfection in the shortest space of time, or within the compass of two years; such as have their leaves broad and succulent, and that do not quickly run to seed. Plants of this description are supposed to produce the greatest weight of herbage at the least expense to the soil.

It is a curious and well known fact, that any species of plant that has continued till its natural decay on a particular soil, cannot be again immediately reared with equal success on the same spot, till some other crop intervene; but that a different species of vegetable will there succeed better, for its peculiar period of life, than it would on a soil naturally better adapted to its growth, where it had just attained to perfect maturity.—This holds good with respect to annual plants as well as to those that continue to live many years. But it is better seen in the former, as their habits and duration in the soil are oftener and more directly within the reach of common observation.

On this antipathy of plants seems to depend the theory of alternate cropping with green crops and grain—varying in some measure according to the circumstances of soil and climate; but the principle appears to remain the same.

On analysing a soil immediately before and after producing an impoverishing crop, the results of such analysis do not point out any diminution in the weight or proportions of its constituents sufficient to account for the weight of vegetable matter produced. The decomposing animal and vegetable matters of the soil are the only constituents wherein a sensible loss is perceived.

M. Braconnot grew plants in substances free from any kind of soil, as in flowers of sulphur, and in metal. He supplied the plants with distilled water only. They arrived, by these means, to a perfect state of maturity. The produce was submitted to careful analysis; and the results showed that the different vegetables so produced,

contained in the constituents of the different species, precisely the same as when the plants were cultivated on their natural soils.

Mangel wurt, or white beet, (*Beta cicla*) produces upon a suitable soil, or a deep rich loam, on an average, twenty-five tons* of green food per acre—every pound weight of which contains 330 grains of nutritive matter; and, therefore, per acre

Green food.	Nutritive matter.
lbs.	lbs.
56000	3120

Carrots, (*Daucus carota*) produce upon a deep light loam, on an average, eleven tons, every pound of which contains 160 grains of nutritive matter

24640	2640
-------	------

Potatoes, (*Solanum tuberosum*), produce upon a fresh loam, of intermediate quality as to moisture and dryness, on an average, 15 tons per acre, affording of nutritive matter per pound, 1600 grains

33600	4800
-------	------

The common leaf, or white turnip, (*Brassica rapa* var.) affords from a sandy loam, upon an average, per acre, sixteen tons of green food, a pound of which contains 323 grains of nutritive matter

35400	1632
-------	------

The Swedish turnip, or ruta baga (*Brassica rapa* var.) produces on a favorable soil, or a strong loam, on an average, 13 tons per acre, a pound weight of which affords of nutritive matter 440 grains

29120	1830
-------	------

Cabbages, (*Brassica variegata* var.) which delight in a rich strong loam, afford of green food, on an average per acre, 25 tons, every pound of which contains 450 grains of nutritive matter

56000	3440
-------	------

Round turn, (*Brassica elongata* var.) the produce from a soil similar to that for cabbages or Swedish turnips, is on an average, 14 tons per acre, and affords of nutritive matter per pound 323 grains

31200	1851
-------	------

If a plant, therefore, impoverish the soil in proportion to the weight of vegetable substance it produces on a given space of ground, the following will be the order in which the plants just mentioned exhaust the land.

Mangel wurt, or, 25	The proportions which they bear to each other with respect to weight of produce.
Cabbages, 35	
White Turnip, 16	
Potatoes, 15	
Koif root, 11	
Swedish Turnip, 11	
Carrots, 14	

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 1, 1852

ON REARING AND MANAGING GEESSE.

Breeding. Geese, in general, breed only once a year; but, sometimes twice, it will keep. Three of these birds, it is said, should be allotted to one gander, for if the number were increased, the eggs

* I have found this variety less nutritious and less hardy than the pink or light red mangel wurt. Sixty-eight thousand four hundred and forty-eight pounds of the pink kind were produced, in 1823, upon one acre and fourteen perches of farm land in Philadelphia county.—*Am. F.*

will usually be rendered abortive. Other say one gander to five geese. The nest should be prepared as soon as the female begins to carry straw in her bill. The number of eggs to each goose for sitting, should be about twelve or thirteen. White sitting, say some writers, the goose should be fed with corn and water, which must be placed near her. Louden, however, says, "feeding upon the nest is seldom required." The gander should, at this time have free access to guard her. The nests in which these birds sit, ought to be made of straw, and so constructed that the eggs will not roll out, as the sitting goose turns her eggs every day during the period of incubation, which is said to be from twenty-seven to thirty days. Willich's encyclopedia says, that, "when the eggs are nearly hatched, it will be requisite to break slightly the shell near the beak of the young goslin, as well for the purpose of admitting air, as to enable it to make its way at the proper time." We do not, however, find that any other author recommends this practice, and as wild geese can have no assistance of the kind, we conclude that goslings can, generally speaking, make their way into the world without the proposed manipulation.

Mr. Cobbett says, that, "geese can be kept to advantage only where there are green commons, and there they are easily kept—live to a very great age—and are among the hardiest animals in the world. If well kept, a goose will lay a hundred eggs in a year. The French put their eggs under large hens of common fowls, to each of which they give four or five eggs; or under turkeys, to which they give nine or ten goose-eggs."

Rearing. At first setting at liberty, the pasturage of the goose should be limited, otherwise, if allowed to range over an extensive common, the goslings will become cramped, and some of them will fall behind and be lost. Mowbray advises to destroy all the hemlock and night shade in their range. As the young become pretty well feathered, they become also too large to be brooded beneath the mother's wing, and as they will then sleep in groups by her side, they must be well supplied with straw, which they will convert into excellent manure. Being able, says Mowbray, to frequent the pond and range the common at large, the young geese will obtain their living, and few people, favorably situated, allow them any thing more, excepting the vegetable produce of the garden. But it has been his constant practice, always to dispense a moderate quantity of any solid corn or pulse at hand, to the flocks of store geese, both morning and evening on their going out, and their return, together in the evening more especially, with such greens as chance to be at command; cabbage mangel wurtzel leaves, lucerne, tares, and occasionally sliced carrots. By full keeping his geese, he ever in a fleshy state, and attained a large size; the young ones were also forward and valuable breeders in stock. Geese managed on the above mode, will be speedily fattened green; that is, at a month or six weeks old, or after the run of the corn stubbles. Two or three weeks after the latter, must be sufficient to make them thoroughly fat. A goose fattened entirely on the stubbles, is to be preferred to any other; since an over-fatted goose is too much in the oil-cake and grease-tub style, to admit even the ideas of delicacy, tender firmness, or true flavor. Louden. It is said, moreover, that geese may be fed to

advantage on turnips, cut in small pieces, similar to dice, but not so large, and put into a trough of water. Cobbett says, "when the young ones are hatched they should be kept in a warm place for about four days, and fed on barley meal, probably huan meal is as good mixed, if possible, with milk; and then they will begin to grow. Water for them, or for the old ones to swim in, is by no means necessary, nor, perhaps ever even useful.—Or, how is it, that you see such fine flocks of fine geese all over Long Island, (in America) where there is scarcely such a thing as a pond or a run of water?" Water for geese to swim in, however, is said by other writers, to be useful, if not indispensable to the welfare of geese, as it preserves them from vermin.

"Geese are raised by grazing, but to fat them, something more is required. Corn of some sort, or boiled Swedish turnips. Some corn, and some raw Swedish turnips, or carrots, or white cabbages, or lettuce, makes the best fattening. The modes that are resorted to by the French for fattening geese, nailing them down by their webs, and other sorts of cruelty, are, I hope, such as Englishmen will never think of. They will get fat enough without the use of any of those unfeeling means being employed. He who can deliberately inflict torture upon an animal in order to heighten the pleasure his palate is to receive in eating it, is an abuser of the authority which God has given him, and is indeed a tyrant in his heart. Who would think himself safe, at the mercy of such a man?"

Mr. Lawrence is of opinion, that "poultry is an article of luxury, for which the little farmer never obtains an adequate price. He had better allow his wife a certain sum for pin-money, than suffer her to keep these devourers." But, he continues, "an exception must be made in favor of geese, which will graze to advantage, and make much good manure; they are besides, useful in a farm-yard for giving alarm by sight." He recommends for feeding geese, chopped cabbage, lettuce, or carrots, and oats, particularly when they set.—"Not to be sent out to graze too early, and always fed before turning out, lest they wander beyond their strength, which is the occasion of many being lost every year. A goose fattens well on oats, in six weeks, littered down with clean straw: if from the stubbles in two or three weeks.

The Complete Farmer, an English work, says, "if you would fatten geese, you must shut them up, when they are about a month old, and they will be fat in about a month more. Be sure to let them have always by them in a small rack some fine hay, which will much hasten their fattening. But for fattening older geese it is commonly done when they are about six months old, or soon after harvest, when they have been in stubble fields, from which ood some kill them, which is a good way. But those who are desirous of having them very fat, shut them up for a fortnight or three weeks, and feed them with oats, split peas, barley meal, or ground malt mixed with milk. But the best thing to fatten them with, is malt, mixed with beer. You must, however, observe in fattening all sorts of water-fowl, that they usually sit with their bills upon their rumps, where they seek out the greater part of the moisture and fatness, at a small bunch of feathers, which you will find standing upright on their rumps, and always moist, with which they trim their feathers, which renders them more oily and slippery than the feathers of

other fowls, and causes the water to slip off them. If, therefore, the upright feathers are cut away close, they will become flat in less time and with less food than otherwise. If you give them rye before or about midsummer, it will strengthen them, and keep them in health, that being commonly their sickly time."

Plucking. A writer in the English Monthly Magazine, remarks on the cruelty of plucking the living goose, and proposes a remedy. He remarks on the additional torture experienced by the poor fowl from the too frequent unskillfulness and want of dexterity of the operator. "The skin and flesh are sometimes so torn as to occasion the death of the victim: and even when the fowls are plucked in the most careful manner, they lose their flesh and appetite; their eyes become dull, and they languish in a most pitiable state, during a longer or shorter period." The remedy proposed is as follows:—feathers are cut of a year's growth, and in the moulting season they spontaneously fall off, and are supplied by a fresh fleece. When, therefore, the geese are in full feather, let the plumage be removed, close to the skin, by sharp scissors. The produce would not be much reduced in quantity, while the quality would be greatly improved, and an indemnification be experienced in the un-injured health of the fowl, and the benefit obtained to the succeeding crop. Labor, also, would be saved in dressing, since the quilly portion of the feathers, when forcibly detached from the skin, is generally in such a state, as after all, to require the employment of scissors. After this operation shall have been performed, the down from the breast may be removed by the same means. The time has arrived, I trust, for successful exertions in the cause of compassion towards tortured and helpless animals; and I, presume, to make a serious call on the clergy and leading aristocracy of the districts implicated, for the exercise of their influence in this case, granting the reform to be practicable."

We have copied this article, for the consideration of those who are owners of this kind of poultry. We have, however, some doubts respecting the expediency of *clipping* geese. Perhaps the stumps of the feathers, cut off, would be in the way of the next growth of feathers, or might otherwise incommode the animals.

Willich's Domestic Encyclopedia, says, "geese are very valuable on account of the feathers they afford; for this purpose they are unmercifully plucked, in the county of Lincoln, Eng., (where they are reared in large numbers) *five times* in the year. The old birds submit quietly, but the young ones frequently prove unruly and noisy. The latter may be plucked once when about thirteen or fourteen weeks old, for feathers; but no quills must be taken from them; nor should this operation be performed at too early a season, because the goslings are liable to perish in cold summers. Although the plucking of geese is considered by many as a barbarous custom, yet experience has evinced, that these birds, when properly stripped of their feathers, thrive better, and are more healthy, than if they were permitted to drop them by moulting.

Quills. "The quills are termed first, seconds, and thirds, from the order in which they grow.—The two last kinds are those principally used in writing, on account of the larger size of their barrels. And as the utility and value of quills in the making of pens greatly depend on their firmness

and elasticity, different expedients have been contrived to harden them. The most simple of these, is to thrust the barrel into hot sand or ashes, for a few moments, afterwards to press them almost flat with a pen-knife, and then to restore their roundness by the fingers, with the assistance of a piece of leather or woollen cloth; removing at the same time their roughness by the friction. When, however, great numbers are to be prepared, other methods are adopted. Aqua fortis is frequently employed in the preparation of quills, by which they are stained a yellow color.

Feathers. "The best mode of preserving feathers, is to expose them in a room to the rays of the sun; and as soon as they are thoroughly dried, to put them loosely into bags in which they should be well beaten to cleanse them from dust and filth.

Choice of Geese. "In the choosing of geese for the table, care should be taken that the feet and legs be yellow, which is an indication of the bird being young; the legs of old geese are red. If recently killed, the legs will be pliable, but if stale they will generally be found dry and stiff."

A new breed of geese, called *Bremen Geese*, has been introduced into the United States, which is said to be decidely and considerably superior to any heretofore known in this country. They were first imported, we believe, by Mr. James Sisson, of Warren, (R. I.) who received a premium, in October, 1826, from the Rhode Island Society for the Encouragement of Domestic Industry, for the exhibition of some geese of this breed. They are said to possess the following advantages over any other animals of their kind:—They grow to a greater size, may be raised with more facility, are fattened with less grain, and make more delicious food. They may be purchased of Thomas Williams, Noble's Island, and Col. Jaques, Charlestown, Mass.

Improvement in making butter.—A subscription paper, (designed to raise a sum of money) to be placed in the hands of the Trustees of the Massachusetts Agricultural Society, for the special purpose of being offered by them in additional premiums, to persons who shall offer at the next Cattle Show at Brighton, considerable quantities of the best butter, has been deposited at several of the Insurance Offices. It is to be hoped it will meet with the necessary degree of attention and encouragement.

"The Charleston Courier of the 16th inst. says, "in consequence of our notice yesterday, of the extraordinary mildness of the season, a friend has presented us with a *ripe apple* and *strawberry*, of the second crop, which grow in a garden in this vicinity, and shewed as much freshness as is usual in mid summer. Accompanying the above, we also received an *ice-plant*; which, notwithstanding its name, we believe is one of the most tender plants known in our gardens. The Thermometer yesterday, stood at 75½ degrees, and the day is said to be the warmest known in January, for many years.

Within a few miles of Worcester may be seen, [conspicuously fixed in a plantation] the notice, that "Steel-traps and spring-guns are set in those grounds." To which is annexed, the following significant and kindly notice: "N. B. If a man is caught in this trap, it will break a horse's leg!"

Several Communications are received

SEEDS FOR EXTRA PROFITS.

Traders in the country, who may wish to buy an assortment of Garden Seeds for sale, may almost everywhere be supplied at the New England Farmer's office, No. 22 South Market street Boston with books containing a complete assortment of the seeds mostly used in a kitchen garden. It is favorable to us as they can be purchased in this country nearly double upon a small paper, at 6 and 12 cents each—arranged to be of the growth of 1827, and of the *prime* quality. **ONION SEEDS.** From 1 lb. SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SALLY CORNS, &c. of different sorts.

COOKS ON WHITE MUSTARD.

Just received and for sale at the office of the New England Farmer, "Observations on the Efficacy of White Mustard Seed, in affections of the Liver, Internal Organs, and Nervous System, and on the General Management of Health and Life. By Charles Turner Esq., Member of the Royal College of Surgeons, First American from the 3d English edition. Price 25 cts."

Whoever hopes for cures of special kind may suggest, of observing the proportion between nutriment and labor, and keeping the body in a healthy state by supplies exactly suited to its waste, we know that in effect, the vital powers, increased by action, grow gradually languid, that as their vigor fails, obstructions are generated, and from obstructions proceed most of those pains which wear us away slowly, by periodical tortures and which, although they sometimes suffer like in the long, seem almost to be useless, envious down to the couch of misery, and mock us with the hopes of death. —*Johnson.*

SHIELD ALMANACK.

Just published at the New England Farmer's office, a Sheet, 14 inch by 22 1/2.

MISCELLANIES.

The following *Song* was written by J. W. Whitman, Esq. of Boston, for the anniversary of Engine Company No. 7, in this city.

Oil in the stilly night
When Beauty's eye is sleeping,
The fire gods' bonfire light;
Then on its rest is creeping:
The smoke, the flash,
The ruin's crash,
The crumling timbers falling;
The love, the dear,
The starting tear,
Other betrothed one ceiling,
Chorus. Thus in the stilly night, &c.

See clings that daring youth
The habiter "beauty him barrow";
Ay, mark the lover's truth:
The maid with him returning:
Torn from the flame,
She lags his name,
Most dear when danger presses,
And watch his lip,
Sweet nectar sip,
From "beauty her unbound tresses,"
Chorus. Thus in, &c.

One instant, such as this,
Repays whole years of sorrow—
Perhaps such ripened bliss
May reach us ere to morrow.
Then pass the wine
To Beauty's share,
To courage and its daring—
Go seek its wreath
"Mid fire and death,
Its crown is worth one's wearing,"
Chorus. Thus in, &c.

When rings the midnight bell,
Disburdening Beauty's sigh-dreaming,
Remember then that spell
Once o'er thy brightly gleaming;
Your boy'd one's arms,
They veiled charms,
The hours which may come o'er thee—
Haste then away,
No longer stay,
Thy perfid' one's before thee,
Chorus. Thus in, &c.

Abstracts from *Silliman's Journal* for January 1893, by the Editor of the *Hampshire Gazette*.

North Carolina Gold Mines.—There are many extensive deposits where each ton of earth promiscuously taken up will yield 60 grains of gold, (\$2.25.) No mine is considered worth working, at which a hand cannot make a pennyweight (a bout 30 cents) per day, clear of the proprietor's share. First rate lumps consider they are doing bad business unless they can make 10 or 12 pennyweights (2 to \$11) clear per week. Good wages have sometimes been made by washing dirt over, that had before been washed five or six times.

Catadids, or Kitty Dulids.—These insects usually appear in the month of August. The music is performed by the males; it is a love song to attract the females. The noise is made by flat plates, one on each wing, near the back, which are grated together with great rapidity. In warm, fruitful seasons, the catadids appear early in August; in cold seasons, the latter part of the month. In the cold dry season of 1816 they were not heard the first week in August.

Niagara Falls.—In July last, Capt. Basil Hall, of the British navy, went behind the sheet of water at the Falls of Niagara, to make some experiments with the barometer. He says there is within the sheet of water a violent wind, which exceeds the most furious squall he ever met with, and he remarks that every stream of falling water produces more or less a blast of this nature.—[The trembling and clattering of the windows and doors in Northampton are undoubtedly the effect

of the water falling over the falls on Mill River, especially that at Mr. Clark's mill. Air is carried down by the falling water, a wind is produced behind it, and the surrounding atmosphere is disturbed to a considerable distance.]

Previous to the eruption which destroyed Her- culaneum and Pompeii in the year 79, Vesuvius was to appearance an extinct volcano, and history had given no account of any eruption. His crater was covered by vegetation, and its slopes by vine- yards, fields and villas. Spartacus and the Roman insurgents took refuge in this crater, when pursued. On the 24th of August, A. D. 79, the tremen- dous eruption took place. A dense cloud over- spread the whole neighborhood of Naples with profound darkness: volumes of ashes en-umbered the earth to a great distance; terrible flashes of fire pierced the cloud; the ground heaved; the sea receded; and three entire cities, Stabia, Her- culaneum and Pompeii, were buried under a heap of ashes and stones from 63 to 112 feet in depth.

A new principle has been recently discovered in black pepper, called piperine, which is proved, from careful experiments, to be a successful remedy in intermittent fevers, and has been employed with advantage in typhus fever and periodical headache. It may be given in doses of from one to four grains.

In the southern part of France near the Rhone, is a volcanic district, comprising an area of about 2000 square leagues. Here are regularly formed craters, currents of lava extending many miles, and many other decisive proofs that volcanic fire has covered this fine country with floods of molten rock. The formation of these volcanic regions was before the records of history, but after the existence of animals, bones of which are found imbedded in the volcanic matter. Among them are the elephant, rhinoceros, hippopotamus, ox bear, panther, hyena, &c.

The Saturday Morning Herald gives the follow- ing review of the weather market. It is as well to laugh as to cry, under the infliction of wet feet, coughs and sore throats.

Umbrellas—Raised considerably since our last.

Wet Boots—Heavy and hard to be got off.

Spirits—Dull.

Mud—Plenty and brisk—large lots taken up by travellers; city holders part with the article freely at a small advance.

Cloaks and Great Coats—Much sought after—and kept close by holders.

Coughs and Colds—Abundant—some few cases have been got off by physicians.

Rain—Falling continually—dealers very cau- tious of entering into it."

Children.—The following from the *Middlesex Gazette*, upon the management of children is cor- rectly conceived;—

Very few boys will be insulting, or mischievous, or backward at school, who are properly managed at home. And a majority of parents, being freed of the noise, roguery and ill behaviour of their children at home, send them to school with no rules or lessons for their conduct, expecting the master in the plenitude of his wisdom & leisure to make them fine scholars, and fine gentlemen, and amiable men and women all at once, and all this is expected many times without a frown or blow, as though it were perfectly easy for a school teach-

er to make of forty boys at school, what a parent cannot make of two at home. "The milk of hu- man kindness" in children is often spoiled at home, and parents wonder they do not grow right up at once, just as they ought to in every particu- lar, under the tuition of their teacher.

An association is forming in Pennsylvania to promote the cultivation of the Mulberry and the raising of silk worms. Some enterprising gentle- men in Peterborough in this state, are engaged in the same pursuit.—*Keen Sentinel.*

A buck with a cigar in his mouth entered Mr. Cross's menagerie last week, when Mr. Cross re- quested the visitor to take the "weed" from his mouth, lest he should learn the monkeys "bad hab- its."

I never knew a truly estimable man offer a finger; it is ever a sign of a cold heart; and he who is heartless is positively worthless, though he may be negatively harmless.

The brace of precepts and anecdotes which fol- low, are from the pen of that prince of gastronomes, Dr. Kitchener, too early alas removed from this mundane sphere. They are taken from his latest work—"The Traveller's Oracle."

Precept 1.—"To put the feet into warm water for a couple of minutes before going to bed is very refreshing, and inviting to sleep;—for promoting tranquility, both mental and corporeal, a clear skin may be regarded as next in efficacy to a clear conscience."

Precept 2.—"A respectful and humble carriage is a mighty advantage to gain knowledge—it un- locks the heart of every one."

Anecdote.—Visited one evening with Mr. R. Tavis, the master of the house invited R. T. to play at whist—who immediately gave him one of his significant stares and said, "No—No—pray, sir, what have you seen me do since I came into this room so exceedingly silly, that you ask me to play at cards?"

AGRICULTURAL BOOKS.

For sale at the office of the *New England Farmer*, a variety of standard works on agriculture, horticulture, gardening, breeding of cattle, &c. among which are Deane's *New England Farmer*—Farmer's Assistant—Shepherd's *Code of Agriculture*—London's *Encyclopedia of Agriculture*—Memoirs of the Pennsylvan- ia Agricultural Society—Hints to American Husbandmen—Lawrence's *New Farmer's Calendar*—Thacher's *Orchardist*—Cook on Fruit Trees—Hayward on Horticulture—Fruit Grow- ing Instructer—Speeches on the Vine—Malouin's *Gardener*—Cobbett's *American Gardener*—Cobbett's *Cottage Economy*—Cobbett's *Code in France*—Hogg on the Culture of Flowers—Kirwan on Manures—Lard on Sheep—Marshall on Gardening—Need's *Villa Garden*—Fiorbarr's *do.*—Holdich's *Essay on Weeds*—Agricultural Reader—Tomlin on Bees—Bakerell on Wool—Grey's *British Plants*—Nuttall's *Botany*—Tenny's *Botany*—Farmer's *Almanac*, and *Spices*—Magazine, &c.—Agricultural Libraries and others supplied on favorable terms.

Lucerne Seed.

A few hundred pounds of fresh Lucerne seed, by the pound or hundred weight, for sale at the N. E. Farmer office.

White Mustard Seed.

For sale at the office of the *New England Farmer*, the best English White Mustard seed, by the pound or bushel.

Early Peas, Tree Onion, Poppy Seed, &c.

For sale at the *New England Farmer* office, fresh seed of the Large Poppy, Early Peas, Tree Onion, White Clover, Lima Squash, &c. With the greatest variety of seeds to be found in New England.

Published every FRIDAY, at Three Dollars per annum, payable at the end of the year; but those who pay within sixty days from the time of subscribing, are entitled to a deduction of Fifty Cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor

VOL. VI.

BOSTON, FRIDAY, FEBRUARY 8, 1828.

No. 29.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

A USEFUL ARTICLE OF AMERICAN MANUFACTURE.

[The following is a copy of a Letter addressed to the Hon. JOSIAH QUINCY, Esq. Mayor of the City of Boston.]

Sir,—I send you a sample of that article commonly called *Grouts*, by foreigners.

I have taken the liberty, (being a citizen of the State of Vermont) to give the article a new name, **VERMONT RICE**.

The grain from which this article is manufactured, is common in all sections of the United States, particularly in New England. I have been in the habit of manufacturing it for about twenty years, and am decidedly of an opinion, that in the New England States it ought to take the place of southern rice.

Vermont Rice is prepared and cooked in the same manner the southern rice is, except that it takes a little longer. It makes excellent puddings to eat with milk, and when prepared and properly dressed, with spices, eggs, &c. it will make a baked pudding superior to rice; and, I have no hesitation in saying, that it is preferable for food, either in health or sickness. It is now kept by all druggists in New England, in a pulverized state; retailed for medicine, and recommended and approved by all physicians.

Perhaps, Sir, you will be surprised, on being informed that this article is nothing more than the kernel of our common oats: I refer you to my communication to the Editor of the *New England Farmer*, published in vol. 1. page 258 of that paper. From common oats, weighing not less than thirty-two pounds per bushel, I manufacture oat flour and meal. Oats weighing 38 pounds per bushel and over will answer, when properly manufactured, for this species of rice.

I will observe here, that oats which are designed for meal or rice, require to be harvested early, and well preserved. Oats which are wet in the field, heat in the mow or bin, are unfit to make either oat flour, meal, or rice. I design to furnish a friend of mine in the city of Boston with the first quantity of oat flour, meal, and Vermont rice of my own manufacture, and the same will be offered for sale by the pound or barrel.

I also manufacture, extensively, Pearl Barley, not equal, however, in point of *appearance*, to the foreign, but equal in *substance*. Any gentlemen wishing for more particular information respecting the manufacturing of oats, or wishing to purchase any quantity of the aforesaid manufacture articles, will please address a line to me.

Yours, with respect,

HENRY STEVENS.

Barnet, Vermont, Feb. 1st, 1828.

[The following is the communication referred to above.]

OATS.

“The subject which I propose, is that of the more extensive cultivation of oats. Various are the kinds of oats. The Barley or Scotch oats, so called, I have cultivated, but not with very great success; their weight is generally about 42 lbs.

per bushel. I have seldom been able to raise more than from 20 to 25 bushels per acre. The black oats I have cultivated; their weight is about 36 lbs. per bushel, and produce about as many bushels per acre as the barley or Scotch oats. The greatest objection I have to the barley or Scotch oats, is, that they must be harvested suddenly after they are fit, in order to prevent waste. The common oats which are raised, I consider preferable. My average crop of late years has been from 40 to 50 bushels per acre, and in one instance 65 bushels per acre.

I make oats principally, and generally speaking, my first crop in the line of a rotation of crops. I break up the piece intended for this crop in the fall, if possible, and in the spring cross plough and harrow thoroughly before I sow my grain; then harrow again until the turf is well pulverized; then sow ten bushels of clover seed chaff per acre, and roll it in. As soon as the grain is harvested, and the young clover has received its growth, I plough it in. This clover with the stubble, is about equal to a common dressing of compost manure. In the fall, plough; in the spring I cross plough, after taking from my compost heap thirty loads per acre, which are carefully spread. The lot then being well harrowed and furrowed is ready for planting, either with corn, potatoes, or turnips. This is my second crop.—For my third crop I again sow wheat, peas, flax, oats, &c. and stork the lot down with herds grass and red top, which I believe make the best of hay. I let the lot remain in grass three years.—Thus you will observe I till three years, and mow or pasture three years. My first and third crop is principally oats.

I have frequently been told that oats and corn were very impoverishing crops; but I find no difficulty in enriching my land as above stated. Ten years ago my average crop of corn was from 30 to 40 bushels per acre. But in passing over a lot the second time which was managed as above in the summer of 1821, I had the satisfaction of harvesting 96 bushels of corn per acre, and received the Society's premium. My other crops have advanced in about the same proportion.

The inquiry will naturally be made, what I do with my oats? Well, sir, after I have reserved for my stock and for seed, I take the remainder to my mill and manufacture them into flour and meal. It will be understood that the oats are kiln dried, then hulled about as clean as rice, then ground, and bolted or sifted, as the case may be. That which I bolt is calculated to be mixed with wheat flour for bread; in which case the oat flour being kiln dried, must be scalded before it is mixed with the wheat flour, otherwise the bread will be too dry. Good oat flour, prepared as above, mixed with wheat flour, half and half, will make as light and pleasant bread as common country wheat flour, and it will trouble good judges of bread to tell it from clear flour bread. Again, it is excellent to make butter-cake, by the Yankees called slappacks. The oat meal is calculated for puddings, and is a substitute for rye meal to mix with corn meal for bread, or with rye meal for bread. In either case the oatmeal must be scalded before it is mixed.

Thus after supplying my family, the remainder is for market. The oat flour I have generally sold in Boston and New York to the druggists. The meal is also purchased by the druggists. I have generally sold them oat flour for from four to five dollars per hundred, and the meal from three dollars fifty to four fifty, which is, by them, retailed as medicine, from twelve to twenty cents per pound.

The meal is frequently bought by foreigners in the barrel or hundred, for family use. The sale of oat meal is at present limited; the reason is that but very few people in this country, save foreigners, are acquainted with the use of it, except for medicine. Foreigners generally prefer oat meal to flour. I really hope both for our health, and the interests of agriculture, that the time is not far distant, when oat flour and meal will be used in every family for food.

Much may be said as to the value of this for medicine, as well as for food. It has been a common article for food in Scotland and Ireland for many years. Seldom, if ever, an English, Scotch, or Irish vessel sailed without a supply of oat meal;—and I may say it would be well for every commander of an American vessel, in making up his order for ship stores, to include a sufficient quantity of oat meal or flour for his voyage.

As I am one of the homespun family, and wish for information, I hope these few remarks will draw something from more able writers.

H. STEVENS.

SHEEP AND WOOL.

[Translated from the *Bulletin des Sciences Agricoles*, for July, 1827.—By the Editor of the *Hampshire Gazette*.]

Sweden was the first nation that imported merino sheep from Spain. The earliest attempts to improve the native breeds were unfortunate, but in 1715 the efforts of the Swedish minister were successful.—Merinoes were introduced into Saxony in 1765. The number first purchased was 229. Saxony has attained to a greater degree of perfection in this branch of industry than any other nation.—In 1775 Maria-Theresa, bought 300 merinoes in Spain; these were the first that appeared in Austria.—The attempts of Prussia to introduce merinoes were not successful until 1816, when the king made large purchases in France.—The French government purchased 367 merinoes in Spain in 1786, and placed them at Rambouillet. They have since spread over the kingdom.—It was not till 1790 that merinoes were imported into England. They had many prejudices and much opposition to encounter; they have not been extensively propagated in that country.—The English love fat mutton, and prefer those breeds which will furnish them with the finest meat. They import merino wool from Spain and Saxony.—Italy has never attempted to improve her native breeds.

M. Ribbe endeavors to prove that there is a greater profit in crossing native sheep with merinoes, than in forming flocks entirely of the latter. [According to the experiments of Dr Parry, a merino cultivator in England, the fifth cross brings the wool of the progeny to the same fineness as that of the merinoes.]

The various sorts of wool are coarse or fine, long or short, hard or soft, elastic or brittle, round or flat, crisped or not crisped. The fleece should be thick, and if it be well filled with oil, it is a sign of its excellence. The hairs or fibres of merino and Saxony wool should be round, even, bright, pliant, not breaking easily, and of suitable length. When wool unites these qualities, it is called in Saxony, Electoral wool.

[The wool of the sheep is nothing but crisped hair; in some varieties it resembles the hair of oxen, and in others the hair and wool are mixed.]

The filaments of merino wool should be well crisped or waved; the fineness of the fleece may be determined from the number of these curls and from their smallness. Wool of a superior quality has commonly 20 of these little beads. If merino sheep are not sheared, the wool continues to grow several years, but its growth diminishes every year, until it entirely ceases in the sixth, or at the latest, in the eighth year, when the extremities perish and become brown. The small races of sheep produce more and better wool than the large ones. Sheep with broad heads do not yield so fine wool as those with slender heads.—Merinoes at their birth are covered with little locks or tufts of curled wool, about as large as a grain of barley; the smaller these locks are, the finer the fleece will be; the closer they are together, the more abundant will be the wool.

CULTURE OF MANGEL WURTZEL.

Every man who assists in introducing the successful cultivation of any new variety in animal or vegetable life, which was before unknown or practised, and which promises to be more useful than any one of the like genus or species, before cultivated, deserves well of the public. This service, every farmer has, at times, an opportunity of performing. The Mangel Wurtzel holds forth this promise, in a more eminent degree, perhaps, than any other plant. It may be attempted, with hardly the possibility of disappointment or loss. There can be but little or no trouble or expense in making the experiment.

Why, then, will not every farmer, or horticulturist, make the trial in a small way, if it be not convenient to extend it beyond a little spot on his farm, or bed in his garden?

The Mangel Wurtzel is the *Beta-rufa* of the family of the *Beet*, sometimes called the *Root of Scarcity*, and likewise called the *White Beet*, much celebrated in England and Prussia.

Time of sowing, months of April and May.—Prepare a plat or field, as for turnips or potatoes; open two drills with the plough, two feet apart, and put in a sufficient quantity of dung, according to the ground; then cover the dung with the double mould board plough once, or the single plough twice, by ridging them up as high as can be well done, with a man shovelling between the drills right and left, smoothing the surface of the ridge above the dung, which will leave a space of ten or twelve inches broad. This complete method of following will repay the trouble of shovelling, by raising a full proportion of earth under the roots. After sowing, it should be well rolled, which completes the whole process. The crop to be afterwards treated the same as that of turnips or potatoes, by pulling and taking off mould, &c. After the roots have been raised, the ground is in a remarkable fine situation for wheat or any other crop; sow five pounds per acre.—

Soak the seed in pond or rain water, previous to sowing.

USE.—Almost all kinds of animals eat the leaves and roots, with great avidity. Both are peculiarly good for feeding swine, and are not less eagerly devoured than corn. They are excellent for milch cows, and possess the quality of making them give a large quantity of the best flavoured milk. They are said to be equally useful for fattening cattle.

Col. Povel, of Pennsylvania, has raised at the rate of 2,065 bushels per acre, weighing more than 44 tons. Messrs. T. & H. Little, of Newbury, in 1824, raised on an acre 74,518 pounds of these roots.

From Cobbett's American Gardener.

GARDENING.

America has soil and climate for surpassing those of England; and yet she is surprisingly deficient in variety as well as quality of garden products. I am not alluding to things of ornament, or appertaining to *luxurious* enjoyments, but to things that are really useful, and that tend to the preservation of health, without which latter, life is not worth having. It is incredible to those, who have not had occasion to observe the fact, how large a part of the sustenance of a country-laborer's family, in England, comes out of his little garden. The laborers of England are distinguished from those of other countries by several striking peculiarities; but, by no one are they so strongly distinguished as by their fondness of their gardens, and by the diligence, care and taste, which they show in the management of them.

The reproach which Solomon (Proverbs, ch. 21, v. 30) affixes on the slothful and ignorant husbandman, they seem to have constantly in their minds; and to be constantly on the watch to prevent it from applying to themselves. Poverty may apologise for a dirty dress or an unshaven face; men may be negligent of their person; but the sentence of the whole nation is, that he, who is a sloven in his garden, is a sloven indeed. The inside of a laborer's house, his habits, his qualities as a workman, and almost his morality, may be judged of from the appearance of his garden.

It seems, at first sight, very odd that this taste for gardening should not have been preserved in America; but, it is accounted for by reflecting, that, where land is abundant, attachment and even attention to *small spots* wear away. To desire to possess land is an universal desire; and vanity makes us prefer quantity to quality. You may prove as clearly as daylight that it is better, in certain cases, to possess one acre than a hundred; but where do you find the man that prefers the one acre? When large parcels of land are undertaken to be cultivated, small ones are held in contempt; and, though a good garden supplies so large a part of what is consumed by a family, and keeps supplying it all the year round too, there are many farmers even in England, who grudge even a wheelbarrow full of manure that is bestowed on a garden. The garden may, besides its intrinsic utility, be made to be a most valuable help-mate to the *Farm*.

Every American Farmer, north of Carolina, at least, ought to have a Hot-Bed in the Spring.

HINTS TO NEW ENGLAND FARMERS.

“*First*. The improvement of the character and qualities of all our domestic animals. It would

not be extravagant to say that the expense and profits of raising stock would be beneficially affected by having the best races of every sort that are now known in Europe. New England will never be a grain country, any more than she will become the raiser of tobacco or cotton. But she can probably supply two millions of people with beef, pork and wool.

“*Secondly*. To do this, she may and must use for half a century her natural pastures, because she cannot afford at present prices, to break up her uncultivated lands, but she *can* raise, and raise to advantage, by a succession of crops, a sufficient supply of succulent roots, such as the Swedish turnip—the Mangel Wurtzel or white beet, carrots, and potatoes, to come in aid of her cultivated and natural grass-lands, to support, and improve the condition of her stock of animals, to the extent of double, nay, I believe, treble their present numbers.

“They will not, they *cannot* exceed the *demand*, that must regulate the supply, after all we can say or write, but much may be done to enable us to raise cheaper and better animals. If *cheaper* the *demand* will be greater. We have done much in this way, but much remains to do.

“*Thirdly*, we are very deficient in Horticulture. To be sure there is no great profit in cash arising to the farmer from gardening beyond the limits of twenty miles from a great town, but when men have arrived to the degree of comfort which our farmers generally enjoy, they ought to seek innocent luxuries. We cannot hope or expect to see their front yards ornamented like those of the Dutch or English cottages, who are not worth a twentieth part as much as they are, with flowering shrubs and plants, so neat and so beautiful as to realize the description of the poets, who have dejected on pastoral life. This depends in those countries on fashion, and as the more opulent indulge in those luxuries, the others follow as imitators; but a delightful pear—an excellent plum or peach, or an admirable winter apple, fresh in April, would be as sweet to the palate of a farmer as to that of a luxurious and opulent merchant, and why these are neglected, I never could comprehend, as the labor amounts to a trifle in procuring and in preserving them.

“No farmer ought to be without his asparagus bed, which, once laid down, will last without his labor for forty years—no one ought to be without his patch of green peas—lettuce—early and late beans. If more attention were paid to these comforts, we should hear less of spotted and typhus fevers in our otherwise healthy villages, and our females in the country would be more proud of the grounds about their houses, and take more interest in their neatness and comfort than some, perhaps too many of them now do. We do not mean to say, there are not a great many farmers who pay some attention to these things, but the deficiency is deplorable.”

From the Hampshire Gazette.
SHEEP AND WOOL.

The “*Boletten des Sciences Agricoles*,” for July 1827, contains a review of a German work on Sheep and Wool, by J. C. Ribbe—published at Prague, Bohemia, from which we have translated the following, save what is enclosed in brackets.

The author adopts the opinion of Linnæus, that all the different kinds of sheep which exist are derived from a common stock, the *Ovis Argalis*.

[On the subject of the mountain the Rocky Mountain sheep of Asia and Greece.] The largest species of sheep in Europe is the breed of Flanders, which the Dutch imported from India, about two centuries ago. The smallest race is that of Scotland. [M. Ribbe refers to the Hebridean sheep—a small breed which weigh from four to five pounds per quarter when fat, and yield about one pound of wool of various colours.—These small animals frequently carry four or six horns. This breed was imported into Scotland from Denmark at a very early period. There is now a race in Denmark, which have four horns.] The national sheep of Hungary, live, in both sexes, straight horns, from 12 to 14 inches long. The wool is five or six inches in length, and so coarse, that it is fit for nothing but blankets.

Iceland has two sorts of sheep, one large, the other small. Their wool is brown, and the inhabitants do not shear it, but pull it off—a most cruel operation. The Icelanders make great use of sheep's milk.—These animals live all the year exposed to the severity of the weather, and their principal food in winter, is the moss, called Iceland moss, which they obtain under the snow.—The small species live among the steep rocks on the mountains, and sometimes a flock is carried over a precipice into a gulf by an avalanche, where they remain until the warmth of the bodies melt the snow which covers them, and announces to the owners, by the steam which ascends, the place into which they have been carried.

In the Crimea, and some countries near the Caspian sea, they have sheep that bear, when young, short curled wool of a blue, brown, or black color, which is an object of commerce. That the wool may remain in small curls, the Tartars cover the lambs with a linen cloth sewed close around them, which is not taken off until the animal is killed. [The lamb-skins are celebrated, being damasked as it were, by clothing the animal.] In some of the vast forests of Russia, there are sheep which live in a wild state; the animals which are so much affected with the sounds of drums and trumpets, that they begin to run, leap and dance, as soon as they hear them; and they continue these motions until overcome by excitement and fatigue, they are no longer able to flee from their enemies.

[The largest breed of sheep in the world is the fat-tailed variety; it is raised in central Asia, China, Persia, Africa, &c. The tail is a mass of fat, and often weighing 30 pounds. Another variety of Asia is the long-tailed breed, with coarse wool; its tail sometimes drags on the ground.]

Europe did not possess any fine woolled sheep until the twelfth century. The Roman writers mention that fine wools and stuffs were imported from Spain, but this only proves that the Spanish sheep were better than those of the rest of Europe. In the twelfth century some African merchants sent to Cadiz a few sheep, the wool of which was remarkable for its fineness and whiteness. They were purchased by a Cadiz merchant, and placed on his country estate, where they succeeded, but he found no imitators.

About the year 1350, Peter, king of Castile, having been informed that there was a race of sheep in Barbary, which had precious fleeces, sent several persons into Morocco to buy a great number of bucks. From this epoch commenced the reputation of the wool of Castile. In the 16th cen-

tury, when Cardinal Ximenes was the Spanish minister, complaints were made to him that the sheep of Castile had deteriorated. To remedy the evil, this minister determined to import a great number from Barbary; but as he could not obtain them by means of negotiation, he kindled a war, and invaded Morocco.—The Spanish soldiers had orders to bring away as many sheep as they could; they pillaged the country, and returned to Spain with the precious plunder.

The principal breeds of Spain are those which the monks of the *Escorial* possess; those of the convents of *Gaudaloupe*, and of *Paular*; those of the duke d' *Infantado*, and of the counts of *Negretti* and *Montoro*. The sheep of the *Escorial* have the most beautiful wool; those of the *Gaudaloupe* are celebrated for their form and fleece; those of *Paular* have the head covered with wool and their neck full of wrinkles; those of *Infantado* are born with coarse wool, which afterwards becomes very fine, and those of *Negretti* have a strong and robust body, with fine wool. All these races are called merinoes, and were formerly the travelling flocks of Spain; since the late wars, they have become stationary. All the fine races of sheep now in Europe, were derived from the merinoes of Spain.

A letter has been received by the President of the Pennsylvania Agricultural Society, on the subject of establishing a Fellenberg School in this state. Of the plan and site alluded to in the letter, we do not desire to express an opinion; but upon the principles of the Fellenberg schools we presume there can be but one sentiment, that of approbation. In truth, so exceedingly judicious and proper do they appear, it is a matter of astonishment that they have to be introduced at this time of day.—*Penn. Gazette*.

From the Hampshire Gazette.

MR JENN—The notice in your last paper, of a successful operation of Oesophagotomy, performed by Doct. Blood, induced me to inform you that simply tapping a creature into the paunch, and keeping the incision open, are all that is necessary to be done to any creature that is choked with a turnip, potato, or apple. Not one out of a hundred will die, provided the incision be made before the intestines become ruptured. Creatures when choked swell and are in great distress, from the pressure of the internal air. Tapping in such cases gives instantaneous relief, and either of the above substances will in the course of seven hours become so soft that the creature will discharge it at the mouth or swallow it. I never found any bad effects from tapping, out of more than twenty cases. The operation is very simple and safe, when rightly performed. Any person can inform himself while slaughtering a creature, by observing where the paunch adheres to the side. Tapping is the best remedy, I think, for the disease called blown or hoven. The effect of the wound is not so bad as the inflammation in the throat after giving alkali.

A. L.

THE COFFEE TREE.

As it is not every one that has seen this singularly useful tree, a short description of it may be worth giving. It sometimes attains the height of 12 feet with a trunk of 15 inches in circumference, and very much resembles an apple tree of eight or ten years standing. The branches, which stretch all around like an umbrella, are extremely

pliable; the bark is of a whitish color, and rather rough; and the leaves, in shape not unlike those of the citron tree, are of a glossy dark green.—The blossoms, white as the jessamine flower, and of a delicate fragrance, shoot out at the stem of the leaves. When the blossom drops, a small green herry appears in its place, which growing red as it ripens, like a cherry, contrasts beautifully with the green fruit and numerous fresh blossoms, which appear upon the tree at the same time.

LIGHTNING RODS.

The American Journal of Science contains the following observations of Professor Hare, of Philadelphia.

"I should not consider a metallic rod, terminating, without any enlargement of surface, in the water or the earth, as an adequate protection against lightning; but were such conductors terminate in metallic sheets, buried in the earth or immersed in the sea, or by a collection duly made as with the iron pipes, with which our city (Philadelphia) is watered, or the copper with which ships are generally sheathed, I should have the most perfect confidence in their competency."

"It is not only important that the points of contact, between the metallic mass, employed to afford lightning an adequate passage, and the earth, or water, in which it terminates, should be so multiplied as to compensate for the inferior conducting power of the earth or water; but it is also necessary that the conducting rod be as continuous as possible. When conductors are to be stationary, as when applied to buildings; they should consist of pieces screwed together, or preferably joined by solder, as well as by screwing. Where flexibility is requisite, the joints should be neatly made, like those of the irons in fall top carriages; and should be rivetted so as to ensure a close contact at the junctures.

"If a pointed rod be cut into parts so as to produce intervals, bounded by blunt terminations, its efficacy will not be much greater than if it had no point; because the fluid will in this case pass in sparks, instead of being transmitted in a current. It is on this account I object to chains, or rods joined by loops, or hooks and eyes."

Protracted Lactation.—Dr. Morton concludes, 1. That, if children are suckled for an undue length of time, that is, beyond the period of nine or ten months, they will be liable, in consequence, to inflammation of the brain. This proposition is supported by seven cases of children affected with cephalitis, where the period of lactation had been considerably protracted.

2. That the same effect will take place, where the milk is furnished beyond the above period to a child, though that child may not have been at the female's breast from the beginning. This is supported by only one case.

3. That if the disease in question be not developed at once by the said protracted lactation, a pre-disposition to cephalic disease will be established. Supported by eight examples.

4. That children too long suckled, when taken ill with other diseases, are much more liable to suffer in the head than children reared in a different manner.—*Med. Chir. Review*.

The American Dictionary of the English Language, by Noah Webster, L. L. D. which is much looked for, is in press, and will be published as soon as a careful reading of the proof sheets will admit. It is supposed that the work will be completed about the close of the present year.

[From Silliman's Journal.]

ON FOREST, ORCHARD TREES, &c.
RENSSELAER SCHOOL, TROY, April 30, 1827.

Effects of light.—Clouds and rain have obscured the hemisphere during the last six days. In that time the leaves of all the forests, which are seen from this place, have greatly expanded. But they were all of a pallid hue, until this afternoon.—Within a period of about six hours, they have all changed their color to a beautiful green. As the only efficient change which has taken place is, that we have a serene sky and a bright sun, we may say with confidence, that this change of color is produced by the action of the sun's rays.

Seven years ago next month, I had a still more favorable opportunity to observe this phenomenon, in company with the Hon. J. Lansing, late Chancellor of this State. While we were engaged in making a geological survey of his manor of Blenheim, the leaves of the forests had expanded to almost the common size, in cloudy weather. I believe the sun had scarcely shone in twenty days. Standing upon a hill, we observed that the dense forests on the opposite side of the Scholastic, were almost white. The sun now began to shine in full brightness. The color of the forests absolutely changed so fast that we could perceive its progress. By the middle of the afternoon the whole of these extensive forests, many miles in length, presented their usual green summer dress.

Direction of the branches of Trees.—A tree shoots out its branches like all other trees of the same species, external circumstances being similar. But there is one remarkable fact in the direction of branches, which I have not seen noticed in any publication.

All trees with spreading branches, accommodate the direction of the lower branches to the surface of the earth over which they extend. This may be seen in orchards growing on the sides of the hills, and in all open forests. But the crowded situation of the wild woods of our country, prevents a sufficient extension of branches to exhibit this character.

This fact presents a curious subject for the investigation of the phytologist. The question presented is this: What influence can the earth have upon the branches on the upper side of the tree, which causes them to form a different angle with the body of the tree from the angle formed by the branches of the lower side, so that all the branches hold a parallel direction to the earth's surface?

Hollow Trees.—The growth of trees is not influenced by any circumstance connected with their internal woody parts.

Mr Knight's central vessel hypothesis, and the authority of numerous able physiologists, seem to be at variance with this position. I shall not enter upon a discussion of the subject, but merely introduce a few facts.

The sugar maple, (*Acer saccharinum*.) after being tapped and drained of its internal sap fifty years, and after the whole interior has become decayed, grows as fast and presents an aspect as vigorous and blooming, as any sound tree of the same species and same age, which stands by its side.—For the truth of this fact, I refer to all manufacturers of the maple sugar. I suggested this opinion more than twenty years ago, and frequently afterwards, when I was employed among the tenants of Messrs. Livingston, McEvers, Ludlow, Clatting, and others, between the spurs of Catskill

mountain. Every manufacturer with whom I conversed, in this native residence of the sugar maple, confirmed my opinion.

The common apple tree (*pyrus malus*) grows thriftily and bears abundance of fruit, many years after its interior is so completely rotted away, as to leave but a very thin hollow cylinder in possession of the living principle.

We prefer solid trees in our forests and orchards; because they have more strength to withstand the force of winds, and because the unfavorable circumstances, which caused the interior to decay, may effect the total destruction of the tree. But as all deposition of matter, in any way affecting the growth of the tree, are made between the bark and wood, after the first year, in the form of a mucilage, called *cambium*, it seems that the internal woody part has no influence upon the external growth.

Yours, respectfully,
AMOS EATON.

[Abstracts from Silliman's Journal.—by the Editor of the Hampshire Gazette.]

WATER CEMENT.

In Southington, Con. is an inexhaustible quantity of hydraulic limestone. It is burnt in a common kiln, like quick lime, and is next ground fine with mill stones. One part of it is then mixed with two of sand, to form it into mortar. It soon becomes firm and secure under the water. It is employed in the construction of canals, mill dams, cisterns, cellar walls, vats, and all kinds of masonry exposed to water. It has been used in the construction of the aqueducts and culverts on the Farmington canal.

FASCINATION OF SNAKES.

A correspondent of the Journal is convinced by ocular demonstration, "that the notion of a fascinating power in snakes is an utter fallacy and delusion. He thinks that birds flutter and hover round snakes and cats, to decoy them from their nests.

DOG TRAINS.

Dr Foot, at the military post at Sault St. Marie, near Lake Superior, describes the mode of travelling in that part of the world. Three dogs carry a man and his provisions and the traders travel all over the wilderness with them. The dogs are taught to turn, halt, and go by word of command. They are harnessed to the train or sleigh one before the other. Dr Foot says he frequently rides over the river, and a mile or two round, drawn by three dogs, and sometimes takes his wife and child. Those who travel with dogs, sleep in the woods in the coldest nights; they dig away the snow in a thicket, build a large fire, spread boughs of evergreens, and then lie down by the fire, dogs and all, and sleep comfortably all night.

[Further extracts from Prince's new work on Horticulture, now in press.]

RASPBERRIES.

This fruit was originally discovered by the Greeks, growing on Mount Ida, whence the specific name *Idæus*. At present we have not only many varieties of the above, but several other species, which are cultivated for their fruit in our gardens: among which the Common Red, which is sent to our markets in immense quantities, and

is largely used in the making of raspberry brandy; is of fine flavor and much esteemed, and is the most productive; also the White and the Red Antwerp, which are of very large size and high flavor—of these the White is generally preferred—they are both productive and excellent fruits. The American White and American Black are inferior in flavor, but are nevertheless esteemed by many persons, particularly the white variety.—The Twice Bearing, if properly managed, is quite an acquisition. In general, they produce one crop at the usual period, and a less one late in the season, but as a full crop is most desirable, it is said to be best to cut off the whole of the stalks quite to the ground early in the spring, in order to force a strong growth of young wood, which will yield a large quantity of fruit, as it is the wood of the same summer that produces the fall crop. The Red Cretan is a raspberry of delicate flavor; the Cane is also considerably cultivated, and a number of others; the Purple Flowering is only useful as an ornamental plant, its fruit being of no value.

Raspberries may be increased by cuttings, layers, or by the young suckers which spring up in numbers from the root; the latter method is generally considered to produce the strongest and most fruitful. Although this plant is no way difficult as to soil, still it is preferable that this should be fresh and rich, and as it does not flourish for a long period on the same ground, it will be necessary to form new plantations every three or four years. The situation should be half shady, or in a location not exposed to excessive heat. Every autumn the old wood should be thinned out, and only that which is young and thrifty allowed to remain—at the same period some well rotted manure should be dug in around them.

CURRANTS.

This fruit will flourish in all expositions, and in every soil, except one absolutely wet. The plants are generally increased by cuttings, with which the same precautions should be used as prescribed for those of the gooseberry. In autumn the old wood should be trimmed out, and it would be well at the same time to have manure dug in around them. There are a number of varieties, among which are the Common Red and White, the Dutch Red and White, the Champagne, or Transparent Pale Red, Wilmot's Pale Red, the Black English, and Black American—the foregoing are those cultivated for their fruit. There are also the Yellow Flowering, with fruit similar to the Black American, but of larger size and better flavor; and the Yellow Flowering, with yellow fruit, but not productive—these two are very ornamental for their flowers; also the Variegated Leaved, with red fruit—the Black English, with variegated leaves—and a number of others, calculated more for ornament than use.

STRAWBERRIES.

The situation should be an open exposure, but somewhat sheltered from the excessive heat of noon-day. Moisture, and a degree of shade, are natural to this plant, as may be inferred from the situations it occupies in a wild state. A sandy soil may cause an earlier maturity of the fruit but will not be conducive to an abundant yield.—A light rich loam is considered the most favorable, being soft and pliable, so that the runners may easily penetrate it with their roots. A mixture of bog earth is found advantageous; and, in

enriching the soil, cold manures are to be used. In the southern States, I should consider the best situations for this plant to be the north sides of hills, or the shady borders on the north side of a garden fence or a hedge. The plantations in the vicinity of New York, and which furnish that city with this fruit, are generally made by plain farmers, on good loamy soils, which are light and mellow, occupy open and unsheltered fields. The yield from them is immense, and they are considered among the most advantageous appropriations of the soil.

FORMING BEDS.

The most favorable season to form beds, is in September or October, which gives the plants sufficient time to establish themselves, and become well rooted before the ground freezes, and thereby prevents their being thrown out by the winter frosts. In forming these beds, you should select strong and vigorous runners, or offsets, in preference to taking old plants: these may be placed in beds from three or four feet wide, and from ten to twelve inches apart each way, according to the extent to which the variety usually expands in its growth. Most varieties do best when allowed to run together, so as to form a complete mat—as in this case one forms a shelter for the other from excessive heat—but where the fruit is desired of the largest possible size, the plants must be kept distinct, and at the distance of one foot asunder, and the runners should be cut off as they appear. By some persons it is recommended to make plantations in the autumn as before stated, and to keep them covered of all winters till after the maturity of the fruit the ensuing season.

As beds of strawberries generally want renewing every two or three years, it will be necessary, in forming the new beds, to select the plants in the proportion of one bearing plant to one barren; and, in order to do this with certainty, it will be best to mark them when in fruit. If, however, your beds are not encumbered with a superfluous number of barren plants, this precaution will not be indispensably necessary; though it is generally requisite with the varieties of hantbois, the red Chili, pine apple, and some others, which are apt to produce a great proportion of barren plants—and even, without proper attention, beds of these, and of some other kinds, will become almost totally unproductive.

With respect to the varieties of the Maine, or monthly, it is preferable to form new beds every autumn, as the runners of the previous year produce a much greater quantity of fruit than the old plants.

LIMESTONE.

Professor Hitchcock, in his Agricultural Address, states that limestone capable of forming the water proof cement has been found in Southington, West Springfield, and at Mount Tom, and he remarks that we may expect to find it in other places in the valley of the Connecticut.

It has been known for many years that a coarse kind of limestone existed in Williamsburgh, Whately, Conway, Goshen, Chesterfield, Deerfield, Ashfield, Buckland, &c. Professor H. has recently burnt some pieces of this stone and converted it into quick lime. On being slacked, and mixed with a quantity of sand, it formed a dark colored mortar, which hardened as soon, and to as great a degree, as lime mortar in general.

Professor H. is not without hope that gypsum

(plaster of Paris) may be found in the towns where the coal formation exists—viz. Springfield, West Springfield, South Hadley, Granby, Sunderland, &c. He says all light colored and soft rocks found in these towns should be examined with care. If they do not effervesce by pouring on oil of vitriol or aquafortis, they will probably prove to be gypsum. If they do effervesce, they are limestone.—*Hampshire Gazette.*

THOROUGHWORT.

There are numerous species of this plant, which are natives of our soil. This species has long been familiarly known throughout the U. States, by the various names of thoroughwort, boneset, Indian sage, crosswort, vegetable antimony, &c. It grows abundantly in low meadows and marshy situations. The stem is erect, and rises from two to four or five feet, perforating the leaves at each joint, and is hairy or woolly, and branches only at the top. The leaves are horizontal, serrated and rough, from three to four inches long, and about an inch broad at their base, gradually lessening to a very acute point, of a dark green, and covered with short hairs. The flowers are white, and appear in July or August. The medicinal properties of this very valuable plant have been thoroughly investigated by numerous persons, one of the first and most accurate of whom is Dr. Anderson, of New York. He deems it warrantable, to conclude, that it possesses many properties similar to those which characterize Peruvian bark, camomile, and other valuable articles used in medicine, but that these virtues reside in the greatest degree in the leaves. As medicinal preparations of this plant, the author recommends the decoction of the flowers and leaves; infusions of the same parts; the leaves in substance powdered—and a tincture of the flowers and leaves, prepared with proof spirits. The last form had better be expunged. It is said without hesitation, that the glymphical properties of thoroughwort, as deduced from experiment, are in many respects exactly similar to the Peruvian bark; and that for its acrid medicinal virtues, particularly as a sudorific and as a tonic, it will not suffer by a comparison with any of the articles found in the vegetable kingdom. Among others, Dr. Barton, and Dr. Hosack have observed its efficacy as a remedy in the treatment of most febrile diseases, particularly intermitting and remitting fevers, yellow fever, and various other disorders; cutaneous affections, and diseases of general debility. If exhibited as a warm decoction, it often proves an emetic, and acts especially on the skin, producing copious perspiration; if in form of cold infusion or decoction, or substance, it acts as a powerful tonic. An infusion of thoroughwort has long been esteemed as an efficacious remedy in bilious colic accompanied by obstinate costiveness. It is directed in the quantity of a tea-cup full every half hour, until it operate downwards. In a similar manner, it has been successfully prescribed in dysentery, with the view of both its cathartic and diaphoretic effects. About two quarts of a strong infusion of thoroughwort, with the addition of an ounce of aloes, form an excellent purgative for horses and cattle.—*National Philanthropist.*

Boston and Providence Rail Road.—In their report, which makes ninety-four pages of letter press the commissioners say—"according to the estimates, the passages of persons will be equiva-

lent to 59,600 over the whole length of the road, at \$1 each—the transportation in wagons equivalent to that of 8,350 tons through the route, 4625 tons at an average price of \$4.75 per ton, and 3825 tons (7 1/2 cents per mile per ton) at \$3.15 giving the gross receipts of \$4,000; deducting from which 6,750 for expense of horses, carriages and drivers for conveying passengers; 2,506 for expenses of the heavy transportation; also ten per cent, on these amounts to cover any error by under estimates of these expenses, and allowing \$4000 per annum for superintendance and repairs, making nearly 15,400, leaves a net income of a little over \$68,000."—*Boston Patriot.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 8, 1828.

FREQUENT PLOUGHING, AND PLOUGHING IN RIDGES.

A writer in London's *Gardener's Magazine* says—when a soil is tenacious, or abounding in stubborn vegetable matters, as in heath lands, it cannot be too completely exposed to the action of the air; but to light soils, which are in general deficient in organic decomposing matters, chemistry would say that ridging is accompanied by evils more injurious than can be compensated by the benefits obtained; for such light soils are easily pulverized whenever occasion requires, are so porous as at all times freely to admit the pervasion of the atmosphere; and, therefore, by this extra-exposure, the vegetable and animal remains are hastened in decomposing, and much of their fertile constituents evolved in the state of gas, or carried away by the rains, &c. without there being any crop upon them to benefit by them. Thus theory argues, and practice certainly seems to support, in this instance, her doctrines." Switzer, one of our horticultural classics, says, "rich heavy ground cannot well be ploughed too often, to make it light, and the better manure by killing the weeds; as light, poor ground, cannot be ploughed too seldom, for fear of impoverishing it."

ROOTS OF PLANTS.

"A root is annual, biennial, or perennial. In the two former instances, if the individuals to which they belong be allowed to perfect their seed, no care can protract their existence beyond the ensuing winter, however genial the temperature, &c. in which they are made to vegetate;—but, if the ripening of seed be prevented, it is undetermined how long they may in most instances be sustained in life. I have known nicotianette, continued in healthy vegetation for four years with this precaution. In all roots, and under any mode of management, the fibrous parts (radiculae) are strictly annual; they decay as winter approaches, and are produced with the returning vigor of their parent in the spring. Hence the reason that plants are transplanted with most success during the season of their decay; for as the root almost exclusively imbibes nourishment by the mouths of these fibres, in proportion as they are injured by the removal, so is the plant deprived of the means of support: that sap which is employed in the formation of new fibres, would have served to increase the size of other parts.—The size of the root, I have always observed to increase with the poverty of the soil in which it is growing. Duhamel found the roots of some young oaks in a poor soil to be nearly four feet

long, though the stem was not more than six inches. The cause of this is evident; the nourishment which is required for the growth of the plant, can only be obtained by an increased wide extending surface of the root, and to form this, more sap is often required than the plant, owing to the poverty of the earth, can obtain to itself; in that case a soil is sterile, for the plant must evidently perish.

A root always proceeds in that direction where food is most abundant; from a knowledge of this fact we should be circumspect in our mode of applying manures, according to the crop and object we have in view. The soil in my own garden being shallow, never produced a carrot or parsnip of any size; but almost every root consisted of numerous furks thickly coated with fibres; digging two spades deep produced no material advantage, the gardener applying as usual, manure to the surface; but by trenching, and turning in a small quantity of manure at the bottom, the roots always spindle well, grow clear, and have few lateral fibres. For late crops of peas, which mildew chiefly from deficiency of moisture to the root, it is an object to keep their radicle near the surface for the sake of the light depositions of moisture, incident to their season of growth; hence it will always be found of benefit to cover the earth over the rows with a little well rotted dung, and to point it lightly in."—*Ibid.*

REMARKS ON SALT AS AN APPLICATION TO SOILS.

A writer in London's Gardener's Magazine says, "I have lived very much near the sea beach as well as near salt-works; I have watched the effects of the sea breeze and salt spray, and always found it rather prejudicial to vegetation than otherwise. The pamphleteers will perhaps say that this was owing to the saline particles not being distributed scientifically; they were either sown too thick or too thin, or not at the right season; the salt should be measured by the imperial bushel, and weighed by the patent beam and scales, by men of rank and science." I acknowledge that I possess neither rank nor science, but I hope I possess a common share of common sense, and, as Providence has ordered it, I possess rather more than a common share of experience; and I refer to the most sensible part of your readers, if a given distance from the sea would not determine the case with as great precision as weights and measures; but such point I could never find. We have all seen a heap of rank manure lying in a field; we have seen it destroy vegetation for several inches all round; then all at once vegetation sprung up most luxuriantly, then gradually diminished, till the effects were lost in the natural verdure of the field. But, when a heap of salt lies in a field, it, like the dung, destroys all vegetation round it; but where is the point of luxuriansness? where is so much as a fairy ring? so where to be seen, the potential effects of it diminish as gradually as those of the poison tree which we read of in the Island of Java; or, if certain vegetables seem to thrive, they are of a particular kind, more resembling marine than terrestrial natives, and are actually feeding on the murdered carcasses of their more delicate neighbors. Facts like these, might teach a child that salt was not a manure, although extremely good and useful for many things. It destroys weeds and worms: dead weeds and dead worms are an

excellent manure. But, if destroying a perverse and rebellious generation of vegetables, to make room for a better, be manuring, then a naked summer fallow is manuring; or, if cutting off nine plants to make room for a tenth, be a manure, then a turnip-hoe is a manure; for, though only a piece of steel on the end of a stick, it has often procured me forty or fifty tons of turnips per acre instead of four or five. By way of explanation, I sow nearly four pounds of turnip seed per acre in drills thirty inches asunder, so that, without the hoe, they would be little better than so many rows of cress or mustard. "But," says the man of science, "salt enters into the constitution of plants and therefore must be manure." I grant that it does enter into the constitution of certain plants, and I have witnessed some extraordinary good effects from its application; and I could fill several sheets on that side of the question, but am engaged at present on the opposite side. It hardens the straw, that would otherwise be flaggy—it makes the grain plump, that would otherwise be shrivelled—in short, its uses are extraordinary, if applied with judgment; but to call it a manure, is a kind of false philosophy which I should like to extirpate from the rising generation, as it would only lead to futile experiments, foolish arguments and false conclusions. I make use of great quantities of salt every year, and did so before the duty was taken off, both rock salt, and salt and ashes. I was then obliged to swear what I was going to do with it, and what I had done with it, and also give an account of the experiments I had tried with it, some of which have helped to make up the pamphlets I have read; but now I have no more trouble than if carting from a dunghill. I was at a salt-works a short time since, and, I suppose, the greatest salt works in Europe; I bought a three horse cart full for ten shillings;—they loaded it into the bargain, only one of the men begged sixpence to drink, as he said he had made me a good load, and trod it well so as not to shake off. I thought he spoke true, and gave him the sixpence. I weighed it, and measured it, after getting it home;—it was *thirty-seven* and a half hundred, and measured *sixty-two* imperial bushels. Now, this was not salt and ashes, but fair, good salt, only not quite fit for a silver salt-cellar; so, if any one wants salt manure, [as they call it] I think I can tell them where the cheapest shop is. I asked a great many questions of the agent, and also of the neighboring farmers, the substance of which would occupy several letters; but all that I could write, or indeed all that others have written or could write, may be comprehended in the following parable:—A certain man had two sons; they were twins, very much alike in every thing, and in nothing more than in their delicate complexion, and weakly and sickly appearance—they were troubled with worms, a weak digestion, &c. One of them was put under a course of physic, which nearly killed him;—but he however got well, and grew quite fat and jolly; the other lingered on for some time, and died at last, although he had always as much roast beef and plum-pudding as he could set face to. The old man made the following remark, which passed current through the country; that physic fattened the one, and roast beef starved the other; and the putting apothecary, who sold the physic, began to collect evidences of the marvellous cures which his medicines had performed, and employed certain scribblers to write in favor of it, some of

whom over-shot their mark, and published treatises to prove the extraordinary feeding and fattening powers of Glauber's salts."

FARMS.

A writer in the Mass. Agric. Repository, vol. v. page 320, in treating "on the extent of land necessary for a farm, and sufficient to support a family well and independently," has the following among other valuable remarks:—"We know men, active, intelligent and industrious, possessed of thirty or forty acres of land, who are labouring for others, or taking charge of their neighbours' concerns, upon the avowed reason, that they cannot support their families on so small an extent of land. But they do not realize the actual efficiency of the soil. Undoubtedly there are many honourable exceptions to the observations we are about to make; as a general rule, however, it may be asserted, that THE FARMERS OF MASSACHUSETTS ARE YET TO LEARN THE IMMENSE PRODUCTIVE POWER OF A PERFECTLY CULTIVATED ACRE. Instead of seeking riches in augmenting the number of their acres, let them be sought in better modes of husbandry. As a general truth, we believe it may be asserted that every farmer in Massachusetts, possessed of one hundred acres of land, might divide them fairly by quantity and quality, into thirds, and by a suitable cultivation, make either third more productive than his whole hundred acres are at present. This is the operation at which those interested in the agriculture of Massachusetts ought to aim—to make farmers realize what cultivation can effect, and to teach the modes, by which the productive powers of the soil can best be elicited. It is indispensable for the success of every undertaking that a sufficient capital to carry it on, should be at command; and for that of farming in particular. When there is any deficiency with respect to that important particular, the farmer cannot derive sufficient profit from his exertions; for he may often be obliged to dispose of his crops at an under-value, to procure ready money; or he may be prevented from purchasing the articles he may require, though a favorable opportunity may present itself. An industrious, frugal, and intelligent farmer, who is punctual in his payments, (and hence in good credit) will strive with many difficulties, and get on with less money, than a man of a different character. But if he has not sufficient stock to work his lands properly—nor sufficiency of cattle to raise manure—nor money to purchase the articles he ought to possess, he must, under ordinary circumstances, live in a state of penury and hard labor; and on the first unfavorable season, or other incidental misfortune, he will probably sink under the weight of his accumulated burdens. In general, farmers are apt to begin with too small a capital. They are desirous of taking large farms, without possessing the means of cultivating them. This is a general error; for it makes many a person poor, upon a large farm, who might live in comfort, and acquire property upon a small one. No tenant can be secure without a surplus at command, not only for defraying the common expenses of labor, but in case any untoward circumstance should occur. When a farmer on the other hand, farms within his capacity, he is enabled to embrace every favorable opportunity of buying with advantage, while he is not compelled, if the markets are low, to sell with loss."—*Code of Agri.*

MISCELLANIES.

Whatever diversity of opinion may be entertained respecting the merits of the subject of the following eulogy, we believe all persons of taste will award it the need of praise to the poetry.

If Mr. FERRISS thinks the following lines (written by an American who visited Napoleon's grave on the Island of St. Helena shortly after his death), worthy a place in his paper, he will oblige a subscriber by inserting them.

THE GRAVE OF NAPOLEON.

Lora is the rock, and boundless is the wave. Where the weird swine dug Napoleon's grave: A castled steep—the sea for ever pours A requiem round these solitary shores.

No tender brother stood beside his bed. No weeping parent held his drooping head. A few sad fellows, faithful to the last, Watched the quark change, that his face o'ercast. Saw the fixed eye, with lingering lustre view. His boy's bright portrait, as he bade adieu: Sublime in death, he said, with hope inspired. "My son, the best of times!" and expired.

Near one small fount, in yonder glen of green, Where elf's stipulations guard the sacred scene, And strange records tread with noiseless step the glade, Lest the rude echo should thy rest invade— Great shade of fame! Where hath thy spirit fled. In the dark regions of the unknown dead? Where is the urn which raised, with wondrous power, Our kings and emperors to a happier home? Where is the form, which on yon Alpine height, The Italian rears, in wild with pale alight? Whom seemed to travel o'er space and time, The gaze of crowds—the wonder of each clime? Wide Europe's trembling, say, with hapless eye The world's artillery, like a whirlwind fly! Where is he now? Go, ask the watchman there, Whose armor glitters in the midnight air. (He pants in silence, to the lonely tomb, Where Bertrand wept in agonizing gloom!

Oh will the pilgrim to the East, pause here. Muse on this spot, and shed a pitying tear: That his vast genius, and his mighty mind, Should sink, by necessary force confined. Oh will the son of ocean, check his oar, And drop their anchor near this sainted shore? Through the dark wailing valley slowly turn, And, passive, gaze at great Napoleon's urn. Here, many a tongue will pay the tribute due. To Bertrand's heart, so loyal and so true: Who shared his glory, and who shared his fate! A voluntary exile with his chieft.

Here England's Genius yet may weep the day, Th' illustrious captive felt her cruel sway; And lingering, oh! with slow consuming pain, Alas! to England an eternal stain!

Farewell, great chieftain! Thy immortal name stands yet unassail'd on the rolls of fame.

He that is without name, without friends, without coin, without country, is still at least a man; and he that has all these is no more.

New Species of Brilliants.

At a ball in Calcutta, a lady, remarkable for the splendor of her dress and ornaments, attracted the eyes of all the company, on entering the ball room. Rows of brilliants, which threw around her a light like that of the fabulous carbuncles of the Arabian Nights, glittered down her dress, and eclipsed all the jewels in the room. When the other ladies, desirous of examining her sumptuous ornaments,

drew near, and began to pry into the mystery, it was discovered that the ingenious fair one had imprisoned some hundreds of fire flies in little bags of muslin, the ventus terribilis of Petronius; and that proud to adorn so much beauty, they fluttered as she moved, and gave her the appearance of being decked out with jewels of living fire.—London Weekly Review.

An Irish gentleman lately fought a duel with his intimate friend, because he jocosely asserted that he was born without a shirt to his back. About as rational as duels in general.

Going down hill.—Mankind often exhibit a propensity to hasten the descent of those who appear to be going down hill, and are always ready to fall upon the fallen. Hence the truth of OVID's comparison, who likens a man of broken fortune to a falling column, the lower it sinks the greater weight it is obliged to sustain.

Deaths from wanting Charcoal.—Two coloured persons, man and wife, by the name of Williams, were found dead in their bed, at the house of a Mr Heath in East-Hartford, on Thursday morning last. Previous to their retiring to bed, they placed a kettle of burning charcoal in the room in which there was no fire-place, which was undoubtedly the cause of their death.

Rules for young Tradesmen and Apprentices.—Be careful not to encumber yourself with a house of greater rent than the current profits of your business will easily pay. Many young beginners have half undone themselves by want of foresight in this one article. Quarter days are clamorous visitants, and their dues must be shed off from the capital stock, if the product does not swell in proportion to the demand. Therefore, before you attempt the dangerous experiment, make the most exact estimate possible, of the expenses you may incur, and the prospects you have to make the balance even; and rather trade within your compass than beyond it; it is easy to enlarge your risk, but not to contract it; and once out of your depth, it is a great hazard, if ever you recover your footing any more.

Intoxication in all liquors.—Brandy kills the soonest; it takes most rapidly to the head, and tinges the face to a crimson or livid hue. Rum is probably the next in point of fatality, and then gin and whiskey. The most dreadful of all liquors is rum when it is not very old. It is such certain death to Europeans in hot climates, that the sale of new rum is prohibited in our southern colonies by the most severe laws. But when a man talks of the effects of brandy, rum, or gin, or indeed of wine of any sort, he is erecting a theory upon a shadow. What ninety nine men in a hundred drink as brandy, is no more that liquor than it is champagne. Most of the brandy drunk in public houses, or bought of inferior retailers, is nothing more than spirits of wine diluted and flavored.—The Hollands sold by publicans, is a mixture of gin and whiskey. As to gin, it is a liquor as different from itself as table beer is different from pure alcohol; much of this liquor is composed of mineral acids, or turpentine, and other rank poisons; if diluted and exposed to the atmosphere, it is covered with putrid film; and one dose to a person, not accustomed to dram-drinking, may occasion death.

ESTABLISHMENT FOR SEEDS.

We have now for sale, at the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—mostly of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed-growers, and to have the seeds perfectly genuine. The following comprises our most prominent kinds:

- Artichoke, Green Globe Cucumbers, 13 varieties, including White and Green Turkeys, &c. &c.
Asparagus, Devonshire Grapes of the Vine, &c. &c.
Lettuce, 12; Plant, Purple and White curled
Large White Reading Endive, Green & White curled
Beans, 25 varieties, including the English broad beans, Garden Bunch, &c.
Early White, &c. &c.
Early Yellow, &c. &c.
Early White, &c. &c.
Early Yellow, &c. &c.
Broad, Early White, &c. &c.
Broad, Early Purple, &c. &c.
Cabbages, 22 varieties, including the Rossian, and common kinds, early and late.
Carrots, Altringham, &c. &c.
Carrots, Orange, &c. &c.
Early White, &c. &c.
Flour, Red (for West India market), &c. &c.
Lima, &c. &c.
Purified (fine sort), &c. &c.
Cauliflower, Early and Late, &c. &c.
Celery, White solid, &c. &c.
Early coloured solid, &c. &c.
Radish, &c. &c.
Lemon, &c. &c.
Water, &c. &c.
Lakewise Excellent Roots and Plants, Field and Grass Seeds, Pot and Sweet Herb Seeds, Medicinal Herb Seeds, Bird Seeds, and more than 200 different kinds of ORNAMENTAL FLOWING SEEDS.

By the variety and quantity of Seeds kept at this Establishment, we are better than at any other place in New England, orders for the British Provinces, the West India market, or the Southern States, can always be executed with promptness, at satisfactory prices. Dealers in Seeds and Country Traders supplied at wholesale or retail on the best terms.

We have now on hand of the year's growth, 200 lbs. Mangel Wurtzel & Sugar Beet, raised by J. Prince, Esq 500 lbs. Onion Seed, Red, White and Yellow. 275 lbs. true Blood Feed, raised in Roxbury 250 lbs. Carrot, various kinds 250 lbs. French, superior quality 200 lbs. English Turnip, raised in Roxbury 100 bushels Peas, early and late.—[We have about 50 bushels of the Early Washington Pea, which was pronounced by the few who could obtain it last year—as our supply was small—the earliest and most productive of any brought into the Boston market.]

Among the new vegetables we have introduced, and which are not common in the Boston market, are the Early Russian Cucumber, (very early) Computed Lettuce, Grass Pea [for water use] Purple Carrot, Giant Asparagus, Lima and Valparaiso Squash, Siberian Parsley, [hardy] Russian Cabbage, Yellow Malta Turnip, Colorado, Finest Family Pumpkin, Lady's Finger Pea [a new and fine marrowed] New Nonpareil Pea, (most numerous, very prolific, and of delicious flavour) New Zealand Spinnaker, and Rotterdam and Bonavia Peas.—[The Bonavia is a new Early Shell Bean, by many considered equal to Lima Peas—and to this good quality may be added the very ornamental appearance which beared by their beautiful white flowers.]

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished at this Establishment with boxes containing a complete assortment of the seeds used in a kitchen garden, on as favourable terms as they can be purchased in this country, neatly done up in small papers, at 6 and 12 cts each—warranted to be of the growth of 1827, and of the purest quality. ON A SPECIAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts.

[For Catalogues of the whole Establishment, with directions for cultivating the more rare and delicate sorts, comprising a pamphlet of 10 pages, finished gratis.]

White Mustard Seed.

For sale at the office of the New England Farmer, the best English White Mustard seed, by the pound or bushel.

[Published every FRIDAY, at Three Dollars per annum, payable at the end of the year; but those who pay within sixty days from the time of subscribing, are entitled to a deduction of Fifty Cents.]

AGRICULTURE.

From the Concord Gazette.

AGRICULTURAL EXPERIMENTS.

The Society of *Abolisher Husbandmen and Manufacturers* have awarded the following premiums for agricultural experiments.

To Mr Joseph BLANCHARD, of Boxborough, for the best cultivated field of Hops, the first premium \$10

Mr Blanchard has instituted a series of experiments on the following subjects:—To ascertain how much the hop plant is capable of producing;—To discover whether luxuriance and fructification can be united;—To ascertain if the same plant may be continued in the same soil without degenerating;—To ascertain whether the soil is rendered sterile or fertile by continual cultivation. His results on these points have been very satisfactory.

The field, the product of which in 1827 has obtained the Society's first premium, was thus cultivated. In November 1826, a compost, being three parts dark coloured loam and one part stable manure, was made, to be used on the hop field.—In the spring as soon as the frost permitted, the hops were dressed by ploughing and opening the hills; the superfluous roots were cut out; and a shovel full of the compost was laid on each hill. The hills were then covered with the mould of the field. Two poles were placed in each hill.—As soon as the plants were grown enough to attach themselves to the poles, the first ploughing and hoeing began, which was repeated on seven successive weeks. At the second and third hoeings the field was manured with compost, which was one half green stable manure, the other half dark coloured loam. This was laid in small quantities in each hill. Nine loads of manure were used to each acre. Cultivation ended between the 10th and 15th of July. The hop picking began Aug. 28, and ended Sept. 12. The field contained four acres and seventy-four rods. This field produced 14340 lbs. of the first quality hops. The average produce to an acre 2317 lbs.; the best acre yielded 3800 lbs. The expense of cultivation to an acre \$157.42; expense to a pound of hops was six cents and eight mills.

To Mr James Mace, of Boxborough, for the next best crop of hops, the second premium, \$5

To Mr Nathaniel Holden of Shirley, for the greatest crop of corn on one acre, the first premium, \$15

The acre produced 102 bushels three pecks, and one quart of shelled corn; each bushel weighing 58 lbs. Mr Holden states that he put twelve loads of barn manure and seventeen loads of rich compost on the acre. The whole was hoed three times; one third of the acre was grass land on the preceding year. The expense of cultivation was only \$27.80.

To Phineas Whiting, Esq. of Lowell, for the next best crop of corn, a premium of \$10

To Mr. Nathan Grout, of Sherburne, for the best crop of barley on an acre, the first premium \$10

This land produced on the preceding year, 40

bushels of corn by the aid of 20 loads of manure. Early in the spring of 1827, it was ploughed and then covered with 8 loads of manure, which was ploughed in; the furrows being 8 inches deep. The land was ploughed a third time by a horse plough, and 52 quarts of barley sowed on the furrows and harrowed in. The barley was harvested in July, and the amount was 54 bushels of well cleaned barley. The quantity of seed was less than is usually sown on an acre, but Mr. Grout thinks the crop would not have been greater if the seed had been increased to the ordinary quantity. The whole expense of cultivation and seed was \$20 61.

LAND IN VIRGINIA.

Mr Randolph, in a late speech, stated the following fact to show the depreciation of property in Virginia. A gentleman purchased a small tract of *fair* land, on which he built a house that cost 5000 dollars. Being obliged to sell a few years after, he sold the land for three dollars an acre, without any allowance for buildings. The purchaser thought he had obtained the property very cheap, but he cannot now get his money back. In the same quarter, land, some of it good wood land, has sold for one dollar per acre.

Hamp. Gazette.

HOPS.

The inspector of hops at Albany reports that he inspected 749 236 pounds of hops during the last year. Most of them were raised in Madison and Oneida counties, but some in Otsego, Saratoga, Genesee, &c. The market has been dull, and the price has not averaged over 9 cents. This is partly attributed to large quantities of hops from Massachusetts, which are preferred to those raised in New York.—*Ibid.*

A FARM IN CHILI.

An American in Chili describes an estate owned by Don Juan Ovalle, about 30 miles from Valparaiso; it is 13 leagues square, (about as extensive as the old county of Hampshire.) Ovalle has upwards of 10,000 head of cattle and an incredible number of horses, which run wild 11 months in the year. Once in a year they are all brought together, branded, such as are wanted taken out, and the rest turned adrift. The branding of one of these wild cattle is performed in two minutes. One man throws a lasso over his head, another has him fast by the hind legs, the animal is cast, and the brand applied.—*Ibid.*

[From the New York Farmer.]

Letter from the Rev. Dr. Miller, to the Secretary of the New York Horticultural Society, on the cultivation of the Strawberry.

PRINCETON, (N. J.) January 30th, 1821.

Dear Sir,—It is a number of months since I received official information, that the "Horticultural Society of New York" had done me the honor to elect me one of its honorary members. For this unexpected and unmerited honor, I beg the Society to accept of my best thanks. I fear that they will find me rather a useless associate; one who has no other claim to their notice than an ardent desire to learn on the subject of gardening, and a

willingness to communicate something, though it be ever so little, to the stock of improvement. It was my intention to acknowledge the favor conferred upon me, several months ago; but I was desirous of having something better to send than a mere letter of thanks. Whether I now attain, in any good measure, my purpose, you will be able hereafter to judge.

I am desirous of communicating to you, and through you to the Society, a supposed improvement in the culture of *strawberries*, which is new to me, and which may be deemed worth an experiment by those who are fond of that delicious fruit. It was communicated to me by a gentleman of great respectability, of Somerset county, in the state of Maryland, who has one of the best gardens I ever saw, and who, particularly, has more strawberry vines growing in it than I ever saw in a private garden before.

This improvement consists in *burning* the vines in the spring of every year. The burning is accomplished in the following manner: early in the spring, as soon as the frost is completely out of the ground, cover the bed nearly an inch thick, with dry wheat straw. Put fire to it at the windward end, and it will immediately and rapidly consume all the dead vines, grass and weeds which are not covered by the earth, without at all injuring the roots of the vines; but rather rendering them more vigorous and fruitful. This ought to be done not in a very windy day, or else the flame will pass over the bed too rapidly, and with too little impression; and yet not in a perfectly calm day, lest the flame should proceed too slowly, and so scorch the tender roots of the vines; but when a gentle breeze is blowing, sufficient to make the combustion prompt and equal, and in such a direction as not to endanger adjacent fences or shrubbery.

After the burning, the vines are to be left as the flame leaves them, for some days. As soon as they begin to shoot, they ought to be dressed, superfluous roots or shoots removed, and the grass and weeds eradicated with a large knife, or some similar garden tool of easy application.

The gentleman to whom I referred above, informs me that he generally burns one third of his vines about the 20th of February; another third from the 1st to the 10th of March; and the remaining third, about the last of March, or the first of April. He supposes, however, considering the difference of climate, that each burning ought to be from ten to twelve days later in Princeton or New York. By adopting this method, he says he secures a *succession of crops*, and the last crop much later, than his neighbors. He adds that he has burned his last parcel of vines as late as when they were beginning to blossom; and not only without any apparent injury, but to their manifest improvement in thrift and productiveness. He thinks, also, that the vines managed in this way, yield their fruit, not only in a more convenient succession, but at least a *third more in quantity* than others, on the same soil.

When this process was first mentioned to me, my mind revolted at it, as destructive rather than useful. But the gentleman who recommended it to me, declared that he had practised it for a number

of years, and always with evident advantage; and I have such entire confidence in the correctness of his representation, that I have resolved to make the experiment, if I am spared to see the ensuing spring, on at least part of my vines. If the advantages of this management are any thing like what is alleged—and I am not at all apprehensive of any deception in the case—it is surely more than worth the trouble. I hope, therefore, that not only you, but also all the other members of your Society, who cultivate this kind of fruit, will embrace the earliest opportunity of putting the proposed improvement to the test.

I had almost forgotten to mention, that the gentleman so often alluded to, informed me that he is in the habit of applying this treatment to young as well as to old vines. He showed me some which he had set out the preceding autumn, and which had never borne fruit. These, he assured me, would be burned as well as the older ones, the next year.

Perhaps, however, all this, though perfectly new to me, is by no means so to you and your worthy Horticultural associates. Perhaps it is even a long since exploded system of culture. If so, I hope you and the other gentlemen will pardon my giving you the trouble of this communication, and believe that I am, with an ardent zeal for promoting the object of your association, your sincere friend and humble servant,

SAMUEL MILLER.

Mr. Michael Floy, Secretary, &c.

From Cobbett's American Gardener.

FLOWERS AND ORNAMENTAL GARDENING

My reason for making *Flowers* a part of my subject, have been stated. However, if the American Farmer has no taste for flowers, his wife and daughters may; and this part of the book can, at any rate, do him no harm.

Under the head of *Flowers* come flowering trees and shrubs; and, therefore, I must, in this place, say a little of these and of ornamental gardening. It is by no means my intention to attempt to give an account of all the flowers that come into the florist's catalogue. That catalogue, with only a very short description of each flower, would fill ten volumes, each surpassing this in bulk. I do not blame the taste of those who study *botany*, and who find pleasure in the possession of *curious* trees and plants; but, all that I shall attempt, is, to speak of those flowers that stand most prominent as to their capacity of making a beautiful show and of sending forth fragrance.

As to the spot for flowers, the smaller kinds, and even small shrubs, such as roses, dwarf honey-suckles, and the like, may be planted by the sides of the broad walks in the kitchen garden, or a little piece of ground may be set apart for the purpose. In cases where there are what are usually called *pleasure grounds*, large shrubs, and, if the grounds be extensive, lofty trees come in.—And, in the placing of the whole of the trees and plants, the most lofty should be farthest from the walk.

As to the manner of sowing, planting, transplanting, and cultivating, what has been said of fruit trees and of garden vegetables and herbs applies here. The ground must be good, well tilled, and kept clean, or the plants and flowers will not be fine.

Before I proceed to the *Alphabetical List*, let me

again observe, that I merely give a *selection*, such as appears to me to be the best calculated for gratifying, at different seasons, the sight, or the smell, or both. That there is a great deal in *rarity* is evident enough; for, while the English think nothing of the *Hawthorn*, the Americans think nothing of the *Arbutus* the *Rhododendron* the *Kalmia* and hundreds of other shrubs, which are amongst the choicest in England. The little dwarf brush stuff, that infests the plains in Long Island under the name of "*Kill-Calf*," is, under a fine *Latin* name, a choice green-house plant in England, selling for a dollar when not bigger than a handful of thyme. Nay, that abominable thing, with a yellow flower, called the "*Plain Weed*," which is the torment of the neighbouring farmer, has been, above all the plants in this world chosen as the most conspicuous ornament of the King of England's grandest palace, that of Hampton Court, where, growing in a rich soil to the height of five or six feet, it, under the name of "*Golden Rod*," it nods over the whole length of the edge of a walk, three quarters of a mile long and perhaps, thirty feet wide, the most magnificent, perhaps in Europe. But, be not too hasty, Americans, in laughing at John Bull's king; for I see as a choice flower in your gardens, that still more pernicious European weed, which the French call the *Coquelicot*, and the English the *Corn-Poppy*, which stifles the barley, the wheat, and especially the peas, and frequently makes the fields the colour of blood.

This is quite sufficient to show the power of *rarity* in affixing value on shrubs and flowers. The finest flowering trees and shrubs in England have been got from America. The *Wild Cherry*, which they call the *bird-cherry*, which here grows sometimes to the height of a hundred feet, and one of which I now see from my window more than seventy feet high; the *Locust*, most beautiful of trees and best of timber; the *Catalpa*, blossoms far more beautiful than those of the horse-chestnut, broad and beautiful leaves that do not scorch in the hottest sun; all the beautifully blowing *Laurel tribe*; the *Rose of Sharon* (as it is called here) and the *Althea Frutex*; the *Azalia* of all colours; *Roses* of several kinds. But, there is one shrub of the larger kind, abundant here, that I never saw there, and that is the thing which some call the *Morning Star*. It has six leaves in its flower, which is in the form of the flower of the *single rose*. The whole flower when open, is about three times the circumference of a dollar. Some of the trees bear blossoms quite white, and others blossoms of a whitish peach blossom colour. These blossoms come the earliest in the spring. They are out full, in Long Island, in the first week in May, which is rather earlier than the peach-blossoms. In England, they would be out full, on an average of years, in the last week of February, which is an anticipation of all their shrubs. The trees, which is a great quality, *thrive well under other trees*, which, indeed, seems to be their nature. You see, from a great distance, their bright and large blossoms, unaccompanied by leaves, shining through the boughs of the other trees;—and some of them reach the height of forty feet. This, therefore, is a very fine flowering tree; and yet I never saw one of the kind in England.—How beautiful a grove might be made of this tree, the wild-cherry, the Locust, the Catalpa, and the *Althea-frutex*! And here they are all, only for the trouble of sowing; for from the seed the tree will surely come.

(To be continued.)

RAIL ROADS.

A writer in the Boston Palladium, who makes *Rail roads* the theme of his essays, has, in our opinion, used one of the best (not, indeed, new) arguments that can be urged for public works of that kind, namely, the increase of trade, amount of travelling, value of lands along the lines, &c. These are, we think, to be preferred to the more direct calculation of per centage on investments. In our opinion, the question is scarcely worth putting, by a State or the nation, when contemplating a great undertaking, whether 1, 2, 3, or 6 per cent is to be received annually, from the cost of the work, by tolls or other direct income.

These are considerations for companies & individuals;—the question for a State is, will the progress of trade be proportionately aided? will that which is liable or likely to be drawn to other markets, be continued to our own? will property experience some considerable accession to its price? on the whole, will the people generally derive an advantage to balance the inconvenience of construction, calculating, if necessary, into the credits of the work, the saving of the trade at risk for want of facilities, as well as direct increased profits? But as to net amount of tolls upon a public Rail road or canal, being more or less than any specified sum, it is unworthy of enquiry. As well might the common council of this city, think of raising a revenue, by collecting tolls for passengers in Market street.—U. S. Gazette.

HYDROPHOBIA.

Thomas L. McKennie, Esq. Superintendent of Indian Affairs, addressed a circular to the Agents of the United States in the Indian country by direction of the Secretary of War, directing them to ascertain the remedies used by the Indians for the bites of mad dogs and snakes. The Superintendent himself endeavored to obtain a knowledge of these remedies, which he believes the Indians possess, while travelling in their country, but did not succeed. A letter from Horatio Jones, the interpreter at Genessee, in answer to the circular, and enclosing a quantity of the seed of a plant referred to in it, has been received. It states that the Indian cure for Hydrophobia is a plant cultivated in the same manner and used by them as a substitute for the tobacco plant. "When a dog is afflicted, it is moistened and tied round his neck, and the dry tobacco put in a pipe and smoked by a person into his nostrils; and in case a person is bitten, he is to be treated in the same manner, excepting binding moistened tobacco on the wound. They never knew persons to be mad, though they have been frequently bitten by mad dogs, because they apply the remedy immediately, which, [they say] stops the effect of poison.—There are old and experienced doctors among the Indian, Tall Chief being fifty-eight years old, and Dr. Monture about fifty-five."

FLEMISH AGRICULTURE.

In 1815 Sir John Sinclair, formerly President of the Board of Agriculture, attracted by the high encomiums which he had heard on the Flemish system, visited the country, and after residing there for some time, so deeply was he impressed with the novel and extraordinary scenes he had witnessed, that he addressed a letter to the editor of the Brussels Observer in which among other expressions of high satisfaction, he remarked: "I shall never forget what I have seen in this country; a picture of the most ravishing descrip-

tion to a lover of agriculture; a soil become rich through the effect of cultivation, and consequently by the skill of an industrious people, who receive the due reward of their admirable exertions, in the product which they obtained."

About fifty years previous to the period of Sir John Sinclair's visits, Flanders was almost a moving snail. With a climate not more favorable than that of England, land has since quadrupled its value; fallows have been entirely banished; the produce in nine years, is generally fifteen harvests, of which wheat yields, on an average, four quarters per acre; barley, seven quarters and a half, and oats eleven and a fourth quarters; and the borders of the fields are planted with trees, in such numbers, that by their sale the proprietors acquire, every forty years a sum of money equal to the value of the soil. The cause of this wonderful improvement and fertility, is chiefly attributed, by Vandertraeten, author of a treatise on Flemish husbandry, to the care taken to "extirpate noxious plants and roots every six or every three years, by digging all the land on their respective farms. By this operation they revert to the surface a stratum of fresh soil, which for three or six years, has been absorbing the salts of manure as they filtered to the bottom of the roots."

Liverwort.—A short time since, we noticed an inquiry in some of the newspapers for information, concerning any practical benefit derived from the use of this celebrated plant. In a late National Intelligencer there is an article signed by a gentleman of Washington, stating that the writer, after undergoing salivation thrice for the cure of an inflammation of the liver, experienced several attacks of bleeding at the lungs, which reduced him to such a state of debility as to induce a belief that his constitution was fast falling a prey to the ravages of pulmonary consumption. In this condition, the patient determined on making trial of the Liverwort, as recommended by Dr. Herford; and for the last three or four months, has persisted in its use with manifest advantage—having derived signal relief from the most painful symptoms of his malady. He states that the discharges of blood have ceased, that his strength has rapidly returned, and that his frame is renovated to a degree far beyond his most sanguine anticipations. He recommends its use also for obstructions of the urinary passages; and exhorts patients, in all cases, while taking the Liverwort tea, to be especially mindful of their regimen:—observing that, for the last sixteen months, he has strictly adhered to a milk diet, and avoided every species of stimulating draughts. He appends the following directions for preparing and taking this medicine: A double handful of the Liverwort, after washing it clean, is to be put in a saucepan, and half a gallon of boiling water poured on the same: let the pan then remain on the hot embers or stove, and simmer for about an hour and a half—then pour the whole into a proper vessel to drink out of. When cold, it may be drank as often as the thirst or state of the stomach will admit. The keeping the leaves in the vessel while using the tea, is necessary, to keep the same limpid.—*Boston Bull.*

Carriage Bodies.—Mr. Jesse Reeder, of Ohio, has patented a new mode of constructing carriage bodies, which is thus described: "The frame or skeleton, is composed of small straight grained

slips or strips of tough white oak, shaved with the grain, about an inch wide, a quarter of an inch thick, steamed for bending into any desired shape, and extended round the bottom and sides of the body, in every direction, like the frame of common basket or ribs of a boat. The top of the body is covered with carpeting, and the outside with canvas, or leather, which, with painting, make the most light, beautiful, and permanent panelling; not hable, like the common wooden panels, to split, and from which a little paint will remove the defacing of a bruise, the only injury to which they would seem exposed. No mortises or tenons are used in any part of the frame, which is so constructed as to brace every part, and to hold itself firmly together by the help of a few rivets or screws. The whole is so completely and firmly interwoven, and presents at every point so strong resistance, that it would rebound like a basket, from the most violent shock or concussion, unbroken, and it would appear impossible to break, rack, or loosen it by upsetting, or any ordinary accident. The frame of a carriage body calculated to hold six persons, built in the above manner, has been found to weigh only twenty-five pounds, less than one quarter of the weight of the common panel body; and when finished, the difference between the weight of the old and new bodies is from $\frac{3}{4}$ to $\frac{1}{2}$ less, or the weight of from two to three persons, in favor of the latter.

From the St. John's Courier.

NORTHUMBERLAND AGRICULTURAL AND EMIGRANT SOCIETY.

At the Annual Meeting of the Members of this Society, this day held at Hamill's Hotel, (Newcastle), pursuant to the rules, the following gentlemen were elected office bearers for the present season, namely,

Thomas H. Peters,—*President.*

James Gilmour, and
Wm. Abrams, Esq's, { *Vice Presidents.*

J. M. Johnson, Esq.—*Treasurer.*

J. A. Street, Esq.—*Secretary.*

Wm. Carman, Jr. Esq.—*Assistant Secretary.*

Committee.

Charles Clarke, Esq.

William Carman, Jr.

Dudley Perley,

Alexander Rankin,

John Fraser,

R. S. Clarke,

A. Frazer, Jr. Esq.

Richard Blackstock,

Isaac Paley,

George Taylor,

Mr. D. Johnson,

James Johnson,

John T. Williston.

The annual subscribers to this Society are not very numerous, although it possesses some very zealous and patriotic supporters, who have not hesitated on all occasions, when the good of the Institution required it, to extend the most liberal assistance. But in the infancy of almost every institution of a public nature, there are always obstacles and prejudices to contend against, which nothing but industry and perseverance, or ocular demonstration of its utility can surmount. The Society, however, I am happy to add, is clear of debt, and upon the whole, is in a prosperous state, and in a fair way of proving highly beneficial to the rural economy and agriculture of the country.

J. A. STREET, *Secretary.*

We observe by the *Miramichi Mercury*, that Mr. ROBERT WASSON, of Ludlow, has reserved

for seed one Hundred Bushels of the "Tea Wheat."—It has been ascertained by experience, (the best evidence in the world,) that this sort of wheat is the best that has yet been used in this Province for the purpose of securing a fair crop. We would earnestly invite the attention of Farmers generally, and of those in particular who have lands fit for raising wheat to avail themselves of the opportunity now afforded them of obtaining at least, a partial supply of this seed.—We would also wish to impress on the minds of persons possessed of this grain, (for there must be others besides Mr. Wasson,) to do every thing within their power either by advertising their stock through the medium of newspapers, or otherwise, for the general good of the inhabitants of the Province. We cannot say that we have *full faith* in the "Tea Wheat" answering the good purposes for which it has been recommended, but we surely think the experiment: that have been made, are sufficient to induce a repetition of them, and that upon as large a scale as possible. If it be finally proved to be not subject to rust, its introduction into this Province is certainly a matter of no ordinary interest.

Ibid.

Leather Bands.—It is somewhat singular that the application of leather bands to communicate motion from one part of machinery to another, should till recently have been so confined in respect to capacity, more especially as their property has been known from time immemorial.

Power to almost any extent may be communicated through them, and to effect this object, it is only necessary to increase their width under a proper tension, proportionately to increment of the power required to be imparted. By adopting bands we get rid of the disagreeable noise which attends the movement of toothed machinery, and also save considerable expense in constructing and repairs.

Messrs. Sellers and Pennock have applied a band of about a foot in breadth to propel a saw of ordinary dimensions for sawing timber, and it answers extremely well.—*Mec. Mag.*

Bill of literary mortality.—Of about one thousand and books published annually in Great Britain, six hundred are accompanied with commercial loss—on two hundred there is no gain—on one hundred the gain is trifling—and, only on one hundred any considerable profit. Six hundred and fifty are forgotten within the year—another hundred in two years—no more than fifty survive seven years—and scarcely ten are thought of after twenty years. Of the fifty thousand books published in the seventeenth century, not more than fifty are now in estimation; and of the eighty thousand books published in the eighteenth century, not more than three thousand are considered worth re-printing—and not more than five hundred are sought after at the present time. Since the first commencement of writing—or in thirty-two centuries—only about five hundred works of writers of all nations have sustained themselves against the devouring influence of time.—*Eng. paper.*

Danville College, Ky.—Four scholarships of \$1000 each are founded. A farm is attached to the College, to reduce by labor the expense of living. The indigent will be supported and educated without charge. Those who are able to board themselves, will pay a sum for that purpose never exceeding \$20 per annum.

ANNUAL CATTLE SHOW.

The Trustees of the Massachusetts Society for the Promotion of Agriculture, encouraged by the patronage of the Legislature of this State, intend to offer in premiums, not only the sum granted by the Government for that purpose, but also the whole amount of the income of their own funds. They therefore announce to the public their intention to have a Cattle Show, and Exhibition of Manufactures, &c. at Brighton, on Wednesday the 13th of October 1828.—The following are the premiums offered:

FOR STOCK.		
For the best Bull, raised in Massachusetts, above one year old		\$30
For the next best, do. do.		20
For the next best, do. do.		10
For the best Bull Calf, from five to twelve months old		15
For the next best, do. do.		10
For the next best, do. do.		5
For the best Cow, not less than 3 years old		20
For the next best, do. do.		15
For the next best, do. do.		10
For the best Heifer [having had a calf]		15
For the next best, do. do.		10
For the best Heifer [not having had a calf]		12
For the next best, do. do.		10
For the next best, do. do.		8
For the next best, do. do.		6
For the best Ox, fitted for slaughter, regard to be had to, and a particular statement to be given of, the mode and expense of fattening		25
For the next best, do. do.		20
For the next best, do. do.		10
For the best pair of Working Oxen.		25
For the next best, do. do.		20
For the next best, do. do.		15
For the next best, do. do.		12
For the next best, do. do.		8
[No oxen to be admitted to trial as working oxen, under four years old.]		
For the best Merino Ram		15
For the best, do.		10
For the best Merino Ewes, not less than five in number		20
For the next best, do.		10
For the best Bear, not exceeding two years old, to be kept at least 1 year for breeding		12
For the next best, do. do.		8
For the next best, do. do.		5
For the best Sow, to be kept at least 1 year for breeding		12
For the next best, do.		8
For the next best, do.		5
For the best Pigs, not less than two in number, nor less than 4 months old, nor more than eight		10
For the next best, do.		5
None of the above animals will be entitled to premiums, unless they are wholly bred in the State of Massachusetts.		
Any of the above Stock, when raised and still owned at the time of the exhibition by the person who raised them, will entitle the claimant to an allowance of ten per cent. in addition. But Sheep, to be entitled to any of the above premiums, must be raised by the person entering them.		
NEW PREMIUMS FOR SHEEP.		
For the best Dishley or New Leicester Ram	\$15	
For the best, do. Ewe	15	
For the best South Down Ram	15	
For the best, do. Ewe	15	

The above four premiums will be awarded on Sheep either imported or raised in the State. The persons claiming these premiums to engage to keep the imported animals within the State. No animal, for which to any owner one premium shall have been awarded, shall be considered a subject for any future premium of the Society, except it be for an entirely distinct premium, and for qualities different from those for which the former premium was awarded. Any animal which shall have obtained a premium as a Milk Heifer shall not afterwards be entered for premium as a Milk Cow.

FOR GRAIN AND VEGETABLE CROPS.

To the person who shall raise the greatest quantity of Indian Corn on an acre, not less than 100 bushels - \$20
 To the person who shall raise the greatest quantity of vegetables, [grain, peas, and beans excepted]—for winter consumption, of the stock of his own farm, and not for sale, in proportion to the size of the farm and stock kept, having regard to the respective value of said vegetables as food, stating the expense of raising the same, and the best mode of preserving the same through the winter - 20
 To the person who shall raise the greatest quantity of Winter Wheat on an acre, not less than 30 bushels - 20
 To the person who shall raise the greatest quantity of Spring Wheat on an acre, not less than 30 bushels - 20
 To the person who shall raise the greatest quantity of Barley on an acre, not less than 45 bushels - 20
 To the person who shall raise the greatest quantity of Rye on an acre, not less than 30 bushels - 20
 To the person who shall raise the greatest crop of Millet on an acre, cut and cured for hay, not less than three tons, the claimant giving evidence of the time of sowing, the quantity of seed sown, and the quantity of hay produced - 20
 To the person who shall raise the greatest quantity of Carrots on an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest quantity of Potatoes on an acre, not less than 500 bushels - 20
 To the person who shall raise the greatest quantity of common Beets on an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest quantity of Parsnips on an acre, not less than 100 bushels - 20
 To the person who shall raise the greatest quantity of Mangal Wurtzel on an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest quantity of Ruta Baga on an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest quantity of Turnips on an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest quantity of Onionson an acre, not less than 600 bushels - 20
 To the person who shall raise the greatest

quantity of Cabbages on an acre, not less than 25 tons' weight, free from earth when weighed - 20
 To the person who shall raise the greatest quantity of dry Peas on an acre, not less than 30 bushels - 20
 To the person who shall raise the greatest quantity of dry Beans on an acre, not less than 30 bushels - 20
 To the person who shall give proof of having produced the largest quantity of dressed Flax, raised on half an acre, and not less than 250 pounds - 20
 To entitle himself to either of the premiums for Grain or Vegetable crops, the person claiming, must cultivate a tract of at least one acre in one piece, with the plant or production for which he claims a premium, and must state in writing under oath of himself, and one other person [accompanied by a certificate of the measurement of the land by some sworn surveyor,] the following particulars:—
 1. The state and quality of the land, in the spring of 1828.
 2. The product and general state of cultivation and quality of manure employed on it the year preceding.
 3. The quantity of manure used the present season.
 4. The quantity of seed used, and if Potatoes, the sort.
 5. The time and manner of sowing, weeding, and harvesting the crop, and the amount of the product, ascertained by actual measurement, after the whole produce, for which a premium is claimed, is harvested, and the entire expense of cultivation.
 6. In regard to Indian Corn, the entire crop of the acre offered for premium, if shelled, must be measured between the 15th Nov. and 1st December. If not shelled, the whole must be weighed within the same dates—and the Trustees have determined to consider 75 pounds of Corn and Cob as equivalent to one bushel of shelled Corn.
 And in relation to all vegetables, [except Potatoes, Onions, and common Turnips] at least 40 bushels must be weighed, and 50 pounds will be considered as equal to one bushel, free from dirt.

AGRICULTURAL EXPERIMENTS.

For a mode of extirpating the Worm that attacks the Locust Tree, which shall appear to the satisfaction of the Trustees to be effectual. - \$100
 For a mode, hitherto unknown, to extirpate the Borer that attacks the Apple Tree, which shall appear to the satisfaction of the Trustees to be effectual and cheaper than any mode now in use. - 50
 For an effectual and satisfactory mode of destroying the Bee Moth, or of preventing its ravages - 20
 To the person who shall make the experiment of turning in green crops as a manure, on a tract not less than one acre, and prove its utility and cheapness, giving a particular account of the process and its result. - 20
 To the person who shall prove to the satisfaction of the Trustees, that his mode of rearing, feeding, and fattening neat cattle, is best - 20

To the person who shall prove to the satisfaction of the Trustees, the utility and comparative value of the cobs of Indian Corn, when used with or without the grain itself, ground or broken

The claim under the two last heads, together with the evidences of the actual product, must be delivered, free of expense, to Benjamin Guild, Esq [in Boston] Assistant Recording Secretary of this Society, on or before the 1st day of December next;—the Trustees not intending to decide upon claims under the head of Agricultural Experiments, until their meeting in December.

BUTTER, CHEESE, CIDER, CURRANT WINE.

- For the best Cheese not less than one year old, and not less in quantity than 100 lbs. \$10
- For the next best do. do. 5
- For the next best Cheese less than one year old 10
- For the next best, do. do. 15
- For the best Butter, not less than fifty lbs. 15
- For the next best, do. do. 7
- For the next best, do. do. 5
- For the next best, do. do. 5

For the greatest quantity of Butter and Cheese, made between the 15th of May, and the 1st of Oct. from not less than four Cows, the quantity of Butter and Cheese, and the number of Cows, to be taken into consideration, and specimens to be exhibited at the Show, of not less than 20 lbs. of each, and the mode of feeding, if any thing besides pasture was used

For the best specimen of Cider, not less than one barrel, made in 1897, manufactured by the person who shall exhibit the same, and from apples grown on his own farm

For the next best barrel, 10
The person obtaining the first premium shall be entitled to a further sum of \$5, as a compensation for the premium barrel of cider, which will be retained and used at the Show Dinner, in order that he may have the credit of it. [These premiums will be continued in future years. Persons claiming them must state, in writing, their process of making and managing their cider, and the kind of apples used.]

FOR INVENTIONS.

To the person who shall use the Drill Plough or Machine and apply it most successfully to the cultivation of any small grains or seeds, on a scale of not less than one acre

To the person who shall invent the best machine for pulverizing and grinding plaster to the fineness of 25 bushels per ton, and which shall require no more power than a pair of oxen or a horse, to turn out two tons per day, and so portable that it can be moved from one farm to another without inconvenience

To the person who shall produce at the Show any other agricultural implement, of his own invention, which shall, in the opinion of the Trustees, deserve a reward, a premium not exceeding Twenty Dollars—according to the value of the article exhibited.

In all cases, proofs must be given of the work done by the Machine, before it is exhibited;—and of its having been used and approved by some practical farmer.

Persons who have taken out patents for their inventions are not thereby excluded from claiming any of the above premiums. No claimant will be entitled to a premium, unless, in the opinion of the Committee, the machine or implement presented by him shall be superior to any designed for the same use, which shall have heretofore gained a premium.

FOR RAISING TREES AND HEDGES.

To the person who shall, on or before the 1st day of Dec. 1830, produce proofs of having raised the greatest amount in value of Mulberry Plants, either in standards, dwarfs or in hedges, for the purpose of raising the Silk Worm, and shall exhibit not less than 5 pounds of unmanufactured or raw silk, of his own production \$100

For the best Plantation of White Oak trees, not less than one acre, nor fewer than 1000 trees per acre, to be raised from the acorn, not less than 3 years old—and which trees shall be in the best thriving state on the 1st of September 1828 100

For the best plantations of White Ash, Larch or Locust trees, each of not less than 1 acre, nor fewer than 1000 trees per acre, to be raised from the seeds, and which trees, not less than 3 years old, shall be in the best thriving state, on the 1st September, 1828 50

For the best Live Hedge, made either of White or Coespur Thorn, planted after 1820, not less than 100 rods, and which shall be in the best thriving state in 1828 50

For the best Buckthorn Hedge, not less than 100 rods, and which shall be in the best thriving state in 1829 50

To the person who shall have planted out on his farm since the spring of 1819, the best apple orchard, of not less than 100 trees, and who shall exhibit to the Trustees at the Show in 1828 satisfactory evidence of his having managed the same with care and skill 50

FOR DOMESTIC MANUFACTURES.

To the person or Corporation who shall produce the best specimen of fine Broadcloth, not less than 1½ yards wide, exclusive of the list, 40 yards in quantity, and diend the wool \$20

- For the second best, do. do. 15
- For the best superfine Cassimere, not less than ¾ yard wide, nor less than forty yards in quantity 12
- For the second best, do. do. do. 8
- For the best superfine Satinet, ¾ yd wide, not less than 50 yds. 8
- For the second best, do. do. do. 5

FOR HOUSEHOLD MANUFACTURES.

- For the best Woollen Cloth, ¾ yd. wide, not less than 20 yds. in quantity 12
- For the second best do. do. do. 8
- For the best double milled Kersey, ¾ yard wide, not less than 20 yards in quantity 12
- For the second best do. do. do. 8
- For the best Coating, ¾ yd. wide, not less than 20 yds in quantity 8
- For the second best do. do. do. 6
- For the best Flannel ¾ yd. wide, not less than 45 yds in quantity 10
- For the second best do. do. do. 7

- For the best yd. wide Carpeting, not less than 30 yds. in quantity 15
 - For the second best do. do. do. 7
 - For the best ¾ yd. wide Stur Carpeting, not less than 30 yds. in quantity 10
 - For the second best do. do. do. 7
 - For the best pair of Blankets, not less than ¾ wide and 10-4 long 6
 - For the second best do. do. do. 4
 - For the best Woollen knit Hose, not less than 12 pair in number 5
 - For the second best do. do. do. 3
 - For the best Worsted Hose, not less than 12 pair in number 5
 - For the second best do. do. do. 3
 - For the best Men's Half Hose [woollen] not less than 12 pair in number 4
 - For the second best do. do. do. 2
 - For the best Men's Woollen Gloves, not less than 12 pair in number. 5
 - For the second best do. do. do. 3
 - For the best Linen Diaper, 5/8 yard wide, not less than 30 yds. in quantity 3
 - For the second best do. do. do. 3
 - For the best yard wide Diaper [for table linen] not less than 10 yards in quantity 10
 - For the second best do. do. do. 5
 - For the best specimen of Sewing Silk, raised and spun in this State, of good fast colors, not less than one pound 5
 - For the second best do. do. do. 3
 - For the best Linen Cloth, [for shirting or sheeting] one yard wide, and 25 yards long 8
 - For the second best do. do. do. 4
- To the person who shall produce the best specimen of any Cotton Fabrics, manufactured in private families, not less than 5 pieces 20
- All of the above manufactures must be manufactured within the State of Massachusetts. And all manufactures, when presented, must have a private mark, and any public or known mark must be completely concealed, so as not to be seen or known by the Committee, nor must the Proprietors be present when they are examined—in default of either of these requisitions, the articles will not be deemed entitled to a consideration or premium.

Animals, or manufactured articles, may be offered for a premium at Brighton, notwithstanding they may have received a premium from a County Agricultural Society.

It is understood, that whenever, merely from want of competition, any of the claimants may be considered entitled to the premium, under a literal construction; yet if, in the opinion of the Judges, the object so offered, is not deserving of any reward, the Judges shall have a right to reject such claims. Persons to whom premiums shall be awarded, may, at their option, have an article of plate with suitable inscriptions, in lieu of money. Premiums will be paid within ten days, after they shall be awarded.

That in any case in which a pecuniary premium is offered, the Trustees may, having regard to the circumstances of the competitor award either one of the Society's gold or silver medals in lieu of the pecuniary premium annexed to the several articles.

That if any competitor for any of the Society's premiums shall be discovered to have used any disingenuous measures, by which the objects of the Society have been defeated, such person shall not only forfeit the premium which may have been

awarded to him, but be rendered incapable of being ever after a competitor for any of the Society's premiums.

All premiums not demanded within six months after they shall have been awarded, shall be deemed as having been generously given to aid the funds of the Society.

PLOUGHING MATCH.

On the 15th day of October, premiums will be given to the owners and ploughmen of the three Ploughs, drawn by two yoke oxen, and to the owners and ploughmen of three ploughs drawn by one yoke of oxen, which shall be adjudged by a competent Committee, to have performed the *best work with the least expense of labor*, not exceeding half an acre to each plough. And that entries may be made of the names of the competitors until the morning of the 15th. Preference will be given to those who enter first—but if, on calling the list at the hour appointed, precisely, those first named do not appear, the next in order will be preferred. There will be two Committees of three persons each, one to be the judge of the ploughing by double teams, the other of the ploughing by single teams; the latter to have assigned to them a part of the field distinct from that of the double teams.

Premiums as follows, [being the same for the double and single teams:—]

First Plough	\$15
Ploughman	8
Driver	4
Second Plough	10
Ploughman	5
Driver	3
Third Plough	6
Ploughman	3
Driver	2

In each case, if there be no driver, both sums to be awarded to the ploughman.

The persons intending to contend for these Prizes, must give notice in writing to J. Winship, Esq. of Brighton. The competitors will also be considered as agreeing to follow such rules and regulations as may be adopted by the Committees on the subject. The ploughs to be ready to start at 9 o'clock, A. M.

All persons having articles or animals to offer at the Show, will please take notice, that such alterations have been made in the arrangements, as to bring the whole into *one day*—therefore.

All manufactures and implements must be brought to the Hall, and entered on Monday the 13th, to be examined on Tuesday the 14th.

Also, Butter, Cheese, Cider, &c. on the same day, for entry and examination.

All entries of animals for the pens, or as working cattle, must be made and entered before Tuesday evening the 14th, so as to be arranged by nine o'clock in the morning of Wednesday the 15th for public examination.

The Ploughing Matches will commence on Wednesday morning, at half past 9 o'clock *precisely*.

Trial of Working Oxen at eleven o'clock *precisely*.

The public Sales of Manufactures and Animals at 12 o'clock.

The applicants will be held to a rigid compliance with this rule relative to entries as well as the other rules prescribed.

Besides such animals as may have been offered

for Premiums, any others that are considered by them as possessing fine qualities will be admitted for sale. And for all Animals or Manufactures, that are intended to be sold, notice must be given to the Secretary, before 10 o'clock of the 15th. Auctioneers will be provided by the Trustees.

By order of the Trustees.

February, 1828.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 15, 1828.

FOR THE NEW ENGLAND FARMER.

SWAMP MUCK AS A MANURE.

MR FESSENDEN—In your last publication, a correspondent in New York state, requests some information respecting the use of *swamp muck* as a manure, &c. from some farmer who has been in the habit of making use of the same; in compliance with his wishes, and pleased with the idea that the notions of we yankees should be enquired after by our neighbors of the great State, I inform you that for many years I have used *meadow mud* and *peat mud*, to fill up my barn yard and my hog's styes; that mud is black on the surface of the meadow about three or four feet deep, more or less, with an under layer of a brown colour, about the same thickness, down to the hard pan, exhibiting the undigested remains of some coarse grass, the upper layer is reckoned to be the best quality. We dig clear down, and fill the yard with it, dropping one cart load close to another, so that after it has got settled and upon a level, it lays about one foot and a half all over the yard. This is done in September or beginning of October, improving a dry spell, when alone the work can be performed.

This done we let the mud lay in the yard until the return of the following fall, and whilst it remains there it is often ploughed and harrowed, so as to lay it open to the benefit of the atmosphere, this cannot be done too often, and if the harrow does not break the lumps sufficiently fine, the hoe must be used; it is then carted away to the land which is to require it the following season, and made up in heaps with alternate layers of hog sty mud, summer cattle manure, &c.

In April as soon as the weather becomes genial and warm, these heaps are shovelled over fine, breaking the lumps carefully, and mixing with the mud, as it is shovelled over, unleached ashes, slacked lime if we have any, and as great a proportion of the winter horse manure as can be spared; this last ingredient in the course of eight or ten days will generate in the heaps the gentle heat of fermentation; the compost is then ready for use and good, and I have found it to answer a valuable purpose for raising a good crop of corn, also of barley, I have used it to a very good purpose to raise ruta baga. Grass seed I sow early in the fall after a crop of barley, or of oats mowed for fodder, ploughing the stubble in as soon after mowing as possible, I then let it lay three weeks to give a chance to the stubble to rot, then sow the seed on the furrow, harrow and roll.

Mud, used in this manner, is a valuable article on warm, loamy land; but it is indispensable to bring it to a fermentation, as above described, be-

fore it is used; it develops its powers and brings them into action; in its natural state I conceive it to be inert and of little value.

LONG RED POTATOES.

Your correspondent inquires after the most valuable kind of potatoes to raise for cattle; I believe that the general opinion among us, is, that the best kind for that purpose is the *long red* potato, and I have myself no doubt about it; however, it requires early planting, because it takes a longer season, than any other, to come to maturity. I would say that it ought to be planted as soon as it is likely to be safe against frost; it will give then by far a greater yield than any other kind, and the quality will entitle it to the first rank; the watery ends of that kind of potatoes complained of by some consumers, are the result of late planting; the autumnal frost, in such cases, catches the field whilst the vines are yet green and full of life, and the potatoes immature; but if planted very early the vines have time to decay before the frost comes, and they will be found of an excellent quality.

RUTA BAGA.

Respecting Ruta Baga, I have found it a very useful root, cattle are extremely fond of it, and they will keep in a dry cellar as easy and as long as potatoes do, they may be heaped up there, and I have taken them out in June as hard and as sound as they were when put in; I have found the leaves to be valuable towards the end of summer when the pastures become dry and barren; they may be pulled off as soon as the stalks of the first leaves get yellow, and come off easy, and are invaluable at that time for milk cows; with a piece proportioned to the number of cows kept, by the time that the first leaves were gathered, the second would get yellow and ready to be pulled, and so in succession until frost comes, and it is time to gather in the roots.

MANGEL WURTZEL.

Mangel Wurtzel is a very valuable and excellent root, but it is much exposed here to be cut off, when quite young, by the grey worms; I have been disappointed in that way of a crop several times, and have discontinued, on that account, to sow them. Mangel wurtzel is a milder and sweeter root, better adapted for milk cows than Ruta Baga, which is apt to flavor the milk, but mangel wurtzel requires richer land, and it will not keep so well in the cellar in a heap, being apt to decay.

FALL SOWING OF GRASS SEEDS.

Having alluded above to the fall sowing of grass seeds, I must say further that dear bought experience has taught me the inefficacy to sow them in spring with grain; it was a custom imported with the ancestors of the country from old England, where the cloudy summers and moist climate will warrant a practice, which, under our clear sky and powerful sun is altogether unsuitable. I must add that grass sowed in fall improperly requires to be rolled in spring as soon as the ground is in fit order, otherwise the young plants slightly rooted yet, and heaved up by the frost, will suffer much, perhaps to total destruction; and truly among the many uses to which the roller may be applied, none perhaps would be more valuable than to roll all grass lands in spring; heaved up by the winter frost, and left with the roots partly up from the ground. The plants suffer from the wind and from the heat.

and this being the case more or less every spring, it must necessarily bring on a premature decay, which the yearly use of the roller, at that season, might prevent. With much esteem,
Weston, Feb. 12, 1828. J. M. G.

PROFITABLE DAIRYING.

MR FESSENDEN.—In conformity to advice of friends I transmit an account of the produce of four cows in 1827. One of these four produced about one third of the whole; two are small, aged three years, and one fourteen years. We sold three calves, which were calved the 4th and 10th of March, and killed one for family use—gave one and a half bushels of corn meal to three cows whose calves were for sale, as they did not yield milk enough for their calves by hay alone.

In August and October we sold 755 lbs. new milk cheese; in December and January 291 lbs. do. at eight cents per lb.; 144½ lbs. skim cheese, and four meal, averaging more than two and a half cents per lb.; 177 lbs. butter of different prices, averaging 18 cents nearly; and on hand for family use 61 lbs. new milk cheese; and now making butter in advance of family demand. Butter \$31.70; cheese, new milk \$2.88; skim \$3.88; calves 12, total \$130.40. This is not so much as the butter and cheese sold for in market, but more than \$92.61 per head is what we receive in hand; the family for the largest half of the time consisted of three; and hired men by day's work, have been supplied out of the dairy, exclusive of this above. Two new milk cheeses 24 lbs., one skim 12 lbs., and 4 lbs. butter, were disposed without price. Three rennet skins were returned; these with whey of cheese and butter might be placed to the credit of cows, but are not reckoned.

Between grass and hay in autumn eight bushels of oats were given; in September the under leaves of 300 cabbages, and 1½ bushel of carrots.

These statements are facts that can be proved by store keepers, neighbors and friends, without any exaggeration. When the cows are put to hay, and turned out for drinking, I go with them, drive them back and shut them in the barn yard, or if cold and windy, in the barn; towards night they are sent again and accompanied; by this assistance they drink twice heartily, or once without it. Summer pasture was less than 12 acres without any change except the highway; the verdure, quality and quantity of grass upon my verdant and watered soil, was such that cheeses made in September were not much inferior to those in size made in June—the milk was richer. Milking was all done by the mistress, who draws expeditiously and leaves none.

For good butter in cold weather she keeps the milk warm by a furnace, taking off all the cream in 24 hours; churning every seventh or eighth day; beginning to churn when cream is as much warmer than spring water as it is colder than milk when drawn from cows, increasing temperature or heat, so that when we have butter, the whey and butter are nearly or quite as warm as milk direct from cows. With this management butter is obtained quick and is of a good quality.

Yours, &c.

SAMUEL DENNY.

Oakham, Feb. 13, 1828.

P. S. Wood ashes I mix with salt for cows and horses, beginning with a small proportion of ashes, and increase. One cow is so greedy for salt as to take three parts ashes to one of salt.

Coal.—A coal mine of the bituminous species, which is said to be very extensive, and probably inexhaustible, has been recently opened in Pennsylvania. It is situated on Lyncoming Creek which empties into one of the western branches of the Susquehanna. A small quantity has been got out the past autumn, which on trial, is considered not inferior to the best Liverpool. The distance of the mine from navigable water, is about one mile and a half—it is estimated that the coal can be afforded in New York at a price not exceeding six dollars the chaldron, which is about half the price of Liverpool coal, as quoted in the New York price currents.—Conn. Cour.

Newport.—We rejoice to learn that a spirit of enterprise is beginning to show itself among us. We have been informed, that a number of our citizens, gentlemen of character and property are about to engage in establishing Cotton Factories at this place, to be propelled by steam. Nothing but a determined spirit, and persevering industry, is necessary to build up the town, to a degree of independency equal to any of our neighboring towns. We hope the true interest of Newport will be cherished by those who have it in their power to set the wheels in motion.—Rhode Is. Repub.

Public Schools in Rhode Island.—At the late session of the Legislature of Rhode Island, a law was passed appropriating \$100,000 to the support of schools, to be expended between the towns, according to the number of children in each under sixteen years of age. It is found that the number of children is 35,205. A statement of the apportionment to each town is given in the Newport Republican.

Butter.—Beckman supposes that the ancients were not acquainted with butter in a solid state, as it appears on our tables. Ancient writers always speak of it as something fluid. "The moderns cut, knead, and spread butter; the ancients poured it out like oil."—See Job, xx, 17, and xxix. 6.

Cotton of the first quality has been raised by John Smith, of Belmont county, Ohio, during the last season, and it is thought that its cultivation will one day be as common as that of tobacco. A few years ago the cultivation of tobacco was introduced there, and now vast quantities are raised.

The expenditures of Mr. Prince, of West Island, incident to the culture, and extension of his Horticultural establishment, executed, for the last year, we have understood, the sum of \$13,500.—American Farmer.

Continental Money.—By a Report made to Congress, it appears that the quantity of specie in the hands of the Bank, omitted from 1775 to 1789, amounted to 241,523,750 dollars.

Wool.—Upwards of 6,000 head of cattle have been killed at two short-horned harness farms in Troy the past season, making more than 100,000 barrels of beef.

EARLY CORN.

For sale at the Seed Establishment at the New England Farmer's Office, a few hundred Ears of the *Early Golden Snow* Corn. This Corn was originally raised from the Sioux tribe of Indians and is considered by Mr. Prince, Mr. Derby, and other gentlemen, who have tried it, to be the most profitable sort that can be raised by farmers, from its great productiveness, and from its ripening so early, as always to ensure a crop before the autumn frosts set in. Mr. Prince usually has the new Corn fit for sowing by the first of second weeks in August. The Corn is a bright yellow, the Ears being closely filled with from 12 to 16 rows.

Also—The Early Jefferson Corn; a very early White sort, for the table—with the common kinds of early and late Sweet Corn.

Also, every variety of Garden Seeds for hot beds, &c.—Winter Crook Neck Squash, Early Yellow Bush Squash, Early Scallop or Puttun white Bush Squash, Warred Squash, Acorn Squash, Valparaiso Squash, &c. &c.

Also a few pounds genuine Rata Baga Seed—This Seed was raised by T. Melville, Jr. Esq. late President of the Berkshire Agricultural Society, and is from superior roots, received by him from Russia a few years since.

OATMEAL, HULLED OATS, BARLEY, &c.

The Proprietor of the SEED ESTABLISHMENT connected with the New England Farmer office, has been appointed Agent for the sale of STEVEN'S Oatmeal, Hulled Oats, Hulled or Scotch Barley, Groats, and Pearl Barley, in any quantity from a half barrel to a ton. Mr STEVEN'S reputation for managing these articles is well known and established in the Southern States, he having supplied a large part of that sold in the New York, Philadelphia, and Charleston markets for many years. None but the best of grain is used. An account of the Hulled Oats will be found in a letter addressed to Mr. QUINCY in last week's New England Farmer. A small quantity will be sent gratis to any gentleman disposed to give it a trial. Orders for any quantity of these articles, (which are warranted to be fresh, and packed in sweet casks) addressed to "John B. Russell, Proprietor of the Seed Establishment, No. 52 North Market Street, Boston," will be executed with promptness, at the manufacturer's prices, which are moderate, and will be invariable.

FAMAMIFICATION—Sportsmen and Country Traders will find a constant supply of Powder—Shot—Balls—Percussion Caps, &c. of the best quality, and at the lowest prices, at the *Dip. & Co. Powder Store*, No. 65 Broad-st. E. COPELAND, Jr. Feb. 13.

Landreth's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Tulbous Roots, and Garden Secs. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different Varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants most of which are calculated for adorning in the winter seasons, parlors, sitting-rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the portion of ground allotted to Garden Secs are grown almost every variety of Excellent Vegetables for eating. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The separation of those kinds liable to mix in seeding—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance unembarrassed by any other engagements, to obtain the choicest and most important, and available in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Colman, No. 31 Congress-St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 13. D. & C. L. BRETHER.

MISCELLANIES.

EDUCATION.

By J. Bouring.

A child is born—Now take the germ and make it
A bud of moral beauty. Let the dews
Of knowledge, and the light of virtue, wake it
In richest language and in purest lines;
When passion's gust and sorrow's tempest shake it,
The shelter of affection ne'er refuse,
For soon the gathering hand of death will break it,
From its weak stem of life, and it shall lose
All power to charm; but the lovely flower
Hath swelled one pleasure, or subdued one pain.
O who shall say that it hath lived in vain,
However fugitive its breathing hour?
For virtue leaves its sweets wherever tasted,
And scattered truth is never, never wasted.

Morals.—It is stated in a letter from Holland that last year, in a population of upwards of six millions, there were not two executions.

A man in Charleston advertises 20 anchors of peach brandy. Brandy is an anchor that has brought so many to their meetings, that a burying place might well be called an anchoring ground.

Qualifications for Congress.—"Why do you not present yourself as a candidate for Congress?" said a lady the other day to her husband, who was confined to his chair by the gout. "Why should I my dear?" replied he, "I am not qualified for the station." "Nay, but I think you are," returned the wife, "your language and actions are parliamentary. When bills are presented, for instance, you either order them to be laid on the table, or make a motion to rise, though often out of order, you are still supported by the chair; and you often poke your nose into measures which are calculated to destroy the constitution."

PHILOSOPHY.

To pass our time in the study of the sciences, in learning what others have discovered, and extending the bounds of human knowledge, has, in all ages, been reckoned the most dignified and happy of human occupations; and the name of Philosopher, or Lover of Wisdom, is given to those who lead such a life. But it is by no means necessary that a man should do nothing else than study known truths, and explore new in order to earn this high title. Some of the greatest philosophers in all ages have been engaged in the pursuits of active life; and an assiduous devotion of the bulk of our time to the work which our condition requires, is an important duty, and indicates the possession of practical wisdom. This, however, does by no means hinder us from applying the rest of our time, beside what nature requires for meals and rest, in the study of science; and he who, in whatever station his lot may be cast, works his day's work, and improves his mind in the evening, as well as he who placed above necessity, prefers the refined and elevating pleasures of knowledge to the low gratification of the senses, richly deserves the name of a True Philosopher.

REGULARITY OF LORD COKE.

The following is extracted from a letter from Mr Meade, to Sir Martin Stuteville, published in *Orinda's* Letters, illustrative of English History, &c. By Henry Ellis, P. R. S. &c.

"Sir Edward Coke being now very infirm in body, a friend of his sent him two or three Doctors to regulate his health; whom he told that he had never taken physick since he was born, and would not now begin; and that he had now upon him a disease, which all the drugges of Asia, the gold of Africa, the silver of America, nor all the Doctors of Europe could cure, and AGE. He therefore both thank them and his friend that sent them, and dismiss them nobly with a reward of twenty pieces to each man."

FARM BUILDINGS.

Liberality in providing good barns and warm shelter, is the source of health, strength and comfort to animals; causes them to thrive on less food, and secures from damage all sorts of crops.

Historical Facts.—Vasco de Gama, employed by the king of Portugal, first doubled the Cape of Good Hope, in Nov. 1497, which opened a passage to the East Indies.

Twenty-three years after the first discovery of America by Columbus, Magellan, a native of Portugal, in the service of Spain, penetrated into the Pacific Ocean, by the strait which bears his name. He advanced through the south seas to the Ladrone islands, of which he took possession in the name of Charles V.—He was here slain in 1520, either by the natives or as some accounts say, by his own rebellious crew.

Newfoundland was discovered 21th June, 1497, by the Cabots, who were commissioned to sail in quest of new countries by Henry VII.

In the years 1568-7-8 the coast of Labrador was explored by Martin Probisher, under the auspices of Elizabeth of England. About the same time Sir Francis Drake accomplished his celebrated voyage around the world.

Sir Walter Raleigh fitted out an expedition of two small vessels, in 1584, which reached the coast of North Carolina on the 4th July.—A favorable report of the country, to which he gave the name of Virginia, led to two succeeding expeditions and attempts at settlement, in 1585 and '86, both of which failed; the remnant of the first returned to England, the others perished by famine and at the hands of the natives.

The first restorers of learning in Europe were the Arabians, who in the course of their Asiatic conquests, became acquainted with some of the Greek authors, procured copies of the ancients, and had them carefully translated into Arabic.—The Western Kingdoms of Europe became first acquainted with the learning of the ancients through the medium of these translations. The Arabians disseminated their knowledge in the course of their conquests, and founded schools and colleges in all the countries they subdued.

The boldest naval enterprise of the ancients was the Periplus of Hanno; who sailed from Carthage to the coast of Guinea, within four or five degrees of the equator, in 570. They did not know that Africa was almost circumnavigable.

SMOKEY CHIMNEYS.

There is a way of building a chimney, which was found to succeed in the huts which were erected by the British army in this country during the war of the revolution; and even in the underground chimneys which were built to their tents when out at a late period in autumn or rather the beginning of winter. In the writer's own house, where the principal chimneys were altered

on this plan, after the house was finished, and in which there have been fires for nine months, the purity and cleanliness of the rooms sufficiently testify its efficacy; but he has a still farther proof in the testimony borne by the person who built the house and made the alterations, and who was so convinced of the improvement effected from what he saw, while the chimnies were daup, that in two houses which he has since built in Melville-street, Edinburgh, he has constructed all the chimnies on the same principle. The method is simply to contract the chimney as soon as possible; then gradually to widen it for four or five feet, and then again contract it to the usual dimensions, and carry it up in any direction.

One hour a day.—Spending one hour more in bed, seems, at the time, but a small matter, and so it may be—yet in the course of a year it makes a material difference. The person who rises at 5 o'clock, will have 365 hours more in a year than the one who sleeps till six. This is equal to five weeks' pure daylight, [allowing 12 hours per day] so that his year will number 13 months. Is not this too great of a morning nap, which makes us feel "nothing better but rather worse?" Where-as, if we can summon sufficient strength of mind for the first effort, the deed is done—the hour gained—conscience satisfied—and, business will go better all day.

Lotteries.—A powerful memorial has been read in the Pennsylvania Legislature, against the sanction of Lotteries. It details many melancholy recent instances of infamy and suicide arising from the temptations held out by this species of gambling. It is signed by the Rt. Rev. Wm. White, Bishop of Pennsylvania, and some of the most distinguished citizens of that state.

A Savannah paper says the Duke of Bridgewater owns more than a million in the Bank of the United States.

The remarkable warmth of the season, is spoken of in newspapers from different parts of the country. At Charleston, in January, green peas and tomatoes were plentiful in the market. At Augusta, Georgia, in January fresh shad were in market, and strawberries were plucked in the neighbourhood. At Milledgeville, Ge. Jan. 7th, the mercury ranged at 70. At Wheeling, Virginia, Jan. 9th, a rose was plucked from a garden bush. At Louisville, Kentucky, in Jan. the thermometer ranged from 68 to 72 degrees. In Virginia, in the middle of January the hyacinth was in bloom—peach trees were also partly in bloom. At Savannah, Jan. 15th, vegetation was putting out buds and blossoms—the thermometer was at summer heat, and a sun flower in full bloom. Fruit trees were in blossom in Cheraw S. C. At Richmond, Virginia, on the 22d Jan. the rivers had not been frozen.—*N. Y. Daily Advertiser.*

SEEDS.

For Sale at the SEED ESTABLISHMENT, connected with the New England Farmer Office, No. 52, North Market-Street, Boston.—Orchard grass, Lucerne, Herd grass, Red top, Red and White Clover, Millet, common and Field Mangel-grass, Seed, (we reserve this Seed direct from the person who raises it in Vermont, so there can be no fault of its genuineness). Broom Corn, a few barrels White Field Peas, (very fine and pure, as the seed was all selected before planting). A few barrels Early Washington and Dwarf Imperial Peas, Mangel Wurtzel, Ruta Pasta, &c. &c.

The seeds every Friday at Three Dollars per annum, payable at the end of the year; but those who pay within sixty days from the time of sub-berling, are entitled to a deduction of Fifty Cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORN PITHS.

Sir.—One of your correspondents asks if horn piths are a manure? I answer, *they are*, and an excellent one, too, for wheat. Within two years I have used nearly twenty loads, which I procured from the comb makers. Attached to them are the roots of the horn, and some skin and hair, all of which induce fertility. My practice is to scatter them over the ground, and plough them under. Applied this way, they are some time decomposing. They would be better for the first crop if pulverized or broken, but they fertilize much longer when left whole. I think they are worth four times their bulk of manure from the yard. In addition to these, I use the comb-makers' horn shavings, which I think are superior to any other application; and I prefer them at eight cents the bushel, to stable manure at twenty five cents the two horse load, the transportation of both being two miles and a half.

FOR THE NEW ENGLAND FARMER.

WINTER EVENINGS.

The human mind cannot continue inactive. If we do not employ it in the acquirement of useful knowledge, it will be brooding upon mischief, or indulging in visionary schemes of happiness.—Neither can it remain stationary. If it does not advance in knowledge and virtue, it will retrograde into sloth and depravity—if our fields are not sown with seeds of useful plants, thistles and other vicious weeds will spring up. To the farmer who is bringing up a family of children, these considerations are of momentous concern. If he makes his fireside the scene of innocent recreation and instruction—of kind feelings and affectionate intercourse—his children will prize home before the tavern, or the haunts of dissipation. But *he must teach by example.*

The winter evenings, from September to March, estimating three hours to each, amount to thirty-eight days of twelve hours each, or to more than a fifth of the time usually devoted to business and pleasure. The future welfare of children depends much upon the manner in which this fifth part of the winter is employed. Youth is the period in which habits generally become fixed—it is the seed-time of life—and whatever is sown, be it good or be it evil, is sure to produce its kind. If the mind is cultivated, and the seeds of useful knowledge sown in youth, the harvest of manhood will be respectability, wealth, and virtue.

Impressed with the influence of early habits, I have spent some time in devising a plan to render instruction amusing and to attach my children to home, by diversifying their winter evening employments, and by familiar illustrations, adapted to their capacities, of what they read. They have received partial instruction in music and drawing, and I have furnished them with the necessary books and instruments to enable them to pursue these studies. Their readings are such books as tend to improve the heart and expand the intel-

lect—such as *interest*, while they *instruct*, the young mind. After eight, they are indulged with a rubber of draughts or backgammon. I derive pleasure, and profit from these exercises. New ideas are elicited, and valuable information acquired, from the research and explanations which my task as monitor obliges me to make.

I subjoin the arrangement for the evenings of the present winter. They may stimulate some of your readers to adopt a better system.

Monday—drawing,
Tuesday—mathematics,
Wednesday—reading,
Thursday—chemistry,
Friday—music,
Saturday—drawing, or either of the

preceding.

Albany, Feb. 19, 1828.

A FARMER.

COFFEE TREE.

Linnæus Botanic Garden,
Feb. 19, 1828.

MR. FESSENDEN.—Noticing in your last number, a description of the Coffee Tree, I am also tempted to submit some remarks, more especially as I have the trees now, both in bud and in fruit. The leaves of this tree are about the size of the common Laurel or *Kalmia latifolia* of our woods, and much resemble those of the Lemon. They are of a fine shining green, stand opposite, and being very numerous, impart great beauty to the plant. At each joint the blossom buds are now presenting themselves; they are usually in pairs, of a snowy whiteness and most delicious fragrance, and as your correspondent remarks resemble those of the white flowering Jasmine.

A promenade through a grove or plantation of these trees is said to be delightful in the extreme, where the enlivening verdure of their foliage is only surpassed by the delicate blossoms, and the delicious fragrance which is inhaled from them.—In my Hot-house the flowers in general do not fully expand until March, and sometimes not until April; the fruit from these ripens in autumn, at which period, a second crop of flowers is generally produced, but less numerous than the first.

The size of the berries may be adjudged by supposing the union of two grams of the coffee in one, with a thin pulp to cover them. They continue green during the period of growth, and then change to a bright cherry red, and interspersed among the fine foliage, contribute greatly to beautify the tree. The largest I have, is about six feet in height, of regular form and branching on all sides, and seems to flourish equally as well in the tub in which it is planted as in its native soil. The seeds vegetate freely, and it may also be increased by cuttings, by which modes I have reared a large number of them, about forty of which I have at present.

On the plantations in Cuba the trees are generally kept down to about 6 or 7 feet in height, so as to render it easy for a person standing on the ground to collect the fruit, and it is said the average produce is but little over a pound of cured coffee from each tree. I have taken much pains to obtain the various trees and plants useful in the economy of life, particularly the spices, and have now the Cinnamon, Cassia, Pimenta, Black Pep-

per, &c. Also, the Sugar Cane, Mahogany, Banana, Plantain, Mango, Mamsee, Alligator pear, Granadilla, Soarsop, Cherinoeyer, Rinyon India papaw, various species of Guava, Annatto several species of Pine apple, Fustick, Braziletto wood, Caper, Cocoa nut, Calabash tree, Roseapple, Cotton tree, Chinese Ginseng, Bamboo, Rattan, about 50 varieties of the Orange, Lemon, Citron and Lime, &c. The introduction of these and various other rare species, together with the erection of the necessary buildings for the accommodation of about 20,000 pots of Green house Plants which form my present collection, has caused the disbursements for this department alone to be very great. But this does not prevent me from going on in the same progressive manner in the introduction of every thing which I consider useful or interesting, and at this moment I am making the arrangements for erecting an additional wing to my Hot-houses, which alone will be near 100 feet in length; and for each new house I pay some tribute to your city, for I receive from it all the glass necessary for the purpose, as experience has taught me it is much to be preferred.

Yours, most respectfully,

WM. PRINCE

HEMP AND FLAX.

We are indebted to the Hon. Mr. Everett, for several public documents; among the most important of which, is a report of the Navy Department, in relation to experiments on American water rotted hemp, when made into canvass, cables, and cordage. The commissioners of the navy have, for some time, been actively engaged in testing the quality of cordage manufactured of American hemp, compared with that made of the Russian material; and to aid their decisions, they have appealed to the experience of manufacturers and merchants, and the result of their enquiries has been, a conclusion that American hemp, properly cultivated, and suitably prepared, would be at least as strong and durable as that of Russian growth. The disadvantage under which American hemp has hitherto labored, is owing to the pertinacious adherence of our farmers to the *old* plan of dew rotting—a process so exceedingly slow, as to impair, in a very essential degree, the strength of the fabric. Where water rotting has been resorted to, better success has attended the cultivator, the hemp has worn a much handsomer colour, and has proved as strong in cordage as Russian.

We have, ourselves, in recent conversation with gentlemen conversant with the cultivation of hemp and flax, had reason to know that American hemp may be raised with great profit to the cultivator, & with every advantage to the manufacturer. Indeed, one great advantage attends the use of the American article. That from Russia, as is stated in the report, is liable to be exceedingly heated, coming in large bulk in the ship, and to lose by that process, some of its strength—an evil to which American hemp is not liable. American hemp used in the manufactory of sail-cloth, has not proved so well adapted to the purposes designed, and stout flax has generally been used. It is established, that water rotted American flax, is

equal in strong cloth, to that of any other country. Hemp might be brought into this use, if gathered younger than is usual. A machine has been invented for dressing hemp and flax, without the process of rotting or steeping it—but as the gummy and mucilaginous matter is not, by that process, drawn out of the material, it may be doubted whether the strength is not liable to be lessened. *Phila. Gazette.*

From the New York Farmer.

On the cultivation of the Strawberry, by Mr. WILLIAM CURR, of New York, read Feb 26, 1822. To the President and members of the Horticultural Society of New York.

GENTLEMEN—I take the liberty to lay before you a short sketch of the method practised by me in cultivating the Fragaria or strawberry plant, together with a few observations which I consider will be found of advantage to the cultivator of that excellent fruit.

The patch on which I have my strawberries, had been under the same plant for several years. For the month of September, 1819, I laid on about five inches tuck of well rotted manure, which I dug down with the old vines. I then set out plants of the Hud-on kind of strawberry at the distance of sixteen inches each way, taking care to have them in line the long way of the ground. In the month of November I covered the plants with a thin coat of long litter, which I took off in the beginning of April, and pointed the ground with the spade, and raked it smooth. The ground was kept clean by hoeing till the fruit began to form. I then took short grass cut from the walks and spread between and under the vines, which had the effect to keep the fruit clean, the weeds down, and kept the scorching drought from penetrating into the roots of the plants.

As soon as the fruit season was past, I pointed in the grass between the beds. In September, 1820, I cut out all the superfluous runners and dressed the bed, and in the month of November covered as before.

On the first of March of last year, 1821, I took the covering from a part of the patch and replaced it with one inch thick of straw, which I burned off, as directed by Dr Miller. I then gave a slight hoeing and raking. At this time there was hardly the least trace of vines left on the ground; but in 8 or 10 days the leaves began to make their appearance. On the 22d of March, I uncovered another part of the patch, a part of which I burned with straw as before, and the other part with a parcel of dry leaves, which I laid on two inches thick. The remainder of the patch I uncovered in the beginning of April, and dressed in the usual way.

The first burned part continued to keep more forward than the others, and showed flowers eight days sooner than the unburned part of the patch. The unburned grew less rapid, and was considerably less productive of fruit. That part burned with leaves was the most luxuriant in growth, the quantity of fruit nearly the same as those burned with straw.

The burning has this good effect, that it keeps the ground more clean of weeds, and will doubtless kill a great many insects and their eggs; besides, it clears the vines from all decayed leaves and hardened bark, gathered around the body of the plant: and by that means allows the free expansion of the leaves and flowers.

I am of opinion that leaves when dry, will answer the purpose of burning equally with straw, and their ashes prove a good manure

I shall now give a few observations concerning the selecting of proper plants for planting. A great deal lies in choosing proper plants; for if they are taken promiscuously, the greater part will prove barren, producing plenty of flowers but no fruit. Those when examined will be found to want the female organs of generation; that is, they will have abundance of stamina, but few or no styles; so that it often happens among those barren plants, that some of them have a part of an imperfect fruit formed, which sometimes ripens. Plants ought, therefore, never to be taken out of old neglected beds which have been allowed to spread and run into a multitude of suckers, nor from any plants which do not produce plenty of fruit. Those suckers which stand nearest the old plant, should always be selected in preference to those produced from the trailing stalks, at a distance from the fruit bearing plants.

There has some kind of strawberries been greatly improved by seed selected from the largest and finest fruit. In this case the seed should be sown as soon as possible after the fruit is eaten. The best way is to sow the seed in pots or boxes, placed in the shade.

Should some of the members of this Society put this in practice, the result might be of general advantage, by improving the different sorts of this delicious fruit

WILLIAM CURR.

New York, Feb. 26, 1822.

FOREST.

Every farm ought to have a piece of wood-land, or forest, sufficient for fuel and other purposes.—Raising timber, for the purpose of fencing, will not often be found advisable. Farmers must eventually depend on making stone walls, or hedges, for the purpose of enclosing their lands. But wood and timber sufficient for fuel, for building, for carriages, and implements of farming, cannot be dispensed with. Of these, the farmer will always find it most advantageous to keep the requisite stock himself, and not only rely on others for purchasing it. Nor is it advisable to have his woodlands separate, and at a considerable distance from his farm; unless it be in parts of the country where part of the lands are too valuable to be kept in wood, and other adjacent parts are only fit for that purpose.

When the farmer is clearing up his farm, he ought to reserve, for woodland, that part which is best adapted for tillage or for grass. Land which is swampy with a thin soil over a sandy bottom; that is rocky and hilly; or that is dry, poor, or very gravelly, may do well for woodland; while it would answer but indifferently for tillage.

The quantity of ground to be set apart for this purpose must depend on the size of the farm; the quality of the soil of the woodland; the nature of the climate; and, frequently, according to the demand or market for wood: for, in some cases, it may be found more profitable to keep tolerably good land in wood, than in any other cultivation. Of the natural growth of wood it will require as much as twenty acres, or more, to keep two fires, according to the common method of using wood for fuel; but it is a very easy matter to have sitting rooms warmed, and all the cooking and other apparatus of the kitchen so contrived, as not to require more than one-third of the wood that is commonly used.

To thicken a forest, or to prevent its becoming too thin, cattle should be kept out of it at all seasons. The seeds, or cuttings of trees, of rapid growth, should also be set, or planted, in every part that becomes destitute of growing wood. If woodland be suffered to become so thin, that the sun can get in and cause the ground to be covered with a sward of grass, this will prevent the further growth of young timber; and in this way the ground eventually becomes stripped of all its growth. This, however, is not the case with the locust, as it encourages the growth of grass amongst it, and in this situation grows very rapidly. Perhaps the farmer will find, when he is reduced to the necessity of planting wood for fuel that this tree will answer his purpose best.

The Lombard's poplar also grows very rapidly, is easily raised from cuttings, and, when cut and dried, will answer tolerably well for fuel.

The easiest method of raising the locust is as follows: Plant, in the first instance, about fifteen or twenty trees on an acre; when they have got to be twelve or fifteen feet high, and their roots well extended, run straggling furrows through the ground, and wherever the roots are cut with the plough, new trees will start up, and soon stock the whole ground with a plentiful growth. This tree has been but lately introduced into general use in France; and it is said to be there valued more than any other which is cultivated in that Country.—*Farmer's Assistant.*

SCRATCHES, OR SELENDERS.

This is a disorder between the hinder pastern joints and hoofs of horses, consisting of cracks and soreness, with supuration. It is troublesome commonly in the winter season only. "Nothing tends so much to prevent grease and swelling of the legs, as frequent hand-rubbing; and washing the heels carefully with soap suds, as soon as a horse comes in from exercise. In inveterate cases where the disease appears to have become habitual in some degree, a run at grass is the only remedy; if a dry pasture be procured where a horse can be sheltered in bad weather, and fed with hay and oats, it will be found extremely convenient, as in such circumstances he may perform his usual labor, and at the same time be kept free from the complaint."—*The Complete Farrier.*

AGRICULTURAL IMPROVEMENTS.

There are few individuals who held a more distinguished place among agricultural improvers than the Earl of Egremont; forty years ago, the Stag Park, at Petworth, consisting of between seven and eight hundred acres of land, presented a wild forest scene, over-spread with furze, stunted timber—and rubbish, and would have been dear if let at five shillings per acre. Somewhere about the year 1790, the noble owner of this unproductive tract, undertook to improve it; the timber was felled—the underwood grubbed—every part of the ground has been since effectually drained—and the whole enclosed and divided into proper fields, by neat and regular white-thorn hedges. Under a well arranged system of tillage, it yields barley, tares, and turneps—clover, rye, chicory, rape, and other artificial grasses, in great profusion; the crops are so luxuriant, that few tracts which let even for thirty shillings per acre, can be considered more productive. Ten quarters (eighty bushels) of oats, and five quarters of wheat are now raised upon an acre of land, on which

a sheep would have starved before this improvement.

Little more than fifty years ago, Clumber Park, which belongs to his grace the Duke of Newcastle, and contains no less than 4000 acres of land, was a black, dreary, unproductive heath, within the limits of the ancient and extensive forest of Sherwood. About 1760, the genius of agriculture lighted upon this desolate waste—a magnificent mansion was built by the noble owner—the heath disappeared—2000 acres were planted—which now exhibit the agreeable appearance of thriving timber of very large dimensions, and the remaining 2000 acres, under a spirited and intelligent system of husbandry, yield excellent crops of different grains and grasses;—besides other live stock, the sheep fed on a district which half a century ago was perfectly barren, amount at least to 4000 annually.—*Lon. Quar. Review.*

Extracted from Deane's New England Farmer.

SEEDS OF VEGETABLES,

The last product, by which their species are propagated, being frequently all the fruit of a plant, but sometimes only a part included in the plant. Every seed contains a plant in embryo. The embryo, which is the whole future plant in miniature, is called the germ or bud; and is rooted in the cotyledon, or placenta, which makes its involucre, or cover. The cotyledon is always double; and the middle, or common centre of the two, is a point or speck, namely, the embryo plantule, which being acted on by the warmth of the sun and of the earth, begins to protrude its radicle or root, downwards, and soon after, its plumula, or bud, upwards; and as the requisite heat continues, it draws nourishment by the root, and so continues to unfold itself and grow. The two cotyledons of a seed, are a case to the little embryo plant; covering it up, and sheltering it from injuries, and feeding it from its own proper substance; which the plantule receives and draws to itself by an infinite number of little filaments, which it sends into the body of the placenta. The cotyledons for the most part abound with a balsam disposed in proper cells; and this seems to be oil brought to its greatest perfection, while it remains tumid, and lodged in these repositories. One part of the composition of this balsam is oily and tenacious, and serves to defend the embryo from any extraneous moisture; and, by its viscosity, to entangle and retain the fine, pure, volatile spirit, which is the ultimate production of the plant. This oil is never observed to enter into the vessels of the embryo, which are too fine to admit so thick a fluid. The spirit, however, being quickened by an active power, may possibly breathe a vital principle into the juices that nourish the embryo, and stamp upon it the character that distinguishes the family; after which, every thing is changed into the proper nature of that particular plant. Now when the seed is committed to the earth, the placenta still adheres to the embryo for some time, and guards it from the access of noxious colds, &c. and even prepares and purifies the cruder juice which the young plant is to receive from the earth, by straining it through its own body. This it continues to do, till the embryo plant being a little enured to its new element, and its root tolerably fixed in the ground, and fit to absorb the juice thereof, it then perishes, and the plant may be said to be delivered; so

that nature observes the same method in plants, as in animals, in the mother's womb. Many sorts of seeds will continue good for several years, and retain their vegetative faculty; whereas others will not grow after they are one year old. This difference, is in a great measure, owing to their abounding more or less with oil; as also to the nature of the oil, and the texture of their outward covering. All seeds require some share of fresh air, to keep the germs in a healthy state; and where the air is absolutely excluded, the vegetative quality of the seeds will soon be lost. But seeds will be longest of all preserved in the earth, provided they are buried so deep as to be beyond the influence of the sun and showers, since they have been found to lie thus buried twenty or thirty years, and yet vegetate as well as new seeds. How the vegetative life is so long preserved, by burying them so deep, is very difficult to explain; but as the fact is very well known, it accounts for the production of plants out of earth taken from the bottom of vaults, houses, &c. In the common method of sowing seeds, there are many kinds which require to be sown soon after they are ripe; and there many others which lie in the ground a year, sometimes two or three years, before the plant comes up. Hence, when seeds brought from distant countries are sown, the ground should not be disturbed, at least for two years, for fear of destroying the young plants.

As to the method of preserving seeds, the dry kinds are best kept in their pods or outer coverings; but the seeds of all soft fruits, as cucumbers, melons, &c. must be cleansed from the pulp and moulage which surround them; otherwise the rotting of these parts will corrupt the seeds.

When seeds are gathered, it should always be done in dry weather; and then they should be hung up in bags in a dry room, so as not to deprive them of air.

The seeds of plants exalted by cultivation always furnish large and improved varieties; but the flavor, and even the colour of the fruit seems to be a matter of accident. Thus a hundred seeds of the golden pippin will all produce fine large leaved apple trees, bearing fruit of considerable size; but the tastes and colours of the apples from each will be different, and none will be the same in kind as those of the pippin itself. Some will be sweet, some sour, some bitter, some mawkish, some aromatic, some yellow, some green, some red, some streaked. All the apples will, however, be more perfect than those from the seeds of the crab, which produce trees all of the same kind, and all bearing sour and diminutive fruit.

It has been recommended when seeds are intended to be sent a great distance, or it is wished to preserve them a long time, to wrap them in absorbent paper, and surround them by moist brown sugar.

Mr Humboldt has found, that seeds, which do not commonly germinate, become capable of germinating when immersed in oxygenated muriatic acid gas mixed with water. If the liquid be a little warmed, it will quicken the vegetation of seeds surprisingly. Cresses thus treated exhibited germs in three hours. Seeds which were more than an hundred years old, were also made to vegetate by those means.

Old seeds may likewise be made to germinate by immersing them in water nearly boiling hot, for about half a minute, and cooling them sudden-

ly by exposure to air. But if such seeds are sown when the earth is cold, they will rot in the ground.

HORN DISTEMPER.

This is a disease of neat cattle, the seat of which is in their horns. Cows are more subject to it than oxen. It does not attack bulls; and steers and heifers, under three years old, have not been known to have it. The distemper gradually consumes the pith of the horn. Sometimes it is in both horns at once, but more usually in one only. The disease is discoverable by the coldness, or loss of the natural warmth of the horn; by dullness of the eyes, sluggishness, loss of appetite, and a disposition to lie down. When the brain is affected, the cattle will toss their heads, and groan much, as if in great pain. To effect the cure, the horn should be perforated with a nail gimblet, through which the corrupted thin matter will be discharged, if care be taken to keep it open. By this boring, which should be nearly horizontal, or in the depending part of the horn, and two or three inches from the head of the animal, the cure sometimes is completed. When it proves otherwise, a mixture of rum and honey with myrrh and aloes, should be thrown into the horn with a syringe; and be several times repeated, if the disease continue. For a more particular account, see a letter from the Hon. C. Tutts, Esq. in the first vol. of the Memoirs of the Academy of Arts and Sciences.—*Ibid*

WEIGHT OF CATTLE.

In the Picture of London, for the present year, it is stated, that about the year 1700, the average weight of oxen killed for the London market, was 370 pounds; of calves, 50 pounds; of sheep, 28 pounds; and of lambs, 18 pounds. The average weight at present is—of oxen, 200 pounds; calves 140 pounds; sheep, 80 pounds; and lambs, 50 pounds. The whole value of butcher's meat, as sold in Smithfield, is about eight millions sterling.

White Weed has a five cornered stalk. The leaves are jagged and embrace the stalk. The flowers are discous, large, radiated. The ray is white, and the disk yellow; the seeds have no down. It flowers in June, and is perennial in the roots.

When this weed has got possession of the ground, no good grasses grow with it; because, perhaps, the roots bind the soil in such a manner as to cramp other roots. Or being a stronger feeder it deprives other roots of their food.

When it is in its green state, neither neat cattle nor horses will eat it. But if it be cut while in blossom, and well dried for hay, the cattle will eat it freely in winter, and live well on it. The crop however is always thin and light. If it is mowed late, or not well cured and preserved, the hay will be of very little value.

Dunging the ground is an enemy to this weed, and it is said that pasturing with sheep kills it.—

But to conquer it effectually, there can be no better way than to use the land in tillage, for hoed crops, several years in succession.

Curiosity.—The Middletown. (Conn.) Gazette mentions, that in cutting an elephant's tusk at a comb factory in that city, a few days since, two iron bullets were found imbedded in it—the surface of the tusk being perfectly smooth.

GRAPES.

Linnæan Botanic Garden, }
Feb. 20, 1828. }

MR FESSENDEN—I send you herewith some further extracts from my Treatise, (now in press) which you can publish as "Extracts from Prince on Horticulture."

Yours most respectfully,
WM. PRINCE.

Of all the fruit cultivated in the United States there is none more generally esteemed than the grape; yet, in the middle and northern states, this fruit is seldom met with in perfection except in cities. The Proprietor having attended particularly to the cultivation of the grape for twenty years past, can confidently assure those who wish to have this fruit in perfection, that they may depend on their vines producing well if they will attend to the following directions; for although a season may sometimes occur when the cold and wet will retard the ripening of the fruit, yet even in the worst seasons a tolerable crop may be calculated on.

There are two causes why the cultivation of the vine has not been successful throughout the country, attention to which is indispensably necessary: the first is the proper selection of those kinds which are suitable to the respective climates, and which in this latitude should come to perfection by the middle or end of September; the second is the want of attention to the culture requisite for ripening the wood, which in cities is effected by the dry warm air with little or no care, but in the country requires art and attention to produce the desired effect. I have, therefore, given the following list of grapes, with brief descriptions of their qualities, &c. followed by a general comment on the culture and properties of the vine, which I hope may be considered as useful to those not fully conversant with the subject.

Many of the grapes will be found to differ essentially from fruits cultivated under similar names in some parts of the United States, as in many instances the possessors of grapes of doubtful origin have attached to them the names of old establishments' fruits. This practice, so common in our country, and so calculated to disseminate error, cannot be too greatly deprecated.

So confident has the Proprietor ever been of the success which would attend the culture of the vine in this country, and of the utter inconsistency of the fallacious ideas which have been advanced to the contrary, that he has invariably continued to extend his collection of vines, by importations, of the choicest kinds from every clime; and he has, during the seasons of 1825 and 1827, had near 100 kinds to produce fruit equal to that of France, nearly all of which ripened in August and early in September, he considers these doubts as entirely set at rest. *Specimen vines* of every kind have been planted out for bearing, and persons desirous of seeing the fruit can view them at the season of ripening. Such persons as desire a selection of varieties most suitable to their particular localities, can have the selection made by the author. It is intended, in the copious work now preparing on "American Horticulture," to insert engravings of a number of varieties of the grape.

1. *July Grape, or Morillon Hartif.*—This is also called the Madeleine; it is the earliest grape known in France. The bunches are small, the fruit is also small, of a deep violet colour, and

pleasant flavor, but it is not much esteemed, except for its early maturity; ripens here early in August.

2. *White Muscadine, or Early Sweet Water.*—This is a round grape, with a thin skin, and of delicate flavor; it is a great bearer, and resembles the White Sweet Water in almost every respect, except that it ripens much earlier, being usually in perfection from the 20th to the end of August. It is recommended as particularly suitable for the country, and for more northern latitudes, where, with attention, it will be sure to yield plentifully and regularly.

3. *White Sweet Water.*—This has very large round white berries close on the bunch, which is of a good size; the skin and flesh are very delicate, and replete with very agreeable juice; the berries on the sides of the branches next the sun are often clouded with spots of a russet colour.—This grape flourishes admirably in our cities, where large quantities are annually sold in the shops, and some bunches have weighed near two pounds. It is somewhat singular, that although it flourishes without protection in the city of New York, yet I have never known a grape more sensible to the early frosts in the country, where, if unprotected in winter, it is when young killed to the ground. It is therefore not recommended for the country in this latitude.

4. *Black Sweet Water.*—This is a roundish fruit, growing in small compact bunches, is very sweet, and ripens in September.

5. *Muenier, or Miller's Burgundy.*—This is one of the earliest grapes; the berries are black, of moderate size, rather oval, and pretty closely set on the bunches, which are short. Its leaves particularly when young, are covered with a white down, which easily distinguishes it from others, and whence it derives its title. The juice is pleasant and vinous; it is an excellent wine grape, and produces well; is very hardy, a sure grape for a crop, and is one of those that will succeed farthest north. It enters largely into culture in the vineyards of France, and is well calculated to succeed for the same purpose in this country.

6. *White Morillon.*—The berries are nearly round, and form a bunch of good size; the fruit in flavor resembles the Black Morillon, but is rather more sweet; it is a pleasant early table fruit, and ripens at the end of August or beginning of September.

7. *Striped Aleppo.*—This is a variety of the Morillon; the berries are on some bunches black, on others white, but very frequently black, white, and striped on the same bunch; the fruit is similar to the Morillon Noir in quality, being pleasant, and ripening early. It is sometimes called Raisin de Suisse, and by others Morillon Panache. I consider this grape would mature its fruit at Boston, and for some distance to the north of it; ripens end of August or beginning of September.

8. *Auvernat, or Pineau Noir.*—This is a wine grape much cultivated in Burgundy; the berry is not large, but closely set on the bunch, and of agreeable flavor; the bunches are but of moderate size. It is often called Pineau Noir, but is quite distinct from the following; ripens beginning of September.

9. *Pineau France.*—A fruit of minor size and oblong, with small bunches of a form somewhat conical, and the berries closely set on the bunch; it is not the most productive, but its fruit is of ex-

cellent flavor, and produces the most delicate wines of Burgundy. The finest vineyards of that part of France are most composed of the varieties of the Pineau, and of the Morillon. They all ripen about the same period, and in this vicinity are at maturity the beginning of September.

10. *Pineau Gris, or Grey Burgundy.*—This grape, also called Auvernat Gris, is used in connexion with the Auvernat Blanc, and Auvernat Rouge Claire, to form the far-famed Champagne wine. The bunch of this is short, unequal in its form, and moderately large; the berries are round, pretty close, sweet, fine flavored, and of a greyish colour. Formerly many vineyards in France were entirely composed of this grape, and at present it forms a large proportion of several. It is sometimes called Grisset Blanc; ripe in September.

11. *Pineau Blanc, or White Burgundy.*—This grape is also called Bourgignon Blanc; the berries are somewhat oblong, and so closely set on the bunch, that in very rich soils it is not uncommon for a portion to fall off in order to give space for the remainder. The fruit when ripe, is of a yellow colour; ripe in September.

12. *Bourgignon Noir.*—This is another variety of the Morillon, and is somewhat allied to the Pineau; the berries are, however, less closely set on the bunch, and the fruit less oval than the latter; they are black and sweet and the bunch is often winged or shouldered. It is cultivated in connexion with the others referred to in the fine vineyards of Burgundy, and ripens at the same time.

13. *White Chasselas, Royal Muscadine, D'Arboyer, or Chasselas Blanc.*—This has round amber-coloured berries, of moderate size, thin skin, and soft juicy flesh; the bunches are very large; it is a great bearer, and ripens in September.

This grape, which is the most cultivated for the table in the middle of France, but which does not come to perfection in the north of that country, unless in very favorable localities, does not fail to regularly ripen its fruit in the vicinity of New York; and when excellent wines are made far north of where this grape is found to succeed, it proves at once the fallacy of the assertions made by some, that vineyards cannot succeed in this vicinity. One circumstance is fully proved in the experiments with the above grape, which is, that if our season is in reality shorter than in some parts of France, where it flourishes, still, that its greater intensity compensates for the shortness of its duration. Col. Clapp, of Oxford county, New York, has found this grape to ripen perfectly well in that locality, but he covers the vines in winter; they ripen with him the beginning of September.

The varieties of the Chasselas are considered in France among the finest of their table grapes, and are very extensively cultivated for that purpose.

14. *Red Chasselas.*—This is similar to the white in size and shape, but it is of a red colour next the sun; it is considered a good grape, and ripens rather later than the white.

15. *Golden Chasselas.*—A round fruit of amber colour, melting, sweet, and of excellent flavor; the skin rather thick, and the bunches are of good size; leaves pretty deeply indented, and on a long petiole; ripens in September.

16. *Musk Chasselas.*—Rather smaller than the above, and ripens later; a white, round berry, sweet, and of a musky flavor.

40. *Cioutal*, or *Parstey Leaved*.—This is a variety of the Chasselas, with finely cut or divided leaves; fruit of fine quality, delicate and juicy; the berries and bunches size of the White Muscadine; ripens early in September. There are two varieties, the red and the white.

41. *White Frontignac*, or *Muscat Blanc*.—The berries are of good size, somewhat oval, and of an amber colour next the sun; the bunches are long, and terminating to a point, and the berries pretty closely set; the juice luscious and musky, and of exquisite flavor; perhaps no grape is superior to this as a table fruit. It has been remarked, that this grape does not come to maturity in the north of France, except in situations particularly favorable; at Long-Island it ripens in September.

42. *Red Frontignac*, or *Muscat Rouge*.—This grape ripens earlier than the preceding, its berries being less closely set on the bunch; it is also less highly flavored. The fruit is of a lively red colour, and round; the bunch is oblong, and the peduncle which supports it is remarkable for its size; ripe in September.

43. *Black Frontignac*, or *Muscat Noir*.—This has very large round fruit, covered with a mealy bloom, and of a very fine flavor. It is called, at the Cape of Good Hope, the Black Constantia; ripens in September.

44. *Violet Frontignac*, or *Muscat Violet*.—The leaves are similar to the white variety; the berries are large, oblong, of a violet colour, and high musk flavor; they are powdered with a fine bloom, and are very delicious. I consider it one of the best table grapes; ripens in September.

45. *Grizzly Frontignac*, or *Muscat Gris*.—The berries are round, tolerably large, colour brown, red and yellow intermixed, and they have a high musky perfume flavor ripens in September.

46. *White Muscat of Alexandria, Malaga, or Alexandrian Frontignac*.—This is of high musk flavor when it is at maturity, for which purpose it requires a very warm situation; the berries are very large, oval, and of regular form, without being too closely set; bunches of beautiful appearance; when perfectly ripe they are of a fine amber colour. I consider this the same as the White Muscadel. *To be continued.*

In Congress—House of Representatives.

SILK AND SILK WORMS.

The Speaker laid before the House the following letter:—

Washington, Feb. 1, 1825.

SIR,—I have the honor to present to Congress, through you, a treatise on the rearing of Silk-worms, by Count Von Haggi, of Munich, who sent it to me for this purpose. The Count has seen the Resolution of the House of Representatives, directing the compilation of a manual on the culture of silk, and was desirous to promote the patriotic views of the House, by sending the result of his labors on the same subject, and the evidence of the good will be bears the United States.

I have the honor to be,

Very respectfully,

JAMES MEASER.

The Hon. Mr. Stevenson,

Speaker of the House of Representatives.

The Letter, and the Treatise accompanying it, were referred to the Committee on Agriculture. It was also ordered to be translated into the English language and printed, with the plates therein contained.

REMOVING ROCKS.

In perusing a new work, entitled "Thompson's Travels and Adventures in Southern Africa," I was struck with what I conceived to be a novel mode of removing rocks which may obstruct the course of canals; and as this subject has become one of immense importance, in our State particularly, I thought it might be of importance to transcribe it for insertion in your widely circulating paper. Speaking of a canal near the town of Graaff reinet, he says, "this canal has been greatly improved, or rather constructed anew, on a much higher level, by the present Landrost, who by indefatigable exertions, and entirely at his own risk, has carried it along the front of a rocky precipice, and by these means gained a large addition of arable ground, and a more certain and abundant supply of water. I was not a little surprised to find that this arduous task had been accomplished without even the aid of blowing irons or gun-powder, merely by kindling large fires upon the rocks, and when they were well heated, dashing buckets of water upon them. By this simple process, immense blocks had been split, and rolled from the path of the water-course.—U. S. Gazette.

From the Hampshire Gazette.

Ma Judo—An article in your last from Niles' Register says: "Already the farmers stand with whetted knives to kill off these useful animals," (sheep.) A friend from Genesee River informs me that many of the farmers in that part of the country are now killing off their sheep. One man in Livingston Co. who went from Northampton, was butchering his flock at the rate of 50 per day. He gave the meat to his hogs. Pork is worth only from 2½ to 3 cents in Rochester; of course mutton must be dog-cheap. This destruction of sheep will gratify those who are so anxious to have us purchase British wool, meat, and grain, in the shape of British woollen cloths.

Preparations of Spruce.—Early in the spring cut off the young branches of the pine or fir tree, three or four inches in length, and break them into small pieces; boil them in water, and after filtering the extract through a sieve, add to sixteen gallons of it, about six pounds of sugar. It may then, by boiling, be reduced to a syrup—which will keep in bottles for a length of time. For beer mix three pints of this extract with thirty of water, boil it for about two hours, and when cold, put it into a cask, [a fresh emptied wine cask is the best] and ferment it in the usual manner.

From Cobbett's American Gardener.

FLOWERS AND ORNAMENTAL GARDENING IN GENERAL.

I shall now proceed to give an Alphabetical List of such flowering Trees, Shrubs and Plants as I think worthy of cultivation; or, rather, that I myself would wish to have about my house, or in my garden. As I go on I shall state some particulars here and there relating to propagation and management; but, to be very particular would be superfluous, seeing that such full directions have been given in the former parts of the work, as to the sowing of all seeds, great as well as small; as to the raising of trees and plants from cuttings, slips, layers and suckers, and as to cultivation and tillage. Flowers are divided into *annuals*, *biennials*, and *perennials*. The first blow and the second year they are sown; the second blow the second year and then die; the third sometimes blow the first year and sometimes not, and die down to the ground annually, but spring up again every spring. I have not made separate lists; but have included the whole in one Alphabetical List. There are sixty trees, shrubs and plants altogether; and, if properly cultivated, these will give a grand bloom from May to November.

LIST.

ALTHEA FRUTEX.—It is raised from seed, or from suckers. There are several sorts, as to colours. They should be mixed to make a variety. Save the seed in November or December. The pods are full. Sow in the spring. Seed produces the handsomest shrub; and it is to be got almost any where.

ANEMONE.—This is a very beautiful flower, and worthy of great pains. It is raised from seed, or from pieces of the roots. Sow the seed in spring. The plant does not blow the first year. The root, which is *tuberous*, is taken up in the fall, dried in the sun, and put by in dry sand till spring, when it is put into the ground again. And, during the summer, it sends out young roots, which must be taken off and planted out, to become *blowers*.—There is a great variety of colours and of sizes of the flower.

ARBUTUS.—A pretty ever-green, as well known as the oak tree; and is to be got every where.

ASTERE (China).—*Astria* is French for *stars*, and this flower, in its shape, resembles a star to our view. It is *annual*, bears great quantities of seed, and is sown early in spring. An infinite variety of colours, and great quantities of blossoms. It gives no smell; but a clump of it furnishes a great mass of beauty to the sight.

AURICULA.—This is one of the flowers, the sorts of which are distinguished by having awarded to them the names of famous *men* and *women*, famous *cities* and famous *battles*, and so forth. It may be raised from seed; but the flowers proceeding from plants so raised, do not resemble the flowers of the mother plant, except by mere accident. It is a chance if you get a *fine flower* from a whole sown bed. Now and then one of this description comes, however, and this adds to the list of *names*, if it happen to be one of the like of which has not made its appearance before. Auriculas are, therefore, propagated by parting the roots, and every root sends out several young plants annually.—When sown, they do not blow till the 2nd year; but the old roots last for many years. Some of these should be potted, and kept to blow in the green-house. If planted in the natural ground, they ought to be covered a little in the winter.—There are many hundreds of sorts with *names*.—So many indeed, that the godfathers in England have been so put to it for great personages to baptize the flowers after, that they have been compelled to resort to the heroes and heroines of Romance; accordingly they have *Don Quixote* and *Sancho*. However, vanity supplies the florists, as well as the ship owners, with a great store of *names*, and auriculas, like ships, are very frequently honored with the names of the original proprietor's wife or daughter.

AZALEA.—That little American Honeysuckle that impedes our steps when shooting on the skirts of woods. It, however, blows profusely, though it has no smell like the English honeysuckle.

BALSAM is an *annual* and a most beautiful

plant, with great abundance of flowers. Sow when you sow Melons, at a distance of four feet; leave only one plant in a place: let the ground be rich and kept clean; it will blow early in July, and will keep growing and blowing till the frost comes, and then, like the cucumber, it is instantly cut down. I have seen Balsams in Pennsylvania 3 feet high, with side-branches 2 feet long, and with a stem much bigger than my wrist, loaded with beautiful blossoms. Plant branch, leaf, flower: all are most elegantly formed, and the colours of the flower extra-ordinarily vivid and various.—There are, however, some more double than others, and some variegated. The seed of these should be sowed, and it comes in great abundance. The flower of the Balsam has no smell.

BALAN (Sweet).—A well known shrub of the rose. Rows of it carefully planted and pruned make very good hedges, and it will grow in almost any ground, though fastest in good ground.

CASSELLIA.—This shrub, which is of the laurel-triber, has lately been introduced in England from Japan. It bears a flower, which, when open, resembles a good deal a large full blown rose; and these flowers, on different plants, are of different colours. It is raised, doubtless, from seed; but it may be grafted on the Hawthorn; and, I dare say, on the Crab. Some of the plants have been sold at 20 or 30 pence each. By this time they are probably sold at a dollar. The plant as well as the flower are handsome; and certainly cuttings for grafting may easily be brought from England. They will stand the winter as well as any of the American laurels.

CARNATION.—Here is beauty and fragrance, and both in the highest degree. There are various sorts, distinguished, like those of the Auricula, by names; and what is said of the seed of the Auricula applies here. If sown, the carnation does not blow till the second year. It is usually propagated by layers. While it is blowing, it sends out several side shoots near the ground.—These are pinned down in August, to the earth, with a little stick with a hook at the end of it.—A little cut, or tongue, is made on the under side of the shoot; and thus the head of the shoot is brought upright. The part that touches the ground is well covered with earth; and roots come out here before the fall. Then the stalk which connects the young plant with the old one is cut off; the young plant is transplanted, and the next year it blows. The old root does not stand another year well; and, therefore, its branches are thus made use of to keep up the race and the sort. Carnations are rather tender to frost, and must be well covered in this country to live through the winter. It is best to put them in large pots to give room for laying; and to keep them in a green house in winter, or in some house, where they can have sun and air.—However, they merit all the pains that can be bestowed upon them.

CLOVE.—Is only a more hardy and less esteemed sort of *Carnation*, which see. It may be propagated like the *Carnation*; or, by cuttings, which is the easier way. Instead of laying down the side shoots, you cut them off. Then you cut away the hard part of the shoot, strip off three or four of the bottom leaves. Tip the rest of the leaves; make a little split in the butt of the shoot, and then, with a little smooth pointed stick, plant the cutting in the ground. This is to be done

early in August. The young Cloves will have roots in the fall; and you may transplant them into the open ground or into pots to blow the next year. The old Clove plant, will, however, blow for many years. I should think, that, with good covering, such as directed for spinach, Cloves would live out the winter in this country.

COLEMBINE.—A perennial. Very common; but very pretty.

COWSLIP.—This is one of the four flowers, without which English pastoral poetry would be destitute of that which awakens the most delightful ideas. The *Cowslip*, the *Primrose*, the *Field*, and the *Daisy*, are of endless recurrence in this species of writing. They all come early in the spring; and are all beautiful. Neither of them is seen here, and they all might; for they will bear any severity of weather. The *Cowslip* is of the *Polyanthus* true. It is of a delicate yellow colour, and sends forth many blossoms from the same stem, which rises about six inches from the ground. It may easily be propagated from seed, which it bears in great abundance, but, when you once have a plant, the easiest way is to propagate from offsets. The plants raised from seed do not blow till the second year. The plant is perennial. The flower has a delicate sweet smell, and also sweet taste, as a proof of which, cart-loads of the flowers, plucked from the stalks, are sold in London to make "*wine*" with; that is to say to furnish drinkers with an apology for swallowing spirits under the specious name of *Cowslip-wine*. The leaf of the flower very much resembles in shape the under lip of a cow, whence, I suppose, our forefathers gave the plant the name of *cowslip*.

CROCUS.—A bulbous rooted plant, very well known. It is recommended by its earliness. It is perfectly hardy. The only thing to do, when it is once planted, is to take care that it does not fill all the ground near it. There are yellow, blue and white Crocuses. And they are pleasant when nothing else is in bloom, except, at least, the *Snowdrop*, which departs soon after the *Crocus* begins to appear.

DAISY.—I cannot say, with Dryden's damoels, in one of his fine poems, that "the *Daisy smells so sweet*"; for it has very little smell; but it is a most beautiful little flower, and blows without ceasing at all times when the grass grows, however little that may be. The opening of the *Daisy* is the sure sign that there is growth going on in the grass; and these little flowers bespangle the lawns and the meadows, the green banks and the glades all over England. Their colours present an endless variety; and those grown in gardens are double. The field daisy is single and about the size of a York Sixpence. Those in the gardens are sometimes as broad as a quarter of a dollar. And there is one sort, called the *Hen-and-thicken Daisy*, that has a ring of little flowers surrounding the main flower. This plant may be raised from offsets or seeds, in which last case it blows the second year. It is perennial.

(To be continued.)

Tobacco.—Gov. Clinton, in his last message to the Legislature, recommended the cultivation of tobacco in New York, as a profitable crop. A writer in the Rochester Daily Telegraph, mentions as the result of an experiment, made by him last summer, that it is a more productive crop than any now raised in the western counties of

the State. He is confident that the soil and climate are both well adapted for raising the high priced yellow tobacco, but not so good for dark low priced tobacco, [used for chewing,] as the Southern States.

Hops.—E. A. Le Breton, inspector of hops in Albany, from the 24th ult. made a report to the Legislature, from which it appears he has inspected within the year, (ending the first of Jan. 1828) 2402 bales of hops, weighing 719226 lbs. raised and presented from the following counties. Madison, 304937—Oneida, 222125—Otsego, 47115 Saratoga, 12857—Tremont, 10203—Monroe, 5844—Herkimer, 5152—Albany, 4830—Tompkins, 2438—Onondaga, 1612—Chemungo, 1420 Rensselaer, 1231—Schenectay, 1990—town of Newport, N. H. 1220—Total, 749226 lbs.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 22, 1828.

EARLY CUCUMBERS.

To obtain cucumbers a month or six weeks earlier than what the soil and climate would naturally produce them is sometimes a very desirable object, especially by our market gardeners. This may be done by means of artificial heat, either in hot-beds, or hot-houses, according to rules given in treatises on gardening; but will require much labor, skill, care, and expense. Mr. Cobbett, in his *American Gardener*, paragraph 217, describes a cheap mode of raising cucumbers; by which he says, you may "have them a month earlier than the natural ground will bring them." His directions are as follows: "Make a hole and put into it a little hot dung; let the hole be under a warm fence. Put six inches deep of fine rich earth on the dung, sow a parcel of seeds in this earth; and cover at night with a bit of carpet or sail-cloth, having first fixed some hoops over this little bed. Before the plants show the rough leaf, plant two into a little flower pot, and fill as many pots this way as you please. Have a larger bed ready to put the pots into, and covered with earth so that the pots may be plunged in the earth up to their tops. Cover this bed like the last. When the plants have got the rough leaves out, they will begin to make a shoot in the middle. Pinch that short off. Let them stand in this bed till your cucumbers sown in the natural ground come up; then make some little holes in good rich land, and taking a pot at a time, turn out the ball and fix it in the hole. These plants will bear a month sooner than those sown in the natural ground; and a square yard will contain thirty-six pots, and will of course furnish plants for thirty-six hills of cucumbers, which, if well managed, will keep on bearing till September. Those who have hot-bed frames, or hand lights, will manage this matter very easily. The cucumber plant is very tender and juicy; and therefore, when the seedlings are put into the pots, they should be watered and shaded a day or two; when the balls are turned into the ground they should be watered and shaded with a bough for one day, that will be enough."

In a *Treatise on Gardening*, by J. Armstrong, of Dutchess, New York, published in *Memoirs of the New York Board of Agriculture*, we have the following passage, which suggests an important improvement on Mr. Cobbett's mode of proceeding above detailed: "To obtain early cucumbers, we

MISCELLANIES.

FLOWERS.

Now let us range both far and wide,
Through all the garden's boasted pride.
Here Jasmines spread the silver flow'ry;
To deck the wall or wave the bow'ry;
The Woodbines mix in amorous play,
And breathe their fragrant lives away
The rising Myrtles form a shade;
There Roses blush and sent the glade.
The Orange with a vernal face,
Wears every rich autumnal grace;
While the young blossoms here unfold,
There shines the fruit like pendant gold;
Citrons their balmy sweets exhale,
And triumph in the distant gale.

A PUN.

ON MISS ANN BREAD.

While toast their lovely graces spread
And fops around them flutter;
I'll be content with *Ann Bread*,
And won't have any *Dutcher*.

An incident of the name of M'Manus, who came over in one of the Belfast boats, and who has been for some time suspected of trafficking in dead bodies by the longers about the Bromelaw quay, received some very uncomplaising usage at their hands. It having been distinctly ascertained that his only merchandise, as usual was "a *lot of*" he was most unceremoniously laid hold of by the by-standers, who appeared to act in concert, and being borne in triumph to the nearest crane, a rope was fixed about his middle, and he was swung round over the river, where he hung for some minutes like the golden fleece, or *Bottle and Jar*, at Abbeid, amidst the shouts of laughter of his tormentors, and the indescribable agonies of the poor fellow's appearance. He was then rapidly lowered into the water and "sawed over head and ears." This ceremony was repeated five or six times, notwithstanding the piteous appeals of the unfortunate resurrectionist, and the attempts of some humane by-standers to release him, which was not affected until the Police arrived who conveyed him to the Office. M'Manus is the same individual who, about two weeks ago, was apprehended in Glasgow with the dead body of a child under his coat.—*Glasgow Cour.*

All men wish to be treated with respect; therefore treat all with respect, and you yourself will be respected.

Virtue is certainly the most noble and secure possession a human being can have. Beauty is worn out by time, or impaired by sickness—riches lead youth rather to destruction than to welfare, and without produce are soon lavished away. While virtue alone, the only good that is ever durable, always remains with the person that has once cherished her. She is preferable both to wealth and a noble extraction.

BY DR. A. HUNTER.

Accustom yourself to reflect.—Seek wisdom, and you will be sure to find her—but if you do not look for her, she will not look for you.

Do as you would be done by.—Use yourself to kindness and compassion, and you may expect kindness and compassion in return.

Obstinacy is weakness.—Obstinacy of temper proceeds from pride—and, in general, from ignorant pride, that refuses to be taught.

True generosity is delicately rewarded.—Blame no man for what he cannot help. We must not expect of the dial to tell us the hour after the sun is set.

Cure for Intemperance.—It has recently been discovered, that sulphuric acid, taken in spirits, completely eradicates the inclination to use them intemperately. It is said to be preferable to Chambers' remedy, being more simple, cheap, and wholly innocent.

Kindness in Sickness.—Nothing can produce more sincere admiration and heart felt gratitude, than the kind anxiety and assiduous attentions of an affectionate friend in sickness. Every tender effort to mitigate distress, accompanied by the gentle and soft accents of sympathy and love, fills the soul with emotions not to be described, even while its fragile tenement is writhing with excruciating pain! The pleasure of alleviating distress is so unalloyed, both to those who receive the kind offices of endearing humanity and esteem, and to those who cheerfully and tenderly bestow them, that every person of a reflective and ingenious mind, will cultivate this peerless virtue, by practising those acts of goodness which are attended with a reward so sweet. He who would witness a performance of the holiest rites of "pure and undefiled religion," may behold them in the patient and gentle offices of affection—bending over the bed of anguish—wetting the parched lips—cooling the feverish brow, and soothing the soul with the voice of tenderness.

From the American Advocate.

INSTINCT.

How wonderful is instinct, as we find it displayed in the numerous dumb animals—and how near, notwithstanding the boasted powers of man, does it approach to human reason! There are many instances recorded, in which brute animals have exhibited such wonderful powers as to make it very difficult to find the dividing line between instinct and what we call reason. We once witnessed such a display of this power in a duck, as convinced us that dumb animals are capable of judging as to the effect to be produced by particular action, with as much, and even more correctness than could be expected from a child of the same age. The circumstance was as follows: Being on a visit to the house of a friend, a number of ducks came near the door, a piece of dry hard bread was thrown to them. One of them, after trying for a considerable time, in vain, to masticate and swallow it, took it in her beak and carried it to a small pool of water, at a little distance from the door, into which she dropped it, and it soon became so soft, by the effect of the water, as to enable her to eat it without difficulty. Another remarkable instance of sagacity in birds, was related to us a few years since, by Rev. Dr. Harris, of Dorchester. The bird referred to, is of the *Loxia species*, and is a native of India. It constructs a pendulous nest in a very curious manner, of the grass which abounds in that country. It is suspended from a limb of a tree, in the form of a long narrow bag, and the entrance is from the bottom. The place for the deposit of the eggs is in a projection built in the side, about midway up. The reason of the bird's building in this way, is to preserve its eggs and young from the depredations of a small snake, in that country, which would destroy them. To take the eggs out of a nest constructed in this manner, the snake must first descend from the branch to which it is suspended, and when at the bottom, turn and go up. But the outside especially near the bottom, is so loosely put together, that when the snake attempts to do this, the outer filaments slip off and he falls to the ground, which is the case as often as he makes the attempt. What is more wonderful, is, that when these birds migrate during the rainy seasons, to places not infested with these reptiles, they built a common cup nest.

Numerous accounts have been given of *canine sagacity*, among which may be reckoned the one related in this paper last week in the story of "Captain Grez." Some of our readers, we are informed, doubt the truth of that story. We cannot, of course, from our own knowledge, attest to its authenticity, though from the character of the writer alone, we can hardly doubt it; for he was not in the habit of stating things as facts without satisfactory proof of their being substantially correct. We have within a short time had several remarkable instances related to us, which seem nearly as wonderful as that displayed by the dog in the story above mentioned. Rev. Mr. W—— informs us that his father, living in Worthington, owned a dog, that was particularly attached to him. He [Mr W——] was engaged to teach a school at a distance of about five miles from his father's house; and usually returned home on Saturday evening. On the second Saturday evening, the dog met him at about a mile from his father's house. This he continued thro' the winter, always meeting him at the same spot on Saturday, between seven and eight o'clock—but never, as was ascertained by several members of the family, going that way at any other time. Another instance is related by a gentleman living in this village, who informs us that he has no doubt, from several experiments lately made by him, that his dog fully understands considerable of the conversation which takes place in the family, and that he knows, as well as his children, when the Sabbath arrives, for on that day he never attempts to follow him, which he invariably does other days.

EARLY CORN, &c.

For sale at the Seed Establishment at the New England Farmer Office, a few hundred Ears of the *Early Golden Snow* Corn. This Corn was originally received from the Sioux tribe of Indians, and is considered by Mr. Prince, Mr. Derby, and other gentlemen who have tried it, to be the most profitable sort that can be raised by farmers, from its great productiveness, and from its ripening so early, as always to ensure a crop before the autumnal frosts set in. Mr. Prince usually has the new corn fit for grinding, by the first and second weeks in August. The Corn is a bright yellow, the Ears being closely filled with from 12 to 16 rows.

Also—The Early Jefferson Corn; a very early White sort, for the tables—with the common kinds of early and late Sweet Corn.

Also, every variety of Garden Seeds for hot beds, &c.—Winter Crook Neck Squash, Early Yellow Bush Squash, Early Scallop or Puttup white Bush Squash, Warty Squash, Acorn Squash, Valparaiso Squash, &c. &c.

Also a few pounds genuine *Russia* Seed.—This Seed was raised by T. Melville, Jr. Esq. late President of the Berkshire Agricultural Society, and is from superior tools, received by him from Russia a few years since.

Likewise, ESSENTIAL ROOTS AND PLANTS, FIELD AND GRASS SEEDS, POT AND SWEET HERB SEEDS, MEDICINAL HERB SEEDS, BIRD SEEDS, and more than 200 different kinds of ORNAMENTAL FLOWER SEEDS.

As to the *quantity and quality* of Seeds kept at this Establishment are far greater than at any other place in New England, orders for the British Provinces, the West India market, or the Southern States, can always be executed with promptness, at satisfactory prices. Dealers in Seeds and Country Traders supplied, at wholesale or retail on the best terms.

We have now on hand of the year's growth,

200 Lbs. Mixed Warty Seed, Sown first out singly by J. Prince, Esq.

200 Lbs. Onion Seed, Red, White and Yellow.

275 Lbs. true Blood Peas raised in Roxbury.

250 Lbs. Carrot, various kinds.

250 Lbs. Radish, superior quality.

100 bushels Peas, early and late—[We have about 50 bushels of the Early Washington Pea, which was pronounced by the few who could obtain it last year—as our supply was small—the earliest and most productive of any brought into the Boston market.]

—Catalogues of the whole Establishment with directions for cultivating the more rare and delicate seeds, comprising a pamphlet of 40 pages, furnished gratis.

—Published every FRIDAY, at *Three Dollars* per annum, payable at the end of the year; but those who pay within sixty days from the time of subscribing, are entitled to a deduction of *Fifty Cts.*

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

SCRATCHES OR SELENDERS IN HORSES.

MR FESSENDEN—I have been induced to make public through the medium of your useful paper, the results of my own practice, or experience, relating to *scratches*, or *selenders* in horses.

This disorder, or difficulty, is too well known to all who own these noble animals, or deal in them, to need a particular description of mine. The remedy is simple safe and certain, in all cases which have come to my knowledge, however inveterate. It is only to mix *white lead* and *linseed oil* in such proportions as will render the application convenient, and I have never known more than two, or three, applications necessary completely to effect a cure. A FARMER.

FOR THE NEW ENGLAND FARMER.

A Remedy for Swollen Bags of Cows, from taking Cold, or Caked by Concocted Milk.

Take the root of the herb called by several names, that is, Garget, or Pokeweed, or Cocum, or Skoke or Pigeon berry. Make three doses of two ounces, cut fine, and mixed in three sasses of mash, of wheat or rye bran and Indian corn meal, a little salt. Give a mess once in twelve hours.

And if the cow will not eat it, as some one will be the case, take two ounces of said root and boil it in water, and strain off a pail full, and when cold, set such a dose before the cow daily, confined from water and fed with dry fodder, and it rarely fails but it will be taken within twenty four hours. Three doses generally cure. If the bag can be wet over two or three times a day, with cold water, in which some Indian meal is mixed, it may be well, especially if the bag is uncommonly warm. O. P.

BROCOLI.

Directions for the cultivation of the *Cape Brocoli*; extracted from WILSON'S *Economy of the Kitchen Garden*, now in press.

This is one of our most delicious and valuable vegetable productions. In point of quality, its flowers in this country are, by good judges I believe, universally allowed at least to equal, if not to surpass those of the cauliflower. And what adds so much to its value, is, that its culture is a easy and simple as any common cabbage. It is not many years since it was first introduced into this country, and only about seven or eight years since its proper mode of culture was correctly understood. There is a number of varieties of this plant, none of which have ever been found worthy of cultivation in this country, except this. And from the many disappointments that had always attended former attempts to cultivate the other sorts, there is every probability that the too, would either never have been prosecuted successfully or attempted in any extensive degree; and it not been for the emulation excited among the members of the New York Horticultural Society, for the persevering prosecution of the culture of this valuable vegetable. Their labors have pro-

ved completely successful; but its culture still continues too much circumscribed. I will now give some information as to the proper mode of its cultivation.

There is no doubt but some little difference in the time for sowing the seed, will have to be practised in the various latitudes of the eastern and middle states. But the time being correctly known for the vicinity of New York, the others need be at no great loss to hit upon a practical calculation. Much depends upon obtaining the right sort of seed; for it has been pretty well proved by experience that there is no dependence on the success of any sort except that which is denominated the Purple Cape Brocoli. If the seed is sown too early, the plants arrive at maturity before the heat of summer is over, and over after do well; for in August they cannot flower much, and, by having to remain in a stationary state after arriving at maturity, when the proper season arrives, their having had to remain some time dormant seems to destroy their vigor, and their produce of flowers if any at all, are very inferior. And if it is sown too late, the cold attacks them before they attain that strength and firmness which it is necessary for them to possess some time before the beginning of frosty nights.

The last of August then is the proper time for the plants to arrive at maturity, and for this purpose the seed should be sown on any bed or border of common garden soil, on the fifteenth day of May. This and most other seeds sown at this season, should be trode in with the feet, and the bed smoothed lightly over with a rake. By the beginning of July the plants will be in fine order for setting out. It would not be advisable to set them out before July, for they do best when the plants are strong and of good size. So in the first week in July, prepare your ground for the plants. I have raised good crops of them both on light and heavy soils; but it is of no use to plant them in any soil unless it be in good order, and well manured, and in this case they will do on any ordinary garden ground, either old or new, although this last is their favorite. Let the ground at all events, be well manured and well dug; set the plants out in rows, two feet and a half apart, and two feet distant in the rows. It is seldom the black grub meddles much with plants set out so late in the season as this, but they must be carefully examined every morning, and wherever any are seen cut off, the grub must be hunted and killed, and the vacancy filled up from the seed bed, in which a few plants should always be left for a reserve.

The ground must be kept constantly loose and clean by frequent hoeings, and towards the end of August some of them will likely begin to flower. In the beginning of September, more will begin to show, and from the middle of the month until the middle of November they produce one continual succession of flowers. The degree of frost they withstand, without sustaining the least injury, when they are in their highest state of flowering is astonishing. The most singular characteristic of this plant, is, the great length of time which is contained between their first beginning to flower and their final termination; and that

too, from the same seed, sown at the same time and the plants all treated precisely in the same manner. Whatever plants may remain at the setting in of a settled frost, should be taken up and laid in a garden frame as directed for fall cauliflowers, and I do not think that one in a thousand would miss flowering in the course of the winter. I have frequently flowered the remainder of my whole crop in this way, and since the severe day of September last, I have never been one day without some plants being in a flowering state; and at present, (February 1828) there is no appearance of the stragglers I laid in a frame in December, stopping their blooming career.

I have had the last plant of my crop flower in April and all things considered, I am convinced that this is one of the most valuable garden productions, (the ruta baga not excepted) of any we are yet acquainted with. The mode of managing it, in order to obtain good seed here, appears to be a little more precarious; nor does it appear certain whether we shall ever be able to raise enough to prevent us from having to apply as at present to England for it. Although we are progressing bravely in our horticultural improvements, yet much remains to be achieved by future exertions.—*New York Farmer.*

CHLORIDE.

It is stated in a London paper that chloride, sold by apothecaries, under the name of bleaching salts, in small tin boxes, will certainly take out the most inveterate grease spots from a silk dress, or cotton garments. Carpets however badly be spattered by the upsetting of a lamp, can be as readily restored to their former beauty, as one can blow dust from a dry surface. For the elbows of a gentleman's best broadcloth, who unchesterfieldingly leans into a dish of gravy, or spans the breadth of his landlady's butter plate, there is nothing so clarifying. It is a white powder, which a cockney might carry in one corner of his snuff box; a little of it is to be dissolved in warm water, the spot wetted, and the grease may attend to this ordinary and extraordinary business at the same moment. Another virtue; the French say that chloride, is the most powerful disinfecting agent in nature. The bad air of cellars, yards, stables, &c. can, and indeed should be purified with it, very frequently,—as noxious effluvia is completely changed in character, wherever it has been used. To the arts, to the unfortunate owners of good clothes, and to sluts and slovens, this chloride is a rare discovery.

FLOODING OF LANDS.

Where swamp land is to be cleared, and it can be flooded, by making a dam at the outlet, at a small expense, it is a matter of economy to attend to this, as in this way its growth of wood can be completely killed. This may also be performed on lands, after they are cleared, for the purpose of killing the grass, if it be bad, in order with more ease to introduce a better kind, or a better system of culture. Flooding also serves, in a greater or a less degree, to enrich the land; though this depends chiefly on the kind of water with which it

is flooded. If it contain a rich sediment, it is good; but, if destitute of this, it is of no use.

Farmer's Assistant.

From London's Encyclopedia of Gardening.

FRUIT.

Propagation by cuttings has been long known, and is abundantly simple when applied to such free-growing hardy shrubs, as the willow or the gooseberry; but considered as the chief mode of propagating most of the ericæ, myrtæ, proteacæ, &c. becomes one of the most delicate and difficult modes of continuing the species, and fifty years ago was an operation known to very few of even the first-rate gardeners. It may be considered, as to the choice of cuttings, their preparation, their insertion in the soil, and their future management.

In respect to the choice of cuttings, those branches of trees and shrubs which are thrown out nearest the ground, and especially such as recline, or nearly so, on the earth's surface, have always the most tendency to produce roots. Even the branches of resinous trees, which are extremely difficult to propagate by cuttings, when reclining on the ground, if accidentally, or otherwise, covered with earth in any part, will there often throw out roots, and the extremity of the lateral shoot will assume the character of a main stem, as may be sometimes seen in the larch, spruce, and silver fir.—Cuttings then are to be chosen from the side shoots of plants, rather than from their summits or main stems; and the strength and health of side shoots being equal, those nearest the ground should be preferred. The proper time for taking cuttings from the mother plant is when the sap is in full motion, in order that, in returning by the bark, it may form a callus or protruding ring of granular substance, between the bark and wood, whence the roots proceed. As this callus, or ring of spongy matter, is generally best formed in ripened wood, the cutting, when taken from the mother plant, should contain a part of the former year, or in plants which grow twice a year, of the wood of the former; or in the case of plants which are continually growing, as most evergreen exotics, such wood as has begun to ripen, or assume a brownish color. This is the true principle of the choice of cuttings as to time; but there are many sorts of trees, as willow, elder, &c. the cuttings of which will grow almost at any season, and even if removed from the mother plant in winter, when the sap is comparatively at rest. In these and other trees, the principle of life seems so strong, and so universally diffused over the vegetable, that very little care is requisite for their propagation. Cuttings from herbaceous plants are chiefly chosen from the low growths, which do not indicate a tendency to blossom; but they will also succeed in many cases, when taken from the lower stems, and some rare sorts of florists' and border flowers, as the dahlia, rocket, cardinal flower, scarlet lychnis, wall flower, &c. are so propagated.

The preparation of the cutting depends on, or is guided by this principle, that the power of protruding buds or roots resides chiefly, and in most cases entirely, at what are called joints, or at those parts where leaves or buds already exist.—Hence it is that cuttings ought always to be cut across, with the smoothest and soundest section possible, at an eye or joint. And as buds are in a more advanced state in wood somewhat ripened

or fully formed, than in a state of formation, this section ought to be made in the wood of the growth of the preceding season; or as it were in the point between the two growths. It is true, that there are many sorts of cuttings, which not only throw out roots from the ring of granulated matter, but also from the sides of every part of the stem inserted in the soil, whether old and large, or young and small, as willows, currants, vines, &c.; but all plants which are difficult to root, as heaths, camellias, and orange trees, will be found in the first instance, and for several years after propagation, to throw out roots only, from the ring of herbaceous matter above mentioned; and to facilitate the formation of this ring, by properly preparing the cuttings of even willows and currants, must be an obvious advantage. It is a common practice to cut off the whole or part of the leaves of cuttings, which is always attended with bad effects in evergreens, in which the leaves may be said to supply nourishment to the cutting till it can sustain itself. This is very obvious in the case of striking from buds, which, without a leaf attached, speedily rot and die. Leaves alone, as in bryophyllum calycinum, will even strike root and form plants in some instances; and the same, as Professor Thouin observes, may be stated for flowers and fruits.

Cuttings which are difficult to strike may be rendered more tractable by previous ringing; if a ring be made on the shoot which is to furnish the cutting, a callus will be created, which, if inserted in the ground after the cutting is taken off, will freely emit roots. A ligature would perhaps operate in a similar manner, though not so efficiently; it should lightly encircle the shoot destined for a cutting, and the latter should be taken off when an accumulation of sap has apparently been produced. The amputation in the case of the ligature, as well as in that of the ring, must be made below the circles, and the cutting must be so planted as to have the callus covered with earth.

The insertion of the cuttings may seem an easy matter, and none but a practical cultivator would imagine that there could be any difference in the growth, between cuttings inserted in the middle of a pot, and those inserted at its sides. Yet such is actually the case, and some sorts of trees, as the orange, and ceratonia, if inserted in a mere mass of earth, will hardly, if at all, throw out roots, while, if they are inserted in sand, or in earth at the sides of the pots, so as to touch the pot in their whole length, they seldom fail of becoming rooted plants. Knight found the mulberry strike very well by cuttings, when they were so inserted, and when their lower ends touched a stratum of gravel or broken pots; and Hawkins, who had often tried to strike orange trees, without success, at last heard of a method (long known to nurserymen, but which was re-discovered by Luscome,) by which, at the first trial, eleven cuttings out of thirteen grew. The art is, to place them to touch the bottom of the pot; they are then to be plunged in a bark or hot-bed, and kept moist.

The management of cuttings after they are planted, depends on the general principle, that where life is weak, all excesses of exterior agency must have a tendency to render it extinct. No cutting requires to be planted deep, though such as are large ought to be inserted deeper than such as are small. In the case of evergreens, the leaves should be kept from touching the soil, otherwise

they will damp or rot off; and in the case of tubular stalked plants, which are in general not very easily struck, owing to the water lodging in the tube, and rotting the cutting, both ends may in some cases (as in common honeysuckle,) be advantageously inserted in the soil, and besides a greater certainty of success, two plants will be produced. Too much light, air, water, heat, or cold are alike injurious. To guard against these extremes in tender sorts, the means hitherto devised, is that of enclosing an atmosphere over the cuttings, by means of a hand or bell glass, according to their delicacy. This preserves a uniform stillness and moisture of atmosphere. Immersing the pot in earth, (if the cuttings are in pots) has a tendency to preserve a steady uniform degree of moisture at the roots; and shading, or planting the cuttings, if in the open air, in a shady situation, prevents the bad effects of excess of light.—The only method of regulating the heat, is by double or single coverings of glass or mats, or both. A hand glass placed over a bell glass will preserve in a shady situation, a very constant degree of heat. What the degree of heat ought to be, is generally decided by the degree of heat requisite for the mother plant. Whatever degree of heat is natural to the mother plant when in a growing state, will, in general, be most favorable to the growth of the cuttings. There are, however, some variations, amounting nearly, but not quite, to exceptions. Most species of the ericæ, dahlia, and geranium strike better when supplied with rather more heat than is requisite for the growth of these plants in green-houses. The myrtle tribe and camellias require rather less;—and in general, it may be observed, that to give a lesser portion of heat, and of every thing else proper for plants in their rooted and growing state, is the safest conduct in respect to cuttings of ligneous plants. Cuttings of deciduous hardy trees taken off in autumn should not, of course, be put into heat till spring, but should be kept dormant, like the mother tree. Cuttings of succulents, like geraniums, will do well both with ordinary and extraordinary heat.

Piping is a mode of propagating by cuttings, and is adopted with herbaceous plants having jointed tubular stems, as the dianthus tribe; and several of the grasses, and tree arundos, might be propagated in this manner. When the shoot has nearly done growing, which generally happens after the blossom has expanded, its extremity is to be separated at a part of the stem where it is nearly, or at least somewhat indurated or ripened. This separation is effected by holding the root end between the finger and thumb of one hand, below a pair of leaves, and with the other, pulling the top part above the pair of leaves, so as to separate it from the root part of the stem at the socket formed by the axilla of the leaves, leaving the stem to remain with a tubular or pipe looking termination. These pipings, or separated parts, are inserted without any further preparation, in finely sifted earth, to the depth of the first joint or pipe, gently firmed with a small dibber, watered, a hand glass placed over them, and their future management regulated on the same general principles as that of cuttings.

Large hog.—A hog was weighed at Wilmington, (Delaware) last week, the weight of which was 1,380 pounds. It is supposed that it had not yet attained its full growth.—*Penn. paper*

CELERY.

The qualities of this plant are universally known. There are three or four sorts. The white, the red, the hollow, and the solid. The solid white is the best; but the propagation and cultivation of all are the same. The whole of that part of the year, during which the frost is out of the ground, is not a bit too long for the getting of fine celery. The seed, sown in the cold ground, in April, will lie six weeks before it comes up. A wheel barrow full of hot dung, put in a hole in the ground against a wall, or any fence, facing the south, and covered with rich and fine mould, will bring the seed up in two weeks. If you have a hot bed frame, or a hand light, the thing is easy. A large flower-pot will bring up out of the ground plants enough for any family.—As soon as the plants are three inches high, and it scarcely matters how thick they stand, make a nice little bed in open free air; make the ground rich and the earth very fine. Here prick out the plants at 4 inches apart; and, of course, 9 in a square foot. They are so very small that this must be carefully done; and they should be gently watered once, and shaded 2 days.

A bed 10 feet long and 1 wide will contain 360 plants; and, if they be well cultivated, they are more than any common-sized family can want from November till May.—In this bed the plants stand till the middle of July, or thereabouts, when they are to go out into trenches. Make the trenches a foot deep and a foot wide, and put them not less than five feet asunder. The ground that you make the trenches in should not be fresh dug; but be in a solid state, which very conveniently may be; for Celery comes on just as the peas and early cabbages and cauliflowers have gone off. Lay the earth that you take out in the middle of the space between the trenches, so that it may not be washed into them by the heavy rains; for it will, in such cases, cover the hearts of the plants, and will go very nearly to destroy them. When you have made your trench, put along it some good rich compost manure, partly consisting of wood ashes. Not dung; or, at least, not dung fresh from the yard; for, if you use that, the celery will be rank and pipy, and will not keep nearly so long or so well. Dig this manure in, and break all the earth very fine as you go. Then take up your plants, and trim off the long roots. You will find, that every plant has offsets to it, coming up by the side of the main stem. Pull all these off, and leave only the single stem. Cut the leaves off so as to leave the whole plant about six inches long. Plant them, six inches apart, keeping, as you are at work, your feet close to the outside edges of the trench. Do not water the plants; and, if you plant in fresh dug ground, and fix your plants well, none of the troublesome, and cumbersome business of shading is at all necessary; for the plant is naturally hardy, and, if it has heat to wither it above, it has also that heat beneath to cause its roots to strike out almost instantly. When the plants begin to grow, which they quickly will do, hoe on each side and between them with a small hoe. As they grow up earth their stems; that is, put the earth up to them, but not too much at a time; and let the earth that you put up be finely broken, and not at all cloddy. While you do this, keep the stalks of the outside leaves close up to prevent the earth from getting between the stems of the outside leaves and the inner ones; for, if it get there it

checks the plant and makes the celery bad.—When you begin the earthing take first the edges of the trenches; and do not go into the middle of the intervals for the earth that you took out of the trenches. Keep working backwards, time after time, that is earthing after earthing, till you come to the earth that you dug out of the trenches; and, by this time the earth against the plants will be above the level of the land. Then you take the earth out of the middle, till, at last the earth against the plants forms a ridge & the middle of each interval a sort of gutter. Earth up very often, and not put much at a time. Every week a little earth to be put up.—Thus, in October, you will have four ridges of Celery across one of the plots, each containing 168 plants. I shall suppose one of these ridges to be wanted for use before the frost sets in for good. Leave another ridge to be locked up by the frost, a much safer guardian than your cellar or barn floor. But, you must cover this ridge over in such a way that the wet will not get down into the hearts of the celery. Two boards, a foot wide each, their edges on one side laid upon the earth of the ridge, formed into a root over the point of the ridge, the upper edge of one board going an inch over the upper edge of the other, and the boards fastened well with pegs, will do the business completely; for, it is not the frost, but the occasional thaws that you have to fear, and the wet and rot that they produce. For the celery that is to serve for a setting in to the breaking up of the frost, you must have a bed of sand, or light earth, in a warm part of a barn, or in a cellar; and there you must lay it in, row after row, not covering the points of the leaves. To have seed, take one plant, in spring, out of the ridge left in the garden. Plant it in an open place, and you will have seed enough to serve a whole township. For soup, the seed bruised is as good as the plant itself.—*Cobbett's Gardener.*

CANKER IN FRUIT TREES.

Canker, in a great measure, arises from animalcules, or small or very minute insects or worms, of various kinds; where this is the case, cut out the whole of the cankered part, clean to the sound wood, wash the part well with the following solution, and also all other parts that seem to be in the least affected; then gives it a light coat of the medicated tar.

The medicated tar, is composed of half an ounce of corrosive sublimate, reduced to a fine powder, and then put into a three pint earthen pipkin, with about half a gill of gin, or other spirit, stirred well together, and the sublimate thus dissolved. The pipkin must then be filled by degrees with common tar, and constantly stirred till the mixture is intimately blended. This quantity will be sufficient for two hundred trees. Being of a very poisonous nature, it should not be suffered to lie carelessly about the house. The sublimate dissolves better, when united with the same quantity of the spirit of hartshorn, or sal ammoniac. This mixture being apt to run, consistency may be given it, by mixing it with either powdered chalk, or whiting.

The above composition will be found eminently useful, as no worm of any kind, can live near its influence, and no evil whatever will arise to the trees from its poisonous quality; it yields to the growth of the bark, and affords a complete protection to the parts against the influence of the weather.

Dissolve a drachm of corrosive sublimate in a gill of gin or other spirit, and when thus dissolved incorporate it with four quarts of soft water. This solution will be found to be the most effectual remedy ever applied to trees, both for the destruction of worms of every species and of the eggs of insects deposited in the bark. No danger to the trees is to be apprehended from its poisonous quality, which, in respect to them, is perfectly innocent.

Peach trees, which are annoyed by worms, should, towards the end of this month, particularly near, and a little under the surface of the ground, be carefully examined, and where any are found, they must be picked out with the point of a knife, and with as little injury to the bark as possible; for, by lacerating the rind or bark in a careless manner, which is too frequently the case on these occasions, this vehicle, which nature has provided for carrying up the nourishment extracted by the roots, being destroyed, the trees must of course perish, or be weakened in proportion as it is injured.

This being done, wash all the trunks or stems of the trees, as well as any other parts in which you suspect these vermin or their embryo eggs to be lodged, with the above solution, and also the wounded parts; after which, apply with a brush a slight dressing of the medicated tar to each and every of the wounds inflicted by picking out the worms. This will preserve your trees in health and fruitfulness much longer than if left to the mercy of these destructive intruders.

As to manure, it is well known that where hogs and poultry are constantly running over the ground, the trees seldom fail of a crop, which is the best proof that manure is necessary. Any manure will suit an orchard; but the sweepings of cow houses, hog pens, slaughter houses, poultry and pigeon houses, emptying of drains, &c. are more disposed to facilitate the growth and promote the health of fruit trees, than stable manure. However, any kind of manure is better than none at all.—*W. Mahon's Gardener.*

DOCK.

I have frequently mentioned the leaves of this weed as being sold in the market at New York.—This weed and the Dandelion are the gardener's two vegetable devils. Nothing but absolute burning, or a sun that will reduce them to powder, will kill their roots, any little bit of which will grow, and that, too, whether lying on, or in, the ground. Both bear seed in prodigious quantities. The Dock (which is the wild Rhubarb) puts forth its leaves very quickly after the Dandelion; and hence it is that it is resorted to as greens in the spring. This is, however a coarse green compared with the Dandelion. However, it is better than no greens at all, after five months of winter, which has left nothing green upon the face of the earth. If a rod or two of ground, on the south side of a wood, were trenched and made rich, and planted with Docks, or Dandelions, the owner, even tho' he had no garden, would not be in want of early greens; and, it would be better to do this than to have to go upon the hunt after these vegetables, which, though weeds, are not, in every place, to be found in any considerable quantity; or, at least, not without spending a good deal of time in the pursuit. The Dock-leaf is very wholesome, as is also that of the Dandelion. They do not produce gripings as the greater part of the cabbage kinds are apt to do.—*Cobbett.*

GRAPES.

[Continued from page 245]

19. *Black Muscadet of Alexandria*.—This is similar to the above, in its general properties, except in point of color, which, as its name indicates, is black. I consider this the same as the Black Muscadet and Black Malaga.

21. *Viorose, or Le Cœur*.—The berries are unequal in size, of a heart shape, and violet color, forming very large bunches; every part of the plant indicates a vigorous state; the leaves are large, and deeply indented; it is not considered as a very high flavored fruit, and should have a warm situation.

56. *Corvish n, or Cucumber Grape*.—This is a grape of peculiar form, whence its name; it is very long, swelled in the middle, and pointed at the ends; the berries are not closely set, but the bunch is of good size, and composed of many divisions; the fruit is sweet, and of fine flavor; the usual color is white or yellow, but there is a red variety.

60. *White Seedless Corinth*.—This is the smallest grape I have ever seen; white, round, sweet, and of a delightful flavor; its size, appearance, and being seedless, make it particularly interesting; the bunch is long, winged, and regularly formed, the berries not being too compressed; it ripens early in September, and is said to be the grape which produces the Sultan Raisins.

58. *Black Hamburg*.—It is this grape which is sometimes called the Hampton Court Vine, and which is recorded by Miller to have produced on that vine a ton weight of grapes in a single season. It is considered in England as one of the most uncertain to ripen out of doors.

At Boston it is cultivated to a very considerable extent, but principally in grape houses of a cheap construction. The markets of Boston are supplied with large quantities of the fruit, and the bunches average from one to one and a half pounds, and some have weighed two pounds. The Hon. John Lowell, of Roxbury, (near Boston) has done much towards facilitating the extensive culture of this grape in that section of the Union, by erecting an extensive grape-house on a cheap construction, thus demonstrating the facility with which success may be insured. In the vicinity of New York, and south of it, this grape will need no such attendance, however, as it will mature its fruit in the open air. This grape, which is black, and inclining to oval, is remarkably fine flavored; both the berries and bunches are extremely large, the latter being shouldered—the only fault is that the skin is rather thick; it is a great bearer, and much esteemed for that and its other qualities; ripens in September.

59. *Red Hamburg, or Gibraltar*.—The berries are dark red, thick skin, flesh juicy and delicate; the shape of the berry and form of the bunch both resemble the foregoing.

11. *Purple Malvica*.—This is a small pale purple grape, loosely set on long bunches; they have a vinous perfume and flavor when ripe, but are not suitable for the table.

21. *Brown, or Chocolate*.—This was received from France about thirty years since; the vine is of very vigorous growth, and a great bearer, and seems to suit our climate well, and to be as hardy as our native wild grape; the fruit is oval, of a sprightly flavor, and the bunches large; it is an excellent wine grape, but in this vicinity ripens late, being at the end of September.

42. *Red Muscadet*.—The berries are very large, oval, of an equal size throughout the bunch, and of a beautiful red color; the skin is thick, and the flesh hard.

136. *Tenturier, or the Dyer*.—This grape has characteristic distinctions, not only in the form of its fruit and leaves, but also by the very deep red color of its juice; the bunches are irregular, and with shoulders; the berries round, and of unequal size; the leaves deeply incised, and five lobed. It is cultivated for the coloring of other wines and to dye silks of a deep red color. The wine, when made separately of this grape has a harsh and disagreeable taste; the berries are black, and of a round form. It has no less than ten names, Tin-can, Gros Noir, Noireau, &c.

79. *Black Spanish, Alicante, or Gros Noir d'Espagne*.—This grape has some resemblance to the preceding in the color of its juice, but it is of a quality greatly superior for wine; both the berries and the bunches are larger, the wood stronger, and the leaf more broad. It is this grape from which port wine is made.

Gros Muscadet.—The color of this grape is very peculiar, being between a white and a rose color; the bunch is of moderate size, as well as the fruit, which is extremely sweet and luscious; it yields well, and the fruit ripens early in September. I consider it one of the most desirable grapes for the table which ripen at that period.

97. *Molier*.—This grape, whose bunches of fruit at first view much resemble the Chasselas, and which in fact, is called by that name in some vineyards of France, differs from it, however, in many respects. The fruit, which is yellowish, often contracts a russet appearance next the sun; its berries are round, not closely set, and ripen pretty well even in the north of France; its juice is pleasant and sweet; the leaf is quite palmated. This grape, the author considers, as nearly approaching the White Muscadine, and may possibly prove the same.

72. *White Sauvignon*.—Formerly many vineyards were almost wholly formed of this grape, but it is now more rare. Its high flavor gives to the wine a particular character, but being less productive, it has been latterly much neglected; the bunches are short, of medium size, and the berries yellowish white, with small dots when fully ripe; it is considered to be a variety of the Pineau or Burgundy.

Rochelle Noire.—This is a round black fruit, pretty pleasant to the taste, but in France principally cultivated for wine. It is remarkable for its elegantly formed leaves, of a fine green above, and downy beneath. The Rochelle Blanche is similar to this, with the exception that the fruit is white.

238. *Perle*.—The berry is oblong, large, and white; the bunches have many small shoulders, and it would seem that it with difficulty supports the grapes which give it an oblong form.

212. *Folle Blanche*.—This grape is of medium size, thin skin, and berries closely set. Even when at perfect maturity it has a sweetish acid flavour not considered pleasant. It generally yields a great abundance, and is in high repute for making brandy; the berries are round and whitish.

77. *Ferjus, or Bordetais*.—This grape does not ripen in the north or middle of France, but in the vicinity of Bourdeaux, it comes to perfect maturity; the berries are oblong, quite large, and form very large divided or winged bunches; is consid-

ered of value in the vineyards to mingle with other grapes; the leaves are large, and particularly sensible to frost. This grape, it is expected, will suit our country south of the Potomac.

From the London Morning Chronicle.

MANUFACTURES.

Under this head there is little new to state. The accounts from the manufacturing districts, are, for the season of the year, favorable; and notwithstanding the complaints among merchants and manufacturers, the entries of the Custom-house are by no means inconsiderable. Among the latest entries, are very extensive quantities of linen, and cotton manufactured goods, [particularly cotton lace] silks, and indigo; of the latter, much is sent to Hamburg, where the demand continues to be steady. There have been a fair number of entries for exports of British manufactured goods to New York; but the quantity of cotton goods for that market, diminishes sensibly; this is probably owing to the increase of cotton manufactures in Massachusetts, and other parts of the U. States. At some of the cotton mills, not less than 12 to 1300,000 yards of cloth were produced—a large quantity, under such circumstances. These mills are said to be well managed, and the encouragement given by the Americans to their native manufactures, is such, that it is to be feared the United States will soon be independent of this country for cotton manufactures. An English manufacturer, who has just returned to England from the U. States, arriving at Havre de Grace, and proceeding to Calais by Rouen, has supplied some interesting details of the comparative merits of French and American manufactures. This gentleman declares, that at Lowell, in Massachusetts, the manufacturers are able to produce better printed cottons, at 1s. 8d. per yard, than the Rouen manufacturers can produce at 2s. 1d. He declares that whilst the French are unable to produce cotton goods so cheap as the English by 15 or 20 per cent., the Americans are already able to compete with us in many articles, even with so small a difference as 4 to 5 per cent. He speaks very favorably, however, of the French dye, and observes, that in the brilliancy and durability of color, the Americans have yet much to learn.—However, as they are establishing many chemical laboratories, and offering good encouragement to practical chemists, it is not doubted that they will soon arrive at perfection.

The brig Ganges, about to sail hence for the Pacific, furnishes a fact which is worthy of notice. Her cargo consists of about eight hundred bales of domestic cotton goods, chiefly of Baltimore manufacture, the value of which, in this market, is little, if any, short of one hundred thousand dollars! This is the export of a single vessel only, and affords a happy presage of what Baltimore is destined to become, when the Rail Roads shall call all her manufacturing and other resources into full operation.—*Baltimore American*.

A gentleman yesterday shewed us a ripe Pear the growth of this season. The Pear is, we believe, a delicate fruit, and is early blighted by the cold. It evidences the very great singularity of the season, that it should have been raised to maturity, without any peculiar cultivation, and in the open air.—*Charleston paper Feb. 5.*

From Cobbet's American Gardener.

FLOWERS AND ORNAMENTAL GARDENING IN GENERAL.

GERANIUM.—This is but *hardiness only*, to make it the finest flower-plant of which I have any knowledge. Some give us flower with little or no leaf; others have beauty of leaf as well as of flower, but give us no fragrance. Others, like the rose, give us this added to beauty of flower and of leaf, but it gives us them only for part of the year. The geranium has a beautiful leaf, beautiful flower, fragrant smell from leaf as well as from flower, and these it has in never ceasing abundance; and, as to variety of sorts, as well in leaf as in flower, it surpasses even the flower of the auricula. How delightful the country, where geraniums form the under-wood, and the myrtles tower above. Softly, my friends! beneath that under-wood lurks the poisonous lizards and serpents, and through those myrtle boughs the deadly winged adders rustle; while all around is dry and burning sun! The geranium is a native of the south of Africa; and, though it will not receive its death blow from even a sharpish frost, it will not endure the winter, even in the mild climate of England. But, then, it is so easy of cultivation, it grows so fast, blows so soon, and is of so little trouble, that it seems to argue an insensibility to the charms of nature not to have geraniums if we have the means of obtaining earth and sun. The geranium is propagated from seed, or from cuttings. The seed, like that of the auricula, does not produce flower or leaf like the mother plant, except by chance. It is easily saved, and for curiosity's sake, may be sown to see if a new variety will come. But a cutting, from any part of the plant, old wood or young wood, stuck into the ground, or into a pot, will grow and become a plant, and will blow in a month from the time you put it into the ground. You must have plants, in deed, to cut from: but these may be, in small number at any rate, in a window, during winter. When the spring comes, cut them up into cuttings, put these in the ground where you wish to have plants during summer. They will be in bloom by July; and, before October, will be large as a currant tree. Take off cuttings from these during September, put them in pots, and they are ready for the next spring. If you have a greenhouse, you may have geraniums in full bloom all the long dreary winter.

GUELDER ROSE.—This is called here the snow ball tree. It is raised either from layers or suckers. Its bloom is of short duration; but, for the time, makes a grand show in a shrubbery. The suckers of it ought to be dug clean away every year.

HAWTHORN.—This tree has been amply described. Sometimes it is called hawthorn, and sometimes white thorn.

HEART'S-EASE, OR PANZY.—A beautiful little annual, which has great varieties, and all of them pretty. It blows all the summer. It may be sown in the fall, without any care about covering the ground; but it must not come up, till spring.

HEATH.—The common English heath is hardy, but ugly. The heaths from Africa, are of infinite variety. Insignificant in flower, however, and must be housed in winter. They are propagated from seed or from slips, and will last a long while. A few in a green-house are pretty; and they look gay in winter.

HOLLYHOCK.—This is a fine showy plant for a shrubbery. There are double and single, and none but the double should be cultivated. It may be raised from seed, or from offsets. If the former, it does not blow till the second year. It will remain in the ground many years, and is perfectly hardy.

HOLLYHOCK, (Chinese).—This is a more tender and far more beautiful kind than the common. It is raised from seed only; blows the second year, and *only* that year. It is, therefore, a *biennial*.

HONEYUCKLE.—This, amongst all Eng. shrubs, is the only rival of the rose; and, if put to the vote, perhaps as many persons would decide for the one as for the other. Its name indicates its sweetness of taste, and the smell is delightful almost beyond comparison. The plant is also beautiful—it climbs up houses, and over hedges—it forms arbors and bowers—and has a long continued succession of blossoms. It grows wild in all parts of England, in many parts covering the hedges and climbing up the trees. There is little variety as to sorts. That which is cultivated has a larger and deeper colored bloom, but the wild has the sweetest smell. It may be propagated from seed; but always is from cuttings; put into the ground in the spring, and treated like other wood cuttings.

HYACINTH.—This is a bulbous rooted plant, and like all the plants of that class, is *biennial*. It may be raised from seed; but, as in the case of the auricula and many other plants, it is many chances to one, that out of a whole bed, you do not get a good flower; and, perhaps it is a hundred to one that you do not get a flower to resemble the mother plant. Therefore, none but curious florists attempt to raise from the seed.—The roots are propagated from offsets; that is to say, the mother root while it is blowing, sends out, on its sides, several young ones. The old root, young ones and all, are put away in a dry place, out of the reach of severe frost, till spring. Then, when you plant the old ones out to blow again, you take off the young ones and plant also. They do not blow the first year, and if weak, not the second. But in time, they do; and then they produce offsets. This is the way the hyacinth is multiplied. It is a fine and fragrant flower; it blows early, but will blow well even in glasses in a room; but better in earth. A fine flower for a green-house where it would be out in full bloom while the snow was on the ground.

JASMIN.—Has the merit of a very delightful smell, and that only. Its leaf and flower are insignificant. It climbs, however, and is good to cover bowers, it is easily raised from cuttings.

(To be continued.)

TURKEYS.

These birds are naturally inclined to ramble and will therefore thrive best in open countries, where there is not much shelter to harbor vermin. They are of a very tender constitution, and while young must be carefully watched and kept warm; for the hens are so negligent, that while they have one to follow them, they will never take any care of the rest. Some people, where they have the convenience of a small covert near the house, let them take their liberty, and seek their own nests; but it is only in particular places that they do well with such management.

Turkeys are great feeders of corn, and if kept on it, will devour a great quantity; but if left to

their liberty when grown up, they will get their own living, by feeding on herbs, seeds, &c. as they are very apt to straggle, they will often lay their eggs in secret places, and therefore the common sort of them must be often watched, and compelled to lay at home. They begin to lay in March, and will sit in April; but they should not be suffered to sit on more than eleven or thirteen eggs at most. When they have hatched their brood (which will be in between twenty-five and thirty days) you must be particularly careful to keep the young ones warm; for the least cold will kill them. They must be fed either with curds, or green fresh cheese cut in small pieces; and let their drink be new milk, or milk and water. Some give them oatmeal and milk boiled thick together, into which they put wormwood chopped small, and sometimes eggs boiled hard, and cut in little pieces. They must be fed often, for the hen will not take much care of them;—and when they have got some strength, feed them abroad in a close walled place, where they cannot stray; you must not let them out till the dew is off the grass, taking care to have them in again before night, because the dew is very prejudicial to their health.

If you fatten turkeys, give them sodden barley or sodden oats for the first fortnight, and for another fortnight cram them as you do capons. They are only to be crammed in the morning, which must be given to them warm, and let out all day, being sometimes fed with corn while out; because, as they are sullen birds, they will other wise be apt not to fatten so kindly.

Turkeys' eggs are not only reckoned very wholesome, in general, but will likewise greatly contribute to the restoring of decayed constitutions.

EXPERIMENTS.

There is no way of making improvements in farming, but by experiments. If the farmer is informed of, or has conceived, a different and better method of culture, or management, in any branch of his farming, he is to test the goodness of that method by experiments; and, if these prove successful, he may congratulate himself, on having performed an act which is serviceable to his country and honorable to himself.—*Farmer's Assisist.*

Extraordinary Season.—We saw, on Sunday last, a Nosegay, consisting of the following flowers: A full blown white Hyacinth, two kinds of Violets, Blooming Box, Daffodil, Wall Flowers.—These flowers are now unprotected from the weather in the garden of Mr. C. C. Welford, of this town.—*Charleston, (S. C.) pa.*

Ireland it seems, is surpassing England in the concection of magnificent projects. A ship canal from Kensington-harbor, Dublin, to Galway Bay is in contemplation; the estimated expense is £5,486,400, and like the intended ship canal from London to Portsmouth, is announced to the public as under the patronage of dukes, marquises, earls, &c.

Negroes.—Blumenbach gives a most interesting account of a little library which he possesses of works written by Negroes, from which it appears that there is not a single department of taste or science in which some Negro has not distinguished himself.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 29, 1828.

SUGAR BEET.

A vegetable which promises to prove useful both for field and garden culture has lately been introduced into this country, but its properties appear to be but little known. The plant to which we allude is commonly called the Sugar Beet, and sometimes the Bonaparte Beet. This last appellation was given to the root in consequence of its having been extensively cultivated in France for the purpose of making Sugar, by the direction of Bonaparte. It is a species of the same genus with the common garden beet, [*Beta vulgaris*] but we cannot learn that it is distinguished by botanists, by any specific name. Some writers on agriculture have confounded the Sugar Beet with the Mangel Wurtzel,—but the plants differ in many essential qualities. The Sugar Beet grows to the same size as the Mangel Wurtzel, is of greater specific gravity, or heavier in proportion to its bulk, and is a much sweeter root. If it contains nourishment in proportion to its saccharine matter, it will, perhaps, be found a more profitable root for field cultivation than the Mangel Wurtzel. Further experiments, however are wanting, before the relative value of these roots can be stated with certainty.

Mr Bartley, Secretary of the Bath Agricultural Society, England, informed Dr Mease that the White Beet or Mangel Wurtzel, (probably meaning the Sugar Beet,) is very easily cultivated in a deep mellow soil. He made some trials of this root, from which it resulted that 16 lbs of the root will produce about 1 lb. of concrete sugar, and that the maximum crop of an acre of ground might produce, at least, two tons weight of sugar, or forty tons of the root, in drills three feet asunder, with plants eighteen inches distance in the rows. He obtained roots weighing upwards of sixteen pounds each.

Mr Margraaf, a famous chemist, made some experiments, published in 1747, for determining the quality of sugar contained in various European plants, and found the White or Sugar Beet produced a much greater quantity than any of the other plants. Dr Achard of Berlin first introduced this subject into notice, and recommended that the sugar should be procured by boiling the roots, slicing them when cold, pressing out filtering or straining and evaporating the juice. He observed that crude sugar might thus be produced for about three pence a pound. Dr Achard reckons three varieties of the beet, but preferred that which has the skin of a reddish colour and the flesh white. He forbids all transplanting; and one of the reasons for the prohibition is, that the lower parts or points of the roots are liable to be thus broken off, which part, he says, gives more sugar than the upper part. The process pursued by Dr Achard in making sugar from these roots is given in Dr Rees's Cyclopaedia, Art. Beta, and is too long to copy here.

The refuse of the roots, after the sugar is extracted, may, it is said, be used as a substitute for coffee, after a due preparation. And the Domestic Encyclopedia states that this refuse is more profitable for feeding cattle than the roots themselves. We apprehend that the Sugar Beet may contain too much saccharine matter to be used for the purpose of feeding cattle, without being mix-

ed with other substances, such as hay, cut straw, &c. in a greater proportion than what is necessary in feeding with roots which have less sweetness. But with a proper mixture of such substances, we have no doubt but sugar beets would furnish much more nourishment for cattle, in proportion to their weight than any other vegetable, which our soil and climate will afford. On this subject however, we have nothing but conjecture and analogy on which to found our observations. We wish merely to furnish hints, and state probabilities. Experiments, accurately made, and faithfully recorded, can alone enable agriculturists to determine decisively the precise value of this root, as an article of field culture.

According to a "Table of the quantities of nutritive matters afforded by 1000 parts of different vegetable substances," published by Sir Humphrey Davy, (see Agricultural Chemistry, page 131) the whole quantity of nutritive matter contained in 1000 parts of the red beet, amounts to 141 such parts—in the white beet to 136—in the parsnip to 93—the carrot to 98—the common turnip to 42, &c. The white beet is one of the varieties of the sugar beet, and according to the table alluded to contains more than three times the quantity of nutritive matter which is contained in the common or English turnip. The stomachs of cattle, however, may not, perhaps, produce results exactly like what might have been expected from chemical analysis. Bulk as well as nutritive matter is requisite in food for cattle, in order to give the stomach its due degree of attention. It is necessary that their bellies should be filled, and nutritious matter, in a very concentrated form, might not perhaps, so well answer the purposes of nature in the growth and fattening of the animals, as would the same matter if diffused through a larger bulk of food. For these reasons we should believe, as before observed, that other substances should be mixed with the beets in feeding cattle.

John Prince, Esq. of Roxbury, Mass. imported some time since, some of the seed of the sugar beet, from Paris, and has left some of it for sale at the office of the New England Farmer. He has been very careful to prevent its being adulterated by mixture with other sorts of beet, having set his seed plants at such a distance from the seed plants of other beets, that the farina of each could have no effect in changing or deteriorating the kind.

Mr Prince's experience in cultivating both the Mangel Wurtzel and the Sugar Beet, for a number of years, has induced him to prefer the latter. It is not only sweeter and more nutritive than the Mangel Wurtzel, but may be preserved from decay, rotting or deterioration with more facility.—N. E. Farmer, vol. iii. p. 392

Although we have heretofore published the substance of the above notices, we are induced to reprint them for the benefit of recent subscribers, and to add that further experience and observations of Mr Prince and other cultivators, with regard to this root, have confirmed its reputation; and it is now thought by many, to be the best and most profitable root crop which our soil and climate afford, to reward agricultural industry.

ECONOMY.

M. Say, a celebrated French writer on political economy, has the following story: "being in the country, I had an example of one of those small losses which a family is exposed to, through neg-

ligence. From the want of small value the wicket of a barn-yard, [looking to the fields] was often left open; every one who went through drew the door to, but having no means to fasten it, it remained flapping; the poultry escaped, and were lost. One day a fine pig got out and ran into the wood, and immediately all the world was after it; the gardener—the cook—the dairy maid, all ran to recover the swine. The gardener got sight of him first, and jumping over a ditch to stop him, he sprained his ankle, and was confined a fortnight to his house. The cook on her return, found all the linen she had left to dry by the fire, burned; and the dairy maid having run off before she tied up the cows, one of them broke the leg of a colt in the stable. The gardener's lost time was worth twenty crowns, valuing his pain at nothing; the linen burned, and the cloth spoiled, were worth as much more. Here is a loss of forty crowns, and much pain, trouble, vexation, and inconvenience, for the want of a latch, which would not cost three pence; and this loss, through careless neglect, falls on a family little able to support it."

LUCERNE.

This plant may be sown from the beginning of April to the end of May, but the best time, if the weather be dry, is in May. The usual allowance for sowing is about 20 lbs. to an acre. To make hay it should be mowed as soon as the bloom appears, or rather sooner; it must not be spread like common grass, but lie in the swath like clover, and turned in the same manner, or the leaves which are most nutritive will drop off. The hay is good for all sorts of cattle; and when horses are fed with it they should not have their full allowance of corn; the Lucerne, in a great measure answers the purpose of both corn and hay. It is also the most profitable of any sort of fodder to feed horses with in summer, by mowing and giving it to them green. If the land is good, the produce is incredible; and according to the goodness and depth of the soil, so will the crops be.—One acre, if it takes well, is supposed to keep 3 horses all the year. It purges in spring, and will make any cattle fat in a few days.—*Complete English Farmer.*

Employment of Bones as Manure.—The Chevalier Masclet has addressed a letter to M. Matthieu de Dombasle on this subject, stating how much he was struck with the advantages of manuring with bones, in a tour he lately made in Scotland. He found them equally effective on sandy and clayey soils, and that their benefit was felt for thirty years. On humid and calcareous soils they are of little use; but on grass lands they are beneficial.—(*Annal. de l'Agric. Franc. Nov. 1825.*)

Bees.—Where the buck-wheat, or, more properly, beech-wheat, *Polygonum f. gopyrum*, is extensively cultivated, there bees collect beautiful wax and bad honey; where the saintfoin abounds, there the honey is delicious, but the wax is very difficult to bleach.—(*Ann. de l'Agric. Franc. t. 81.*)

American Aoc.—A superb specimen flowered in September last, (1825) in the garden of E. P. Bastard, Esq. M. P. at Kitley, upwards of 2000 flowers, arranged on whorls of horizontal branches, so as to resemble an immense caducelabra.—The plant is 110 years old, and is known to have been in the Kitley gardens upwards of a century.

To destroy the Weevil among Corn.—Lay fleeces of wool which have not been scoured, on the grain; the oily matter attracts the insects among the wool where they soon die, from what cause is not exactly known. M. B. C. Pyrandeau related to the Philomathic Society of Paris, that his father had made the discovery in 1811, and had practised it on a large scale since.—Bull. des Sciences.

Several pounds of sewing silk, of an excellent quality, have been offered for sale in Cincinnati, Ohio. This silk was raised in Sandusky, by Mr William Butler. The soil and climate of Ohio are said to be very favorable for the growth of the mulberry tree and the silk worm.

The crop of sugar in Louisiana has this year been very abundant. It is estimated at 60,000 hhds.—some say more. The molasses will of course be 30,000 hhds

A London paper gives a letter from Madrid, stating that the government of the United States had offered the Spanish government a pecuniary consideration, for certain privileges for its merchant ships in the Island of Cuba.

It was feared for some time that the Thames Tunnel Company would not be able to proceed for want of funds, but they have obtained a loan from government sufficient for completion, at an interest of two per cent.

A church has been commenced at Moscow, in Russia, on a scale of stupendous magnitude—it is said that its height, when completed, will be 770 feet.

Strindling Balanced.—While Snelson was on his way to England with the money he had purchased from the Bank of Virginia, Collet and Jones were making a trip to America, with a large amount of property fraudulently obtained in England. They have been arrested and imprisoned at New York. Among other effects found in their possession, were three thousand sovereigns.

A reverend sportsman was once boasting of his infallible skill in finding a hare. "H," said a quaker who was present, "I were a hare, I would take my seat in a place where I should be sure of not being disturbed by thee, from the first of the 1st mo. to the last of the 12th mo."—"Why, where would you go?" "Into thy study."

After the battle of Navarino, lord Cochrane issued a proclamation, declaring all Greek vessels under 100 tons, that were found armed, should be treated as pirates.

Shrubs in full leaf were seen in Philadelphia last week; the willow, lilac, and elder trees appear in great forwardness. [The same forwardness has been observed in the vicinity of Boston the present week.]

A radical cure.—The following item was delivered in a farmer's bill, to a gentleman in the neighborhood of Bristol, a few days since:—"To curing your honor's mare till she died"—12s. 6d."

The Philadelphia Aurora states, "that \$54,000 of the United States appropriation for soldiers' pensions, have been unclaimed—partly owing to the death of some of the pensioners, of which no return has been made to the War or Treasury Department.

JAMES BLOODGOOD & Co's. Nursery, at Flushing, on Long Island, near New York. IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists, who may be desirous of stocking their gardens and fields with Fruit Trees of the finest sorts, and most healthy and vigorous stocks the present season.

Bloodgood & Co. attend personally to the Pauculation and Encouraging of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove good. The subscriber, Agent of the above Nursery will receive orders for any quantity of:

FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him.

The reputation of this Nursery is so extensively known, and has been so well sustained, that I take leave to refer those in want of Trees, to any of the Horticulturists in this City and its vicinity; and if peculiar demonstration is desired, I invite those who wish to be thus aided, to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis, on application to ZEB. COOK, Jr. Rogers' Buildings—Congress St.

TREES. N. DAVENPORT offers for sale at his Nursery, in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Pears, Peaches, Plums, Nectarines, &c. Gooseberry and Currant Bushes. A list of which can be seen at the office of the New England Farmer, or Agricultural Warehouse—and will be inserted in the New England Farmer occasionally. At this Nursery, however, it is so much an object to present the imposing display of a great number of the names of numerous fruit as to keep a choice collection of those sorts, whose excellence is well known and established. Orders are respectfully solicited, and will receive prompt attention if left with J. R. NEWELL, at the Agricultural Establishment, No. 52 North Market-street; or with FLEMING & DAYTON, No. 73 Washington Street—or at the Nursery in Milton. Feb. 29.

LOU DON. FOR sale at the Office of the New England Farmer, one copy of "An Encyclopedia of Gardening, comprising the Theory and Practice of Horticulture, Floriculture, Arboriculture, and Landscape Gardening, including all the latest Improvements, a General History of Gardening in all Countries; and a Statistical View of its Present state, with Suggestions for its future progress." The above work is illustrated with eight hundred engravings; handsomely bound in three octavo volumes—price \$1.00 per vol.—third edition. The merits of this extraordinary and invaluable work are too well known to require comment.

FARM WANTED. Any person having a large and good farm, that is capable, and does make, not less than one hundred tons of good hay, with a suitable proportion of tillage and pasture land, and a good supply of wood and orcharding, with good buildings, and a pleasant and healthy situation, as to good neighborhood, (and not exceeding 40 or 50 miles from Boston, with a description thereof, (postage paid) and the lowest price and terms of payment, to A. Z. Care of Mr Russell, publisher of the New England Farmer.

NEW ZEALAND SPINACH AND SUGAR BEET, &c. Just received for sale, at the Seed Establishment, New England Farmer office, a small quantity of the New Zealand Spinach, the first ever introduced into New England; it is particularly account of this vegetable will be found in the New England Farmer, page 116 of the current volume, by a member of the New York Horticultural Society. Likewise, English Patience Dock, for early greens.

Also, 200 lbs. genuine Sugar Beet, raised, with much care, by John France, Esq. Roxbury. A large variety of fresh Garden Seeds, suitable for sowing of Hot Beds, among which are Bush-Sweet Marjoram, Early Camperdown Lettuce, Silesia do. Head do. Royal Cape do. Tomshall do. Ice-Cress do. Green and White-Cress do. Early York Cabbage, Early Penton do. Early Battersea do. Early Sugarbeet do. Early Dutch do. Green Globe Savoy do. Cape Savoy do.—Early White, Purple, and Cape Broccoli—Early and Late Cauliflowers—White and Rose-colored Celery—Curled Cress—Early France Cucumber, Green Cluster do. Long Green and White Turkey do. Long Prickly do. White Spined do. Short Prickly do.—Green Citron Melon, Pine Apple do. Minorea do.—Purple Egg Plant—Superior Short Top Scarlet Radish, Early Frame do. Cherry do.—Early White Dutch Turnep, Yellow Turnep, &c. —Squash, &c. —Broad Beans, &c. —Acazia, American Holly, Louisiana Black Walnut, &c.

Lanboth's Nurseries—Near Philadelphia. From the patronage already extended to this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquisitions of useful and ornamental vegetable productions. The collection now offered by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—albus Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of European kinds, and the selected varieties which have originated on this continent. These most are here observed in making the selection, and the whole is now offered as containing more, but these most worthy cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a view of expatriation. The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning the winter-season parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquaintances are continually making. In the portion of ground allotted to Green-houses are grown almost every kind of European Vegetable for seed. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The operation of those kind-labour to mix in seed—in short, the whole process of cultivation, in gathering, &c. all being under their own personal supervision, and highly judiciously conducted, to procure the greatest and most consistent, and available in a foreign importation, or on careless or inexperienced growers at home. Orders received by Parker & Co. Man, No. 21 Congress St. Boston of whom price catalogues of the whole may be had gratis. Persons ordering may be assured of having every article well and safely packed, and forwarded. Feb. 15. D & C. LANBOTH

PRICES OF COUNTRY PRODUCE. Table with 4 columns: Item, Unit, Price, and another Price. Includes Apples, Ashes, Beans, Beef, Butter, Flax, Flour, Grain, Hogs' Lard, Lime, Plaster Paris, Pork, Navy mess, Seeds, Wool, etc.

PROVISION MARKET. Table with 2 columns: Item and Price. Includes Beef, Pork, Veal, Mutton, Poultry, Butter, Eggs, Meal, Potatoes, and Cider.

MISCELLANIES.

The following humorous versification of an old story, is from the Boston Statesman—

"She stood in tears, the maiden all forlorn,
Who milk'd a (foud weach) cow with crumpled horn."

Miss Polly Dolly Adeline
Amelia Agnes Low
Was none of nature's Journeyman;
Unclassified work, I trow,
Her forehead was as smooth as glass,
Her mouth was a straight line,
And her eyes stood out as visibly
As letters on a sign.

The "Veins of the Capitol"
Was taller than Miss Low,
But then Miss Low's diameter
Made up for it, you know;
And tho' she was the "mould of form,
And wore unival'd shoes,
Her waist was not invisible,
And her feet were "made to use."

It was said Miss Polly Dolly Low
Was waiting to disclaim
The last sweet monosyllable
Of her romantic name;
And every Sunday evening
She could't let her golden hair,
And at the window, pensively,
Sat "sighing to the air."

And Cupid, little rogue, was kind,
That is so often cruel,
And to Miss Polly Dolly's flame
He sent a stick of fuel—
A tall and handsome man was he
The reigning village beau,
That made his bow one evening
To Polly Dolly Low.

He took a chair and sidled up,
And said, "I guess as how
You think Miss Polly Adeline,
I've come to court you now,"—
"I know'd it," said the overcoine
Miss Polly, "long ago"—
And on his neck she flung herself—
Affectionate Miss Low!

And then got up, quite out of breath
Young Ebenezer Stout,
And spoke again—"I guess as how
You don't hear me out—
I thank you kindly for your less,
But I am not your love—
'T was brother Jocky wanted you
Miss Polly Dolly Low."

A curious mouse-trap.—A gentleman in Portsmouth, having purchased some oysters in the shell, on Wednesday evening, the 13th inst., deposited them in the pantry until the next day, when as his servant was taking them out to be opened, one of them exhibited the novel spectacle of two mice suspended from its mouth, having their heads fast gapped within the shell. It would seem that the oyster being somewhat distressed by the weight of the weight, had opened his jaws to make a little fresh air, when the wretched mouse, tempted by the alluring bait within the fisherman's parcel, thrust in their heads and were caught fast by the sudden collapsing of the shells, thus subjecting the generous victim to a new sort of *Odontaspis*. Our northern friends, who are always bragging of their mammoth vegetables and other curiosities, are challenged to show any thing equal to the exploit of this heroic oyster of the true Virginia breed. The oyster, with the two mice appended to it, just as they were caught, is left at this office for the inspection of the curious.—*Nor. Her.*

Singular interposition.—A lady had a tame bird which she was in the habit of letting out of its cage every day. One morning as it was picking crumbs of bread off the carpet, her cat, who always before showed great kindness for the bird,

seized it on a sudden, and jumped with it in her mouth upon the table. The lady was much alarmed for the fate of her favorite; but, on turning round, instantly discerned the cause. The door had been left open, and a strange cat was entering the room. After turning it out, the cat came down from her place of safety, and dropped the bird without doing it the smallest injury.

Cradles.—A writer in a southern paper condemns in strong terms, the practice of mothers, in rocking infants in cradles. He says the infant, instead of being suffered to lie quietly in a common bed, or little crib, and sleep when it wants to sleep—and play with its little arms and legs when awake, is from the day of its birth accustomed to the see-saw motion, which is as much at variance with the dictates of nature as of common sense. A habit of being rocked is thus created, which soon becomes difficult to be dispensed with. The little being is almost smothered in this confined machine, and it often becomes feeble and puny, though born plump and healthy. Its little brains are kept in a continued vertigo; and if they do not become completely addled, it is owing to the mercy of Providence, and not to the care of its nurse. Hence, it has been observed, that infants who have undergone habitual rocking, have not that sweet, smiling, and intelligent look, which distinguish those who have never been subject to it. They have a sort of wild glaring stare—there is no "speculation in their eyes"—and they are much later in developing their mental powers, if they ever enjoy the full exercise of them.

From the Albany Argus.

The extravagance to which modern *soires*, or evening parties have arrived, has become a matter of serious alarm to parents, creditors, and to the friends of moral habits. I have been accustomed to move in the higher circles of life, and am desirous that my children should enjoy the advantages of polite society; but if the present rage for extravagance continues, I must abandon this hope, or as wives have done before me, make a wreck of my husband's fortune.

I am the mother of three daughters, and two sons, who feel that they have arrived at years of discretion; but I am concerned to say, that they have become so infected with the prevailing mania that I at times absolutely doubt whether they are sound in their minds. My house has been turned upside down, and my husband's purse squandered to conform to fashion. The furniture which I received as a paternal dowry, has all either been sent to auction, or thrust into dark corners, as unfit for the present day. Partitions have been broken down, and all my domestic economy deranged to accommodate large parties, that my children might boast of indulging in greater extravagance of folly than our neighbors. And then the expense of new dresses—of confectionary—wines and *liqueurs*—of waiters and music—and a thousand other eteteras. It is enough to make a person absolutely distracted to think of it. I shall say nothing of the loss of health, which the impure air of crowded rooms, the damp and cold midnight exposure, and the indigestible compound of the entertainment, bring in their train, though our physician's bill would very soon satisfy you that we have *felt* much of it. But this is not the worst of the evil. I consider the sacrifice of household economy, property, and health, as the homage which folly pays to fashion. All this I

could submit to without mourning, to please my children. A discreet mother looks beyond present gratification. The greatest wish of her heart is to see her children well settled in life, and to enjoy the endearing consultations of a grandmother. Four of my children are of a marriageable age—and yet I see no prospect of realizing my wish. My sons are afraid of the expense of *keeping house*, and talk of matrimony only as an event which may happen when they are rich enough to live in fashionable style. The girls, poor things, would like very well to know how their luck is to be in the matrimonial lottery, though there be two blanks to a prize; but I fear, like the adventurers in the Jefferson lottery, their number will never be drawn from the wheel. The truth is, they have sincere admirers, and merit them; but marriage and extravagance have become synonymous in fashionable life; and young men dare not pluck the rose, lest they should be wounded by the thorn. So, as things are now going on, many an honest creditor must suffer—many a fond mother must despair of seeing her second and third generation rise up to bless her; and the philanthropist must continue to deplore the victims to celibacy, to disease, and to ruin, which ostentatious pride is daily immolating upon the altar of fashion.

One word of admonition, to those who honest industry, or fortuitous circumstances have thrown upon the surface. Your situation is doubly responsible—you are the arbiters of fashion within the sphere in which you move—few are able wholly to resist her witlecheries. Ponder, then, on the influence of your example upon society; and do not forget, that the highest mental pleasures flow from a consciousness of having been instrumental in advancing the rational happiness of those around us. I send you these, my complaints and admonitions, Mr. Editor, in the hope, and with the request, that as you are one of the guardians of the public weal, you will interpose your influence to check an evil which threatens to depopulate and bankrupt society; and by so doing, you will confer an everlasting benefit upon

A MOTHER.

AMMUNITION.—Sportsmen and Country Traders will find a constant supply of Powder—Shot—Falls—Percussion Caps, &c. of the best quality, and at the lowest prices, at the *Depot Powder Store*, No. 63 Broad-st. E. COPELAND, Jr. Feb. 15.

Account Books, &c.

Just manufactured a complete assortment of *Account Books* made of the best materials and in the most approved modern style adapted to every capacity of business. *School Books, Bibles, &c.*; *Papers* of all kinds; the greatest variety of *Stationery*, &c. to be found in the city may be had at unusual low prices, at No. 96 & 98 State-street, two doors east of Merchants' Row, by

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

BOTS IN HORSES.

MR FESSENDEN—Having lost a very serviceable horse, within a few days, by the bots, a few words of caution may prevent the like disappointment and loss to others. For a full and most interesting account of this deadly and hateful insect, I would refer to a communication of Dr Green, of Mansfield, in the 4th number of the 4th volume of the New England Farmer; the number for May 26, 1826.

From that article it appears that the insects do not arrive at sufficient maturity to be greatly troublesome to horses till nearly this season of the year; and commonly prove fatal, if at all, in this and the months of March and April. If, therefore, a horse is ill, from any unknown cause, in the latter part of the winter, or the spring months, bots may well be suspected, though none of the common symptoms, described by Dr Green, should appear. This was remarkably the case with my horse. He had laboured in the cart with his usual great power and willingness, constantly, till within two days, and given no indication, whatever, of disease, till within a few hours of his death. He was seen by several men of judgment and experience, who agreed that whatever the disorder might be, it was not caused by bots. And yet, on examination his lungs were found much inflamed, and from one half to two-thirds of the villous or inner coat of the stomach was entirely eaten away. It is therefore truly astonishing, that this patient animal had discovered no noticeable loss of flesh, strength or appetite.

From this case it is made certain that there can be no hope of relief but in some speedy application. And from the experiments of Dr Green, and similar ones, which I tried upon the insects, I am certain, that nothing which can be given with any safety, will destroy them. So that it is only adding much to the tortures of the poor animals, to administer any pungent, caustic, or astringent remedies, as is often done. The insects adhere so firmly to the horse's stomach, that they cannot be disengaged without considerable violence even after the death of the animal. They must therefore, be enticed to relinquish their hold, by something for which they have a greater fondness, and then be discharged by the immediate application of any powerful and active cathartic medicine, that may be at hand, before they regain their fast hold. From experiments made upon them in the stomach of the horse after death, I doubt not that from one to two quarts of milk and molasses given blood warm, would be as efficacious as any thing to disengage them. I have also discovered that they have a strong appetite for blood, and where it could be conveniently had, I presume the same quantity of blood, warm from any slaughtered animal would be as likely to effect the object.

But it is further to be remarked, that if we succeed in discharging the bots, still the horse may die from inflamed lungs, or spasms occasioned by the irritated condition of the stomach. And if we do not succeed in discharging them, the horse

may live if we can allay the inflammation and irritation.

It is therefore to be inferred from the communication above named, that the first application of all, should be opium to reduce the spasms, and "a free use of mild oils," to "lubricate the fibres of the stomach." To allay inflammation of the lungs, which may be known by coughing and difficult breathing of the horse, bleed freely "with a phlebotomy in the jugular veins."

A vigorous horse has a great quantity of blood. If the inflammation is violent, 3 or 4 quarts may safely be taken, and in a day or two, if necessary, an equal quantity may be again taken. If the animal lives, and the spasms and inflammation seem abated, you may then attack the insects more at your leisure.

As any horse is liable to be affected by bots, I have no doubt that a little tobacco cut fine, or blacksmith's cinders reduced to powder and sifted and mixed with a horse's provender occasionally, or a little dry ashes given in his water or grain, in the fall of the year, or early in the winter, when the insects are in their young and tender state, would serve to annoy, and probably destroy many of them.

After all, *prevention is the best remedy*. And this may certainly be made effectual, by carefully examining your horses every two or three weeks, from the beginning of July to the last of September, and with a sharp knife scraping off the eggs of the insects, which may be found deposited more or less, on most horses, especially those kept at grass or in open airy stables. They are found mostly about the fore legs and flanks, or under the throat of the horse. Respectfully,

South Boston, Feb. 27, 1828. L. CAPEN.

FOR THE NEW ENGLAND FARMER.

HORSES.

SIR—In my last communication, from "The peculiar" to "Country of Virginia," should be an integral paragraph; read "question of foot lameness" for "the management;" for "brought from the Desert," read "bought;" for the Suffolk Sorrel's "country," read "County;" at the commencement of that paragraph there should be no "but;" and for "gentlemen's" hunter read "gentleman's." I will now give you a few observations upon breeding a horse in Massachusetts, and will endeavor to express myself in the distinctest manner possible.

Where hay and pasture are so dear, a farmer can afford to breed from nothing but the right ware; or the horse will eat three times in four, more money than he will ever be worth, before he sheds a tooth. In England, a mare is covered, with a design that she shall produce a particular horse; and it is not common for any horse but the thorough-bred one to be used for any purpose but that for which he is bred. He, if not gifted with superior speed, is hunted; ridden on the road; or galloped till his strength is consumed, in a stage coach. Breeding from many of our mares is a certain loss. The right one is a thick little mare, fourteen hands three inches high, with as much speed as is compatible with an adaptation

for moderately heavy draught. Two things are indispensable. She must be perfectly sound in her feet; or unsound distinctly from accident, very improper treatment, or external disease, and she must have a wide chest. She may, comparatively, be spavined; ring boned; or even blind; but I am so convinced of a predisposition to the disease which is the common cause of foot lameness being frequently hereditary, that, if the cause of it were not evidently as above-mentioned, I would not take as a gift the finest colt bred from a mare suffering from foot-lameness. What sort of foot is the most likely to remain uninjured by the severe concussion to which it is here necessarily exposed, it is difficult to say; but a flat, vulgar looking one is decidedly my own preference. It generally possesses less sensibility and susceptibility of inflammation, and the horn is weaker and less able to contract than that of a foot of a more beautiful original formation. There are many reasons why she should have a wide chest. If she has not, she will neither have a good belly for the young horse to grow in, constitution to nourish him before his foaling nor milk enough for him after he is foaled; and she will be in danger of transmitting to him a figure, which he is more apt to take from his dam than his sire, and which it is very important in this climate he should not have. Many narrow-chested horses make it up in depth, and possess extraordinary powers in every way; but they are generally light in the flank, and high on the leg; hectic in their constitutions, and variable in their spirits; very superior walkers and trotters; but they will bear neither east winds nor daily labour. The mare's colour is of little consequence; excepting that it should be recollected that chestnuts, or as we call them, sorrels, particularly light ones, who have always a good deal of white, are far more liable than other horses to the sympathetic diseases of the lungs and skin. The number of broken-winded chestnuts in Massachusetts is four times that of any other colour. As I am acquainted with but three horses in Massachusetts fit to breed from, there is not much to be said about the sire. A very celebrated English horse is expected here in the spring; and I believe in Vermont there are two covering of unexceptionable performance. Cerk of the Rock is a good little bay horse; got by Eclipse's sire, Duroc; dam, own sister (called here full sister) to Eclipse's dam, by Messenøer; grandam, bred by Lord Grosvenor by Potto's out of a Gimcrack mare.—Trouble is also by Duroc; dam by Hickory out of Eclipse's dam. A horse, here is said to be got out of, for by, another horse; a most ridiculous corruption.

The next thing is to have the mare's gestation proceed under favorable circumstances, and to have her foal at the right time of the year. On this there is little to be said; a mare is perfectly fit for ordinary labor during most of her gestation, and is all the better for it; and the proper time for foaling, in this climate, is the first of June.—Even in England, where the forwardness of a thorough bred horse is a matter of extreme pecuniary importance; he being often matched, to run at two, before he is foaled, and all foaled in the

same year carry the same weights; their most distinguished breeders, who have examined and scrutinized the subject, are of opinion that a January colt will not be unen forwarder than a June one; that the first will lose more by the exposure soon after his foaling, than he will have gained by having had more time to grow.

The third, and by far the most important thing of all, is the horse's treatment from the time he is foaled till he is full grown. One of the most celebrated sportsmen of modern times has declared his opinion, that it is in the power of art to make a superior bone of any colt that nature has not deformed, and whoever is aware of the effects of different methods of rearing children will not be disinclined to agree with him. The grand enemies of young animals are moisture and bad food; and the younger, the more scrupulously should they be preserved from both. A horse should be fed better, and kept warm and dry more the first year of his life, than any other; and it is an advantage he will never lose. Many of our farmers have an idea that though insufficient nourishment will check the growth, the horse will still be a good one, though of small size; in England they assert that his height will be the same, but that he will be weak and lanky. I have the opinion of one of the oldest Merino sheep breeders, that it is indispensable that fine lambs should be kept warm and thriving, or they will not pay. A long coat is both the cause and effect of not thriving. If any one will examine long-coated and short-coated horses exposed to the same rain, he will find one saturated with water under the belly, chest and throat; and not dry for some hours after it is done; that the water runs in streaks from the back of the other, that his belly, chest and throat are dry; and that he dries all over as soon as the rain is done. The different effect upon the insensible perspiration and the lungs are evident enough; and, if a colt wears a long coat, he should not be exposed to continued wet weather.

The thorough bred horse is always allowed, in England, a full allowance of corn at all periods of his life, if well. All danger of his being injured by over feeding is prevented, by the attentive and experienced hands in which he is placed. He is carefully groomed at the earliest age; the advantage of this and clothing, no one is ever convinced of by any thing but experience, though he knows the benefit he himself derives from flannel and flesh brushes. Nothing of this, however, is necessary here, excepting that the horse should have a little corn, oats in preference to any other kind of corn, the first year. He must not, however, more than any other horse, be fed high on any kind of food, or he is in danger of some local inflammation. He may have that of the lungs and die; or get well with his wind touched or his feet spoiled for life. The thickness of wind arising from thickening of the wind-pipe, is attributed in England to improper treatment of the distemper. Man has various temperaments; the horse none but the same means. All his diseases, that do not arise from contagion, assume an inflammatory form. If he has been allowed to suffer from severe colds, when young, he will be preternaturally liable to them through life. This can be explained on anatomical principles; it is an analogous fact, that the native of a warm climate has his health less affected by the first northern winter he is exposed to, than by any other; and that in Napoleon's Russian Campaign, the Italians and

Spaniards suffered less than the Germans and the Poles.

The colt requires nothing but grass and hay after the first year. He should be perfectly broken in the winter before he is three years old; but must not be taken upon a frozen road. He is less in danger of being injured by being brought into work at that age, from the gentleness with which he will probably be used, than he often is from being presumed after five, to be fit for common labour without time's being given him to be accustomed gradually to it. A horse taken from grass or the cow yard should eat no kind of corn till he has been a long while in work. He will puff in the houghs and heat in the feet, after walking five miles on the road; and if the fever attending his first attempts at labour, particularly if he is very young, is increased by full feed at the same time, it will throw itself into his feet already heated by the unusual concussion, and do him permanent injury. He is especially in danger of this, if first used on the frozen roads of the beginning of the winter, when they are perfectly unelastick, and he is excited by the state of the atmosphere.

Spavins and ringbones are sometimes thrown out by a colt; and their nature is not understood by our farmers generally. At the lower part of the front of the hough there are a number of joints, occupying together but a small space, and possessing but little motion. Upon any considerable inflammation, they are liable to secrete bony matter, which fills up their interstices; and generally projects in front or on the inside of the hough, and is evident to the eye. It appears suddenly, and soon barlens. As the separate bones then form one solid mass, it is obviously incurable. It is very common in oxen; butchers being frequently obliged to cut through with an axe, what was once a number of bones joined together. When it is soft it is absorbed by a blister. It may arise from the inflammation occasioned by a violent blow upon some part of the leg; and I have a colt spavined in both legs from a severe kicking. It is not to keep a horse out of condition from his pain; but many of our first-rate work horses are spavined. When I speak of spavin, I, of course, mean bone spavin; bow and blood-spavins, as well as thorough pins being nothing but wind-galls of the hough. A ring-bone is of the same nature as a spavin; and generally proceeds from inflammation of the eastern joint. It has been ascribed, in some instances, to stamping off the flies; and I have had one arise apparently from that cause.—So simple a reason, however it would be difficult to make a farmer believe. It is not an invariable cause of lameness. Like a spavin it is incurable, excepting in particular states; no, exactly corresponding, however. Curbs are common in thorough bred colts; but are, comparatively of trifling consequence and always to be cured.

Any one, that does not acknowledge the assistance which nature may receive from art in a young animal, must have shut his eyes upon the vegetable world. Every domestic animal was intended to reap the advantages of civilization in his food and shelter as much as man; nor can he be in his highest perfection without them. For the very fullest development of a horse's powers, he must be kept continually in a high temperature. It is very well to laugh at the extent to which this appears to be carried; but the fact is not to be disputed.

THE VINE.

Extracts from the *Vue Dresser's Theoretical and Practical Manual*. By Theobald de Berneaud, Perpetual Secretary of the Linnean Society of Paris, &c. &c. Translated from the French.

The vine belongs to the natural order, *Sarmen-tose*, a family of plants with stem like branches. The class is pentandria monogynia; leaves alternate, palmated, five lobed, more or less distinctly incised or dentated; green or blueish, with flowers or clusters, opposite to the leaves, supported by a common peduncle, which turns to a tendril if the blossom fails. The flowers are small, greenish—the calyx very small, whole, and five toothed—the corolla is formed of five deciduous petals, sometimes is united together at their summits like a crown, and shed without being disunited. The stamens are five in number, opposite to the petals; their filaments subulate, and supporting simple anthers. No style stigma sessile [close set] in a five-chambered ovary. This ovary becomes a round or oval berry, juicy, multilocular when ripe—with five stony seeds—two, three, or four of which are abortive. The fruit is only borne on the shoots of the year, and generally at the fifth, sixth and seventh joint; so that if the seventh joint has made its appearance without sign of fruit, none need be expected from that shoot.

The species, or varieties of the vine, are very numerous. Their names must long remain obscure and empirical, in a measure; for the labor of arranging them in some regular nomenclature is greater than can be imagined; it can only be accomplished by the concurrence of agricultural societies. It has been attempted, for the vineyard of Arbois [Jura], by Dumont, corresponding member of the Linnean Society of Paris; and in Spain, for the vines of Andalusia, by a distinguished and learned naturalist, Don Simon Roxas Chamante—their works only convince us how long we must be condemned to wait for the completion of this interesting portion of the history of the vine. The same names are attached frequently to the distinct varieties; and often, the one variety is so altered or deteriorated by different modes of cultivation, soil, and exposures, that it cannot be known by the name. To obtain a clear summary of these varieties, some certain rules or designations should be chosen, and the value of the characteristics taken to calculate upon, should be fixed and established. The roots are partly penetrating, partly running, and thickly fringed with capillary threads. The stem is cylindrical, thin in proportion to its length, and requires support. When young, the stem is more or less strongly divided, and marked by joints or bends. A single plant of the vine is sometimes termed a *slip*, sometimes a *stock*; the latter name is more particularly given to that part of the vine which answers to the *trunk* in trees; in the wild state, there is no certain length or thickness, both seeming to depend on accident; but they are regulated by the vinedresser, according to his mode of cultivation. The *stock* when young, is covered with a green or tawny bark, which becomes brown with age; it is uneven in thickness, and irregular in adherence to the wood; most frequently seamed and split lengthwise, and loosened from the wood in long narrow layers or overlapping parcels, which are in the end entirely started and swept away by the wind and rain. In cold countries, the bark is more even. From the *stock* or trunk, spring the *shoots* or branches, stem-like—sometimes forked smooth

—of a reddish grey in the woody fibre, and green in the herbaceous portion—their number very various, and the length indeterminate, only, that those growing upward, are shorter than the lateral shoots which run horizontally; and these again are shorter than the lowermost, which trail on the ground. The thickness is generally proportionate to that of the stock or trunk. In the shoots of the season, or yearling branches, the pith fills the whole ring of the woody part; the next year the wood is thicker and the pith less; the third year, there is only a trace of pith, and in the fourth year, the wood is solid. The short twigs springing from the principal branches, are termed *secondaries*, or *second shoots*: if the sap be poor and scanty, there will be, on the shoots, many buds or beads, which, perhaps, do not unfold at all; but if the juices of the plants are plentiful and vigorous, the sap swells and drives all these buds into *second shoots* of considerable length, which bear fruit as well as the shoots proper. Young vines, and those that have been topped by any accident, are liable to bear a great many of these second-shoots. On the shoot we find the *leaves*, the *fruit*, in bunches opposite the leaves, and the *tendrils* by which it clings to other objects to support itself. Sometimes the shoot terminates in a small bunch, the berries of which are small, crowded, and generally round. The leaves are mostly largest nearest the stock, and diminish in size towards the extremity of the shoot. The more the leaves are sharply lobed, the less they preserve the orbicular figure. The ribs are very large and distinct, and sometimes have the same tawny or reddish tinge as the leaf-stalk. The tendrils, or *cirrhi*, are a filamentous growth, an elongation of vessels of the shoot. They are rarely stationed at random, but generally opposite to the leaf; are branched or forked, according to the strength of the species, the nature of the stock, or the vegetative powers of the shoot. They may be converted into fruit stalks by the following simple appearance: When branched or forked, the smallest or weakest prong must be nipped off closely and neatly; three or four days after, on the prong that is left, small buds will make their appearance, which increase and produce well formed bunches, and mature into excellent grapes. This experiment was made for the first time, in 1817, by M. Ristelhuber, of Strasburg; and has been repeated by a great number of gardeners and vinedressers, and always with perfect success. The *berry* is round or oval, varies in size and hue, being lighter or darker, of a blackish purple, foxy or green, white or golden yellow. The color is principally confined to the skin, which is thin, leathery, or coriaceous; the pulp and the juice are very colourless, even in black grapes. The delicate bloom which coats the berry when ripe, is a symptom of maturity worthy of notice, according to Gardiel and Estevan Bouffelon. Each berry is attached to a fruit stem or foot-stalk, which springs from the main peduncle or stem of the bunch; the assemblage of main or minor stems and berries, constitutes the bunch. The aroma of the vine when in flower is highly prized in the East, and thought to possess incredible virtues. It has a very volatile and penetrating fragrance.

Sheep in Great Britain—(Abridged from London's Encyclopedia.) The *long woolled* British sheep are the Teeswater, old and new Leicester, Devonshire Nots, Exmoor, and Heath breeds.

The *short woolled* are the Dorsetshire, Hereford or Ryeland, South Down, Norfolk, Cheviot, Shetland and Merinoes.

The old Leicester or Lincolnshire breed have no horns. The carcase is long and thin, and the wethers weigh from 20 to 30 pounds per quarter. The wool is from 10 to 18 inches long, and weighs from 8 to 14 pounds per fleece. The Teeswater are similar to the Lincolnshire, but the wool is shorter. Some of them have been fed so as to weigh 55 pounds per quarter. The Dishley or new Leicester breed have round, barrel shaped bodies, and no horns. They are peculiar for being fat. They yield from 6 to 8 pounds of wool, and weigh from 18 to 26 pounds per quarter. The Devonshire Nots have narrow backs and coarse wool.—The Exmoor sheep are small and flat sided. The Heath sheep are a race which ranges over the mountainous districts of Britain. They have large horns, black faces and legs, and coarse shaggy wool.

The Dorsetshire sheep are mostly horned, stand high upon small legs, and are long and thin in the carcase. The fleece weighs 3 or 4 lbs. Some have no wool upon their bellies. Many of the native sheep of New England resemble the Dorsetshire breed. The Herefordshire sheep are without horns and bear fine short wool, weighing about 2 pounds a fleece. The mutton is excellent, and weighs from 10 to 18 pounds per quarter. The South Downs have dark faces and legs and no horns. The fleece is fine and weighs from 2 1/2 to 3 pounds. The mutton is good, and weighs about 18 pounds per quarter. The Norfolk sheep have large horns and black faces and legs. The wool is fine about 2 pounds per fleece. The Cheviots have long bodies, and no horns. The Hebridean sheep is the smallest animal of its kind, weighing when fat only five pounds per quarter. The Shetland sheep have hair and wool mixed together.

The Spanish or Merino breed bear the finest wool of the sheep species. They are not very numerous in England. The fleece is from 3 to 5 pounds. M. Loudon says the harder the fleece is, and the more it resists the external pressure of the hand, the more close and fine will be the wool. Here and there a fine pile may be found in an open fleece but this seldom occurs.—*Hamp. Gaz.*

Birds of the Mississippi Valley—Mr. Flint, in the last number of his Western Review, has an article upon the birds of the West. He observes that he has noticed no birds in the Atlantic country, which he has not seen in the western states. Some kinds that are always chattering in New England, are seldom heard to sing in the Mississippi Valley. The robin red-breasts of the west never sing the sweet notes of their song in New England. Thousands of robins winter in Louisiana, and perch by night in the thick cane brakes, where they are killed by hundreds with a stick. The blue bird is seen every pleasant day in the winter on the Ohio and Mississippi. The mocking bird, which imitates the note of all other birds is heard at all seasons of the year. It delights to sit on the top of chimnies, darting high in the air above, and then descending, all the while singing in the gayest manner. Parroquets are seen as far north as 40 deg. N. Lat. They fly in large flocks and prey on the apples and other fruits of the farmer. Their colour is a brilliant green. They are said to perch by hanging by their hooked bill

to a branch. The hooting and screaming of many varieties of owls are heard all over the Mississippi Valley. They imitate the cry of human distress and laughter and sometimes the shrieks of a babe. Mr. Flint says he has heard forty at a time on the lower courses of the Mississippi. The swan is well known for its statelyness and brilliant white. Sank-bill cranes are seen in countless numbers; sometimes acres are covered with them; they seem at a distance like immense droves of sheep. Pelicans sometimes pass over the villages in flocks reaching a mile in length. Below their bill they have a pouch which will contain, it is said, two quarts. They are very noisy and prevent the boatmen from sleeping. The wild turkey breeds with the domestic one, and the former entices the latter into the woods. The New England quail is called a partridge in the west, and the partridge is called pleasant. Prairie hens are seen in great flocks in the prairies of Missouri and Illinois. They are larger than the domestic hen; they sometimes prey upon the farmer's corn-fields.—These birds are easily tamed.—*Ibid.*

WATER-ROTTED FLAX.

It will be our object to show that flax water rotted is superior to that which is dew-rotted.—1st. It is more durable. To ascertain this Mr. Goodsell placed on the ground a quantity of Flax that had been sufficiently water-rotted for dressing, by the side of an equal quantity of unrotted flax, and turned them once in three days, until the new flax was sufficiently rotted for dressing also; and, upon examination, he found that that which had been previously water-rotted had lost none of its strength; both parcels were suffered to remain on the ground, until the dew-rotted became worthless, while the water-rotted was found to be still strong and good. The same gentleman states that he repeated the experiment with dressed flax, and with the plant, and found the result the same. 2d. It will yield a greater quantity of fibre from a given quantity of the plant. The same gentleman states that dew rotted flax averaged from 12 to 16 pounds of fibre only, while the water rotted gave from 16 to 25 pounds.

In Ireland, Holland, and France, flax is invariably water-rotted; and it is stated by the manufacturers of canvass that 100 pounds of Dutch flax will yield 72 pounds of clean flax, Irish 65 pounds, while the like quantity of American dew-rotted will yield only 40 pounds. No reason can be discerned why the American flax should yield so much less than the Dutch, unless it be in the process of rotting, dressing, and preparing it for market. It is worth more: while the American dew rotted flax brings in market but 9 cents per pound, and in that proportion.

To water rot flax, let it be totally immersed in water, and the surface covered with boards, straw, or any thing else, to exclude the rays of the sun. In summer, when the weather and water were both warm, it has been known to rot in seven days; in colder weather a long time will be required. When taken from the water, it must be spread to dry.—*Hamp. Sentinel.*

Governor Lincoln has appointed Thursday, the third day of April next, to be observed as a day of fasting and prayer in Massachusetts.

Governor Lincoln has been elected a Trustee of Amherst College, to supply the vacancy occasioned by the death of Judge Howe.

[Extracts from Loudon's Gardener's Magazine for Jan. 1828.]
On the various uses of rhubarb stalks, by James Luckcock, of Edgbaston, near Birmingham.

Mr. Luckcock refers to the Monthly Magazine for Sept. 1817, Aug. 1818, and Nov. 1819, for what he has said on the culture of rhubarb. he complains that the plant is now treated of in the third edition of Nicol's Kalender:—but in Mr. Nicol's time, the plant was little attended to. He states that he has three sorts of which he knows the name of only one, called the Turkey rhubarb, *rheum palmatum*. The produce of this, according to his account, is much less than that of the other two sorts, which, from sketches he has sent us, are obviously some of the hybrid entire leaved varieties. Offering Mr. Luckcock our best thanks for his communication, we give the following extract from it, as the most likely to interest our readers:—Since the publication of the documents in the Monthly Magazine, the increase of produce and demand in this neighborhood has been twenty fold, perhaps fifty; and I feel a proud gratification, when I am sometimes told that this increase has probably been chiefly owing to my statements. This has induced me to continue my observations, and to endeavor to point the public attention to its various merits. I need not appeal to the experience of others for its delicious flavor, but I can, from long attention, pronounce it to be equal to the choicest of our fruits in its effects on the human frame during the sultry months of the summer, being cooling, and slightly cathartic. I cannot recommend a more palatable or wholesome article, and more especially if taken cold in hot weather, than the pies we use in our family.— With a little yeast, put into the crust, we have it light and porous, about an inch or an inch and a half thick. This I believe to be the only kind of pastry that is good for the stomach, and decidedly so for that of an invalid; and there are few constitutions so feeble or delicate, but what may freely partake of it without any fear of bilious consequences, or of any flatulence or indigestion. It continues its produce in the gardens from the beginning of May to the end of August, and has another great advantage, that it will make an excellent preserve for the winter. It should not, however, be suffered to grow too old before it is cut; like every other vegetable, there is a point in its age when it is at its highest perfection. We cut it into squares, put it on a pan in single layers, and then place it in an oven so moderate in its heat, as to require about twelve hours for the process; it should have a very small portion of its moisture left; and then we put it into wide-mouthed bottles, with about a fifth or a sixth part of its weight of brown sugar. If, in the course of a day or two, the dissolving of the sugar produces a small supply of liquid, the quantity of moisture is right, and by frequently shaking the bottle for a week or two, the article will be good for use, till the gardens give their next supply. The bottles should be covered with bladder.

I had supposed, from the great quantity of liquid contained in rhubarb stalks, that it might supply a new cider, but fail, on trial, that it contains so little of any saccharine matter, that it will not ferment. I, however, made some wine from the puce without any water, and have a few bottles left of ten years' vintage, and it is really very good; but like all the home-made wines, it is neither more nor less than sugar wine, seasoned with the flavor which gives the name

An orchard in miniature; or, the culture of apple trees as dwarf standards, after the manner of gooseberry bushes.

Sir,—Observing in your Magazine for September Mr. Harrison's method of growing apples against a wall, allow me to obtrude my simple mode of growing them in open quarters, upon dwarf trees, which I have followed about seven years, the last three of which have successively strengthened my conviction of its utility.

By planting the proper sorts, apples may be grown in as small a space of ground as gooseberries; and a small or large square, according to the size of families, appropriated to apples, will grow every year enough to supply their wants. I am not vain enough to think that I am alone in growing them in this way, as I should think horticultural economy would prompt many besides myself to gratify their eyes, their pockets, and their appetites, in so easy a way

Like most practicalists, I should, perhaps, find it much easier to tell and show than to write what I mean; but "I will do my best," as the author of *Ivanhoe* makes Hubert say; for my grandfather, though he did not draw a bow, drew a knife.

I have my ground, a strong clay, trenched two feet deep in December; as soon as it is settled, say a fortnight after trenching, taking advantage of a frosty morning, the holes are opened and left for the frost to mellow. February is the best month for planting on heavy ground; by that time the earth taken from the holes will be in a fine pulverized state. The holes need not be very large—two feet over, and one and a half feet deep, will be enough. With some rich loose soils there will be no occasion for trenching; but then the holes must be larger, say three feet over and two feet deep. The plants must be six feet apart every way. I arrange mine in quincunx. See plate.

With a six foot measuring stick this is done with scarcely any trouble. I do not know any sight more pleasing to a domestic mind (for what fruit contributes more to our comfort than the apple?) than this orchard in miniature, when covered with bloom, and again when laden with fruit, as they seldom miss bearing in abundance.

This plan will not extend to the strong growing sorts, as they are not easily kept within bounds; but the following six will amply repay the trouble and trifling expense of planting. I have placed them in the order of their ripening—manks' codlin, hawthornden, kerry pippin, down-ton pippin, christie's pippin, and the old golden pippin; to which may be added coe's golden drop, a most excellent late table apple. The trees must be chosen with stems not exceeding one foot six inches. In September I generally look over the trees, take off superfluous wood, and shorten the long shoots; this strengthens the bloom buds which are formed abundantly upon the young wood of all the sorts named; of course, in doing this, an eye must be had to the formation of the trees, which ought to be gradually brought into a handsome round bush. For the first years, a row of strawberries may be grown between each row of apples, or any other dwarf light crop; but strawberries are most in keeping, a word which, in every gardening operation, ought never to be

lost sight of. Let me add, they ought to be worked on Paradise stocks, or the small wild crab, (mine are on the last) not by any means on the free stock raised from apple pips, the very worst stock that can be used.

Now this accoethes scribendi is upon me (it is a wet day), allow me a little more space, merely to give you one of the best receipts for keeping hares and rabbits from apple trees. I write from experience; for, till I used it, I had annually a great many trees destroyed in spite of every precaution. Take the commonest train oil and hog's lard (if stale it can be bought cheaper), mix them well, till they are of the consistence of thick paste, which the mixture will much resemble, and apply it rather sparingly with a painter's brush.— This will effectually keep off those destructive vermin, and not injure the trees, as the lard neutralizes the pernicious effects of the oil.

On the cultivation and management of Timber Trees.

Sir,—Allow me to impress on the minds of land proprietors, and managers of woods and plantations, the necessity of studying the cultivation of timber as a science. We see very little attention paid to the arrangement of the different sorts of forest trees in planting, whether it regards the different soils to be planted, the situation, or the effect to be produced in regard to landscape scenery; and if knowledge be wanting in the above cases, we see a still greater want of it displayed in the management of plantations, in regard to thinning, pruning, &c. It would be almost impossible to lay down a universal rule for the management of plantations, but there are certainly fundamental principles to be acted upon in the cultivation of forest trees.

The thinning of plantations is a matter of great importance, in regard to shelter and appearance. To make all the trees stand as much as possible in the angles of equilateral triangles, or, in other words, in quincunx, is one rule that should never be lost sight of, for it is evident more shelter will be afforded from trees standing in triangular positions than in squares or rows; besides, the above method disposes the trees regularly over the ground, in respect to their nourishment. How often does the woodman, for the sake of leaving a good tree, as he calls it, leave two trees within a few feet of each other, at least so near, that the one is crushing the other, and cuts away a third, that should have remained as a permanent tree.— The reason he assigns for so doing is, he wishes to leave the best trees, that is, the largest, not considering that the small tree, if it had a good leading shoot, and was otherwise a well formed tree, is as likely to make as good a tree at a future period as the one he has left, or perhaps better. I have seen many plantations disfigured by the above method of thinning, besides the loss to the proprietor. In the course of practice in thinning plantations, especially when under thirty years of age, I have never hesitated to cut down a larger tree than the one next to it, if by so doing I got my trees to stand in a more regular form, and the smaller tree was equally healthful. By following such a method of thinning, there is more to be made of thinnings, besides managing the plantation in a way for its future welfare.

Pruning of woods and plantations is another important part of their culture; but that subject would make my letter too long. I will therefore defer it at this time hoping the cultivation of timber will become more a professional pursuit.

RAISING HORSES.

There is, perhaps, no country where less attention is paid to the raising of good horses, than in New England. This is somewhat surprising, when it is considered that fine horses meet with a ready sale, and command a large price; and also, when it is considered that the country is peculiarly adapted for the raising of stock, rather than grain. The farmers well know that it costs no more to raise a handsome, spirited colt, than it does a homely, stupid beast. Still they go on in the old beaten track, raising inferior horses, which have neither beauty nor animation; and the young Miss is carried in a gig by a lineal descendant of the same dobbie that used to carry her grandmother on a pillow, jogging along at the rate of three miles an hour. This is chiefly owing to the want of care in selecting the breed of horses, though something is due to the manner of training them. The farmer who would make the raising of horses profitable, should provide himself with first rate blood mares; he should likewise see that the sire is of good lineage, and that he does not disgrace his ancestry. By paying attention to this first requisite, as well as by judicious feeding and training, the farmer might obtain from one to two hundred dollars a piece for his colts, at four years old, as readily as he now does fifty. We lately read an account in the American Farmer, of the mode pursued by Wm. E. Rodnoxe of Virginia, in raising blood horses. He weans his colts, the 1st of October, in a stable rather than a lot, because if left out, they are apt to run themselves poor, before they are weaned. He feeds them well the first winter, and forces their growth as much as possible; after which, being stout and vigorous, inferior keeping will answer the purpose. In order to elevate the neck and withers of a colt, he stables them with his rack and manger so high, as to strain him a little, to get food, as also with the windows very high, because he will be looking out at them; thus his shoulders will be thrown back and his neck and head elevated. There are three kinds of horses which it would be for the interest of the farmer to raise, namely, the elegant horse, &c.—spirited horse, fit for the saddle or the carriage—and, the stout strong horse, adapted to the draft of heavy loads. Horses of either of these characters, are constantly in good demand, and bring a generous price. The fine grazing soil of our mountain sides, and vallies, is well calculated for the raising of horses; and while neat cattle are cheap, and the price of wool is depressed, the farmer would be certain of making money by the production of good horses.—*Berkshire Amr.*

We have on our table, [says the Harrisburg Argus] a slip of paper, manufactured from straw, at the mill of Colonel Magaw, near Meadville. The specimen before us, though without sizing, may be written upon without the ink spreading in the least; it is somewhat rough, but being the first that was made, great improvement may be expected to be made upon it.

A patent has been taken out in England, for making roofs of thin sheet iron. It is said to be of less weight than slating, and to be less liable to damage by wind. [We believe the plan has been tried in this city, if we are right, upon Mr. Richards' house, in Third-street—which was so much injured by fire last winter.]—*U. S. Gaz.*

A desperate drunkard.—It is stated in the Portsmouth Times, (Ohio,) that a man came to that town, whose thirst for liquor was so insatiable, that he suffered a dentist to pull a sound tooth, and sold it to him for sixty cents—with which he bought rum, and got drunk. Such a slave to his appetite would cut his throat for a gallon of whiskey, provided he could get it on twelve months' credit.

It is stated that the oyster-beds in Delaware Bay, Cumberland county, (New Jersey) yield annually 150,000 bushels of oysters.

Value of time.—In selecting this theme, it is not our intention to write a moral essay. We use it, merely to call the attention of the reader to a motto, which was adopted by an industrious man, who had been frequently robbed of some of his most valuable moments, by the interruption of fashionable visitors, who often broke in upon him, for the purpose of informing him, how extremely cold the weather was without. He had a label hung on his door, with this inscription:

"Time is my estate—if I lose an hour, I shall incur a debt which I can never pay."

This hint had its effect; may it be profitable to all who read it.

A great excitement has been produced in Mexico against masonic societies; and Mr. Poinsett, (the American minister), has rendered himself odious to many of the bigoted Mexicans, by favoring masons and masonry. They threaten to expel him from the country.

The man who boasted that he could wade the Mississippi, whip his weight in wild-cats, &c. is said to be a member of Congress, from Tennessee. He says he can whip any man in the House of Representatives. What an excellent Legislator.

From Cobbett's American Gardener.

FLOWERS AND ORNAMENTAL GARDENING IN GENERAL.

JONQUIL.—An elegant and sweet smelling bulbous rooted plant; propagated, and cultivated in all respects, like the hyacinth.

KALMIA.—An evergreen shrub of great beauty, and of several varieties; great quantities of which are seen in most of the rocky woodlands of this country.

KILL-CALF.—This is a dwarf shrub, and may be raised from seed, or from suckers; it is very pretty. When in bloom, it resembles a large clump of sweet williams. It is so pretty, that it is worth having in the green-house, where it will blow in April.

LABURNUM.—A tall and beautiful shrub, loaded when in bloom, with yellow blossoms, in chains; whence it is sometimes called the golden chain.—It will grow and thrive in this country. It is raised from the seed as easily as Indian corn.

LARKSPUR.—An annual, of no smell, but of great variety as to colors; and, when in a clump, or bed, presents a great mass of bloom. There is a dwarf and a tall kind; the dwarf is the best.—There is another sort which branches, that is good for nothing.

LILAC.—Desirable for its great masses of fine large bunches of bloom. There is a white, a blue, and a red. Is propagated from suckers, of which it sends out too many, and from which it should be kept as clear as possible. It is an ugly shrub when out of blossom. The leaves soon become

brown; therefore, there should be but few in a shrubbery.

LILY OF THE VALLEY.—It is a pretty little dwarf plant, that thrives best in the shade, where it produces beautiful blossoms of exquisite sweetness. Is a bulbous root, and propagated from offsets.

LUPIN.—A species of pea or tare, and frequently cultivated in the fields, and eaten in soup and otherwise, by the Italians, and in the South of France. It grows, however upon a stiff stem, and is upright, and branches out, like a tree in miniature. There is a great variety of sorts, as to colour of flower as well as to size of plant. The yellow dwarf is the best, and it smells very sweet.—This plant is, of course, an annual.

MAGNOLIA.—One of the finest of the laurel tribe. It can be raised from seed, or from layers. A very fine shrub indeed. There are several varieties of it.

MIGNONETTE.—An annual that bears abundance of seed. The plant and the flower do not surpass those of the most contemptible weed; but the flower has a very sweet smell. It may, if you have a green-house, be had at any time of the year. The plants may stand at four or five inches asunder; but, if they stand thicker, the bloom is inferior, and does not last so long.

MYRTLE.—The Myrtle is a native of climates where it is never cold. It will not endure even November all out, in Long Island.—To have it, therefore, it must be housed in winter. It may be raised from seed, cuttings, slips, or layers.—The leaf of the Myrtle has a fine smell; and, when the tree is in bloom it is pretty. But, it is a gloomy looking shrub. One Goranium is worth a thousand Myrtles. The broad-leaved myrtle is the best in every respect, and especially because it is easily brought to blow.

NARCISSUS.—A bulbous-rooted plant, managed precisely like the hyacinth, which see. It blows early, is very beautiful, and has a delightful smell. Nothing is easier, than the propagation and management of flowers of this tribe, and few are more pleasing. The narcissus is a very fine thing for a parlor, or a green-house.

PASSION FLOWER.—So called because the flower has a cross in the middle, and rays, resembling a glory, round the edges of it. It is a singularly beautiful flower. The plant is also beautiful. It is a climber, like the honey-suckle; and, like that, has a succession of blossoms that keep it in bloom a long while. It is raised from cuttings, which, treated as other cuttings are, easily take root.

PEONY.—A perennial, that may be raised from seed or offsets. A grand flower for shrubberies; each flower is usually as big as a tea-cup, and one plant will sometimes produce twenty or thirty.

PEA (Sweet).—There are a great variety in the annual sorts, as to color of blossom; and there is a perennial sort, called everlasting pea. This stands, year after year. The others are sown and cultivated like the common garden pea. They should have some sticks to keep them up. This is a very showy flower, and remains in blossom a long while.

PINK.—This flower is too well known to need describing. There are a great variety of sorts, as to the flower; but all are cultivated in the same way. The pink root will last a great many years, but the flower is seldom so fine as the first year of the plant's blooming.

(To be continued.)

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 7, 1828.

GRAFTING FRUIT TREES.

Grafting is the taking of a shoot from one tree and inserting it into another, in such a manner that both may unite closely and become one tree. Its uses are, 1st. To preserve and multiply varieties of fruit trees, endowed with particular qualities, which cannot be with certainty transferred to their off-spring by seed. 2d. To accelerate the fructification of trees, barren as well as fruit-bearing: for example, suppose two acorns of a new species of oak, received from a distant country; sow both, and after they have grown one or two years, cut one of them over, and graft the part cut off on a common oak of 5 or 6 years' growth; the consequence will be, that the whole nourishment of this young tree of 5 or 6 years' growth being directed towards nourishing the scion of one or two years, it will grow faster, and consequently arrive at perfection much sooner than its fellow, on its own root, left in the ground. A French author found the advantage of this practice in a case of a new species of ash, to be as five to one in point of height. (*Cours Complet d'Agriculture, &c.* art. *Greffes*.) The third use of grafting, is to improve the quality of fruits; the fourth, to perpetuate varieties of ornamental trees or shrubs; and the fifth, to change the sorts of fruit on any one tree and renew its fruitfulness.*

Scions. Grafts or scions, should be shoots of the former year; of healthy fruit trees, and from lateral fruit-bearing branches, taking but one scion from the same twig. They should be cut off from the trees before their buds begin to swell—or about three weeks before the season for grafting. As soon as cut, they should be buried in the ground in a cellar, or out of the way of frost, half their length, and their tops covered with dry litter; or if they are to be transported any distance, their cut ends should be covered with grafting clay, or wax, or stuck into a potato, and the whole scion may be enveloped in swamp moss. If a small part of the former year's wood be cut off with the scion, it will keep the better. Mr. Preston says, "be sure in selecting the grafts to cut them in such a manner, as to always take the bulge between the years' growth to shave and set in the stock, as in that joint or bulge, the wood is curled, open, and porous to receive the sap readily from the stock."

Stocks. The best stocks are such as have been allowed much room in the nursery; those planted very close, have the wood soft; and the grafts on them, though they shoot strong, are not fruitful.

"The nature of the fruit is to a certain extent affected by the nature of the stock." Miller says, "that crab stocks cause apples to be firmer, to keep longer, and to have sharper flavor;" and he is equally confident, that if the breaking pears be grafted on quince stocks, the fruit is rendered gritty or stony, while the melting pears are much improved by such stocks." This, according to Neill, is scarcely to be considered as inconsistent with Lord Bacon's doctrine, "that the scion overruleth the graft quite, the stock being passive only;" which as a general proposition, remains true; it being evident that the scion, bud, or in-arched shoot, is endowed with the power of drawing or forming from the stock that peculiar kind

of nourishment which is adapted to its nature, and that the specific characters of the engrafted plant remain unchanged, although its qualities may be partially affected."*

The proper season for grafting, is thus indicated by M'Mahon. "Grafting is always most successful, when done at the period that the buds of your stocks are swelled, so as to be nearly ready to burst into leaf: this is the time in which the greatest success may be expected, and should be very particularly attended to; however, if done a few days before, or even when the stocks display several expanded leaves, there may be a tolerable good hit, provided the operation is judiciously performed."

Kinds of grafting. These are very numerous. London observes, that, "Professor Thouin has refined so much on the subject as to have produced or enumerated above forty modes of grafting, besides a great many kinds of budding and in-arching;" and another writer, M. Louis Noisette, has published the description of 137 modes of grafting. Those kinds which are most common in this country are described in Thacher's Orchardist, M'Mahon's Gardener, &c.; likewise in the New England Farmer, Vol. II pages 242, 250, 258, 265, and 313; Vol. IV, 281, and 290. Perhaps *left grafting* is as much used as any; and the following as important rules as any relating to it. "Be careful not to loosen the bark of the stock in splitting it; and the safest way to guard against that, is to slit the bark with a sharp pointed knife, before splitting the stock. The clay should be very fine and tough, and pressed and bound tight round the stock below the split, to retain all the sap that oozes out to support the graft."

SPRING WORK.

Mr. Preston, of Stockport, Pa. recommends setting posts with the top part placed in the ground; and intimates that they will, in that position, last three or four times as long as when the butts are placed down. The same judicious and experienced agriculturist advises, in making fences always to place the rails with the head side up. The posts should be set at least two feet in the ground. If those parts of the posts which are to be placed in the ground are burnt in a hot fire till quite black they would last much longer than they would otherwise. Some farmers cut their posts so long and mortise them in such a manner, that when the lower ends have become rotten they can turn them upside down, and it is said that they will last nearly as long again when managed in that manner.

Get your agricultural implements, such as ploughs, harrows, carts, hoes, &c. in readiness for use. These you have doubtless kept under cover during the winter, and they will last longer if they are painted or covered with some suitable composition. "Dr. Lewis," says the Domestic Encyclopedia, "advises all wood that is exposed to the inclemency of the weather, to be coated with a preparation of pulverized pit coal and melted tar, reduced to the consistence of paint, which he has found by experience to be very efficacious." Covering wood repeatedly with train oil, or other greasy substance will have a tendency to preserve it. Or if more convenient, use some cheap sort of paint, such as Spanish brown, or red ochre.—Where machines are necessarily exposed in the field, a great part of the season, they require to

be new painted at least every second year. This applies as well to the iron as wood, which should be kept coated with paint or oil as far as practicable.

Particular attention should be paid to your cattle, especially to cows which have lately calved, or are about to calve. If cows are lean when calving, no management afterwards will bring them to yield, for that season, any thing like the quantity of milk they would have yielded had they been kept in good condition during the winter and early in the spring. The Germans in Philadelphia, who supply the market with milk regularly feed their cows at mid-night with short feed during the winter. The disease called the hollow horn, or horn distemper, is owing to scanty feed. Roots, such as sugar beet, mangel wurtzel, and carrots, should be given them during winter and early in the spring, with their dry food, and they will serve both for food and medicine. The quantity of roots allowed to each cow or ox, should be varied according to circumstances, and the quantity and quality of the dry food consumed by them, and the apparent keenness of the appetite of the animals. Cattle, especially if fed with roots, should have a proper quantity of salt. Some advise to place salt under cover, and to let cattle, and sheep always have access to it and eat as much as their appetites crave. Dr. Cooper, editor of the Philadelphia edition of the Domestic Encyclopedia says, "a quarter of an ounce of salt per day to sheep, and one ounce per day to cows and oxen, is an allowance ample enough."

Rabbits in England.—The proprietors of some of the sandy soils of England stock them with rabbits; and these rabbit pastures are called warrens. The extent of warrens varies from 100 to 3000 acres. They are enclosed in walls of stone or turf. The varieties employed as stock are the common grey, and silver grey breeds. In severe weather in winter they are fed with hay, turnips, oats, &c. There are twenty warrens in the East Riding of Yorkshire, which contain together 10,000 acres. One warren at Brandon in Suffolk returns 40,000 rabbits in a year; 20 rabbits per acre is the usual produce; the carcase defrays the rent and taxes, and the skin is profit. One gentleman in Berks-shire raises rabbits of a pure white, the skins of which sell high. Many of the silver grey skins are dressed as furs, and exported to China to be worn by the Mandarins. (Abridged from London.)—*Hamp. Gaz.*

Improvement in the management of Bees.—The improvement is that of having double skeps or hives, the one on the top of the other. When the lower skep is filled with honey, it is to be removed after the bees are admitted (through the passage which is made to open)—into the upper skep; into this skep food must be put, and the bees will remain there, and go on with their work in it. When it is filled with honey, the former skep, with food in it, may be replaced, and the bees again admitted into it. The full skep is then to be taken away. This change of the skeps must always be made about mid-summer; and by thus annually removing the full one, more honey will be collected than is usual, and the bees will not be destroyed.—*Eng. publication.*

Time necessary for raising Peas.—It is observed, that the common pea, whether white or gray, cannot be reared to perfection in any field which

*Encyc. of Gardening. N. E. Farmer, Vol. I, page 121

*Ed. Encyc. art. Hort.

has not been either naturally or artificially impregnated with some calcareous matter. And hence it is supposed to happen, that peas are rarely cultivated universally as a field crop, unless in those parts of the country where either lime, marl or chalk abounds, or upon strong clays; except, indeed, on the sea coast, where shell-fish are of ten caught in abundance, and where the fields are manured with their shells in a state of mixture with dung. But it is remarkable, that a soil that could scarcely have brought one pea to perfection, although richly manured with dung, from their running too much to haulm, and after blossoming, dying away without becoming ripe; if it has once had lime applied upon it, is capable, who properly prepared in other respects, of producing plentiful crops of peas ever afterward. It is further remarked, on the result of an experiment, in which the ridge of a field had been missed in liming, produced no good wheat, while all the other parts afforded a good crop; that lime, or some other calcareous materia, is equally necessary for the production of good wheat crops as for those of the pea kind. The general observation that the wheat, where this sort of manure has been employed, is thinner in the skin, more plump, and yields better, seems also to favor the same conclusion. Impregnations of this sort appear likewise, particularly favorable for the production of barley crops, much more so, if in large productions, than for those of oats.—*Di. King's Farmer's Companion.*

BARLEY.

For sale at the Seed Establishment connected with the New England Farmer office, No. 52 North Market Street, Boston, a few bushels of plump *Seed Barley*, raised in Lexington, Ms.

COMPLETE GRAZIER.

For sale at the Seed Establishment, connected with the New England Farmer, one copy of the Complete Grazer, or Farmer's and Cattle Breeder and Dealer's Assistant. Comprising Instructions for the Buying, Breeding, Rearing, and Fatting of Cattle. Directions for the Choice of the best breeds of Late Stock. The Treatment of the diseases, and the management of Cows and Ewes during the critical times of Calving and Yearning. The general Economy of a Grass Farm. Irrigation or watering of meadows. Culture of the best natural and artificial grasses and plants for fodder. Various methods of cutting, mowing, and preparing food in several winters and seasons of scarcity. The economy and general management of the dairy, including the curing, and preservation of butter and cheese, &c. Together with an introductory view of the different breeds of Cattle, Sheep, Horses, and Swine. Also an Appendix on the Shepherd's Dog, Horses, Asses, Mules, Rabbits, Bees, Farm Accounts, and on the Improvement of British Wool. By a Lincolnshire Grazer. 3d Edition.

NEW ZEALAND SPINACH AND SUGAR BEET, &c.

Just received for sale, at the Seed Establishment, New England Farmer office, a small quantity of the New Zealand Spinach, the first ever introduced into New England; a particular account of this vegetable will be found in the New England Farmer, page 116 of the current volume, by a member of the New York Horticultural Society. Likewise, English Patience Duck, for early greens.

Also, 300 lbs. genuine Sugar Beet, raised, with much care by John Prince, Esq. Roxbury.

TO PRINTERS. The Establishment of the "Old Hampshire Post" is offered for sale. The office consists of an Imperial Wells' four press, large boxes of paper, two large primer's 48 Revolver, with a suitable proportion of Job and 700 subscribers. The Paper has at present about 600 subscribers, and a fair proportion of advertising patronage, job work, &c. Northampton is one of the most populous towns in the valley of the Connecticut, with prospects, arising from the plans of internal improvement now in progress or contemplation in the vicinity, of a fortunate increase of population. This long Primer is another paper published in the town, which has a subscription list of nearly 2000. A printer or editor, with a small capital, would find this an advantageous location for a well conducted paper, devoted to politics and general intelligence. The establishment will be sold on liberal terms, and transfer made by the 1st of May. The editors of the Boston Courier, Christian Register, New England Farmer, Worcester Spy, and Connecticut Mirror are requested to publish the above.

Northampton, March 1, 1833.

FARM WANTED.

Any person having a large and good farm, that is capable, and does make, not less than one hundred tons of good hay, with a suitable proportion of tillage and pasture land, and a good supply of wood and orcharding, with good buildings, and a pleasant and healthy situation, as to good neighborhood, (and not exceeding 60 or 80 miles from Boston, would be preferred,) will please direct a letter, along a very particular description thereof, (postage paid), and the best price and terms of payment, to A. Z. Care of Mr. Russell, publisher of the New England Farmer.

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England, of the crops of 1837. The greatest care has been taken to have them raised by our most experienced seed-growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

- Albicula*, Green Globe
- Asparagus*, Dutch
- Buttersea*
- Large white Reading
- Beans*, (20 varieties) including the English broad beans, dwarfs and pole.
- Beets*, the Long Dutch
- Early Blood Turnip
- Early White Security
- French Sugar, or Amber
- Orange
- Broccoli*
- Broccoli*, Early White
- Early Purple
- Large Cape
- Brussels Sp. outs.*
- Cabbage*, Early Salisbury dwarf
- Early York
- Early Dutch
- Early Sugarloaf
- Early Lion, Buttersea
- Early Emperor
- Early Wellington
- Large Bergen, &c.
- Large Cape Savoy
- Large Scotch
- Large Green glazed
- Large Blue Drumhead
- Tree, or 1000 headed
- Green Globe Savoy
- Red Dutch
- Yellow Savoy
- Turnip rooted, &c.
- Chou de Milan
- Russian
- Late Imperial
- Late Sugarloaf
- Cardoon*
- Carrots*, Arlington
- Early Horn
- Red Root for West India market
- Lenon
- Purple, (fine sort)
- Cauliflower*, Early and Late
- Celery*, White solid
- Italian
- Coleriac, or turnip rooted
- Chervil*
- Chives*
- Corn Salad*, or Vetchcock
- Cress*, Curled or Peppercress
- Broad leaved, or Garden
- Water
- Long Orange
- Cucumber*, Early Frame
- Green Cluster
- Short Prickly
- Cucumber*, Long Prickly
- Endive*, Green
- White
- Endive*, Green
- White Curled
- Green leaved Batavian
- Garden Beans*
- Garlic Sticks*
- Indian Corn*, (several varieties)
- Kale*, Sea
- Purple curled
- Green early Scotch
- Leek*, London
- Large Scotch
- Lettuce*, 14 varieties
- Marrow*
- Melon*, 11 varieties
- Mustard*, White and Brown
- Nasturtium*
- Onion*, 3 varieties, including the imported Madeira, Potatoe and Tree Onion
- Parsley*, Siberian
- Dwarf Curled
- Curled, or Double
- Peas*, Large Dutch swelling
- Early Washington
- Early double blossomed
- Early F. Golden
- Early Golden Hotspur
- Early Charlton
- Early Strawberry Dwarf
- Dwarf Blue Imperial
- Dwarf Blue Prussian
- Dwarf Spanish, or Fan
- Dwarf Marrow
- Dwarf Zigzag
- Blackless, or Tall Mar.
- Kuglit, Tall Marions
- Tall Crooked Tail Sugar
- Pepp. s.*, 3 varieties
- Pumpkins*, finest Family
- Centimeter Field*
- Mammoth*
- Radish*, 4 varieties
- Schuba*, h. bar roots, &c.
- Schuba*, or vegetable oyster
- Salsif*
- Sisyrinchia*
- Spinach*, 5 varieties
- Squash*, 7 varieties
- Tomatoes*
- Turneps*, 13 varieties
- Thymus*
- Lavender*, &c.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished, at this Establishment, with boxes containing a complete assortment of the seeds used in a kitchen garden, in its valuable terms as they can be purchased in this country, with delivery in small papers, at 6 and 12 cts each—as warranted to be of the growth of 1837, and of the purest quality. **ORNAMENTAL FLOWER SEEDS** will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts. The smallest order punctually attended to. Likewise, ESTABLISH ROOTS and PLANTS, FIELD and GARDEN SEEDS, POTATOES, and SWIFT HARDY SEEDS, MICHIGAN HEED SEEDS, BIRD SEEDS, and more than 200 different kinds of the SWEET & FLOWER SEEDS.

Also, The Early Jefferson Corn; a very early White sort, for the tables—with the common kinds of early and late Sweet Corn.

200 lbs. Sugar Beet & Mangrel Wurtzel raised by J. Prince, Esq. Roxbury.

200 lbs. Onions, Red, White and Yellow.

275 lbs. the Blood Beet, raised in Roxbury.

250 lbs. Radish, superior quality, &c.

Landscape's Nurseries—Near Fairhaven
From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated is 15,000, com- prising Trees and Shrubs—Greenhouses Plants—Mosses, Ferns, and Garden Seeds. The assortment of Ferns is vast and surpasses in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing more, but those most worthy of cultivation. Persons not acquainted with the different varieties by name, are desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently rely on the rest to the proprietors, without a board of superintendance.

The Ornamental department is rich in native and exotic Plants—It contains a splendid collection of Green house Plants, most of which are cultivated by growing in its various seasons, parlors, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and aquatic trees, are sent entirely naked.

In the portion of ground allotted to Garden Seeds, are grown almost every variety of Excellent Vegetable and flower seeds. The method pursued by the Proprietors in the breeding, is nearly universal, and their preference, with all who will consider the subject in the slightest degree. The preparation of these kinds, suitable to mix in sowing—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance, undoubtfully comprises an eminent degree, to obviate the errors and impositions, unavoidable from a dependence on foreign importations, or on any one who has not experienced growth at home. They are received by Parker & Company, No. 41 Congress St., Boston, of whom precedential notice of this kind may be had gratis. Persons calling may be assured of having every article well and safely packed, and forwarded.

MISCELLANIES.

ODE.

How sleep the brave who sink to rest,
By all their country's honors blest!
When spang, with dewy fingers cold,
Returns to deck their hallowed mould,
She there shall dress a sweeter sod,
Than fancy's feet have ever trod.
By Lary hands their keell is rung;
By forms unseen then dudge is rung;
There honor comes, a plumed gray,
To bless the turf that wraps their clay.
And Freedom shall awhile repair,
To dwell a weeping hermit there.

(From Custer's Recollections and private Memoirs.)

THE LAST HOURS OF WASHINGTON.

Twenty-eight years have passed away, since an interesting group were assembled in the death-room, and witnessed the last hours of Washington. So keen and unsparring hath been the seythe of Time, that of all those who watched over the patriarch's couch, on the 13th and 14th of Dec. 1799, but a single personage survives. On the 13th, the general was engaged in making some improvements in front of Mount Vernon. As was usual with him, he carried his own compass—noted his observations—and marked out the ground. The day became rainy, with sleet, and the improver remained so long exposed to the inclemency of the weather, as to be considerably wet before his return to the house. About one o'clock, he was seized with chilliness and nausea, but having changed his clothes, he sat down to his indoor work; there being no moment of his time for which he had not provided an appropriate employment. At night on joining his family circle, he complained of slight indisposition; and, after taking a cup of tea, repaired to his library, where he remained writing until between eleven and twelve o'clock. Mrs. Washington retired about the usual family hour—but becoming alarmed at not hearing the accustomed sound of the library door, as it closed for the night, and gave signal for rest in the well regulated mansion, she arose again, and continued sitting up, in much anxiety and suspense. At length the well known step was heard, and upon his entering the chamber, she kindly chided him for remaining up so late, (knowing him to be unwell);—to which he made this memorable reply:—“I came as soon as my business was accomplished. You well know, that through a long life, it has been my unvaried rule, never put off till to-morrow, the duties which should be performed to-day.” Having covered up the fire with care, the man of mighty labors at last sought repose; but it came not as it had long been wont to do, to comfort and restore, after the many and earnest occupations of the well spent day. The night was passed in feverish restlessness and pain. Tired nature's sweet restorer, (balmy sleep), was destined no more to visit his couch; yet, the manly sufferer uttered no complaint—would permit no one to be disturbed in their rest, on his account, and it was only at day-break he would consent that the overseer might be called in, and bleeding resorted to. A vein was opened, but without affording relief. Couriers were despatched, to summon Dr. Craik, (the family), and doctors Dick and Brown, as consulting physicians; all of whom came with speed.—The proper remedies were administered, but without producing their healing effects, while the pa-

tient, yielding to the anxious looks of all around him, waived his usual objection to medicines, and took those which were prescribed, without hesitation or remark. The medical gentlemen spared not their skill, and all the resources of their art were exhausted in unwearied endeavors to preserve this noblest work of nature.

Night approached—the last light of Washington! The weather became severely cold, while the group gathered nearer to the couch of the sufferer, watching with intense anxiety, for the slightest dawn of hope. He spoke but little. To the respectful and affectionate inquiries of an old family servant, as she smoothed down his pillow, how he felt, he answered—“I am very ill.” To Dr. Craik, his earliest companion in arms, longest tried, and bosom friend, he observed, “I am dying, sir—but I am not afraid to die.” To Mrs. Washington, he said—“Go to my escrutoir, and in the private drawer you will find two papers—bring them to me.” They were brought. He continued—“These are my wills—preserve this one, and burn the other.” Which was immediately done. Calling to colonel Lear, he said, “Let my corpse be kept for the usual period of three days.” Here we would beg leave to remind our readers, that in a former part of this work, we have said that Washington was old fashioned in many of his habits and manners, and in some of his opinions; nor was he the less to be admired on this account. The custom of keeping the dead for the scriptural period of three days, is derived from remote antiquity, not from fear of premature interment, as in more modern times, but from motives of veneration towards the deceased; for the better: enabling the relatives and friends to assemble from a distance, to perform the funeral rites—for the pious watchings of the corpse—and, for the many sad, yet endearing ceremonies with which we delight to pay our last duties to the remains of those we have loved best. The patient bore his acute sufferings with manly fortitude, and perfect resignation to the Divine will; while, as the night advanced, it became evident that he was sinking, and he seemed fully aware that his hour was nigh. He inquired the time, and was answered, “a few minutes to twelve.”—He spoke no more—the hand of death was upon him, and he was conscious that his hour was come. With surprising self-possession, he prepared to die—composing his form at length—folding his hands upon his bosom—without a sigh—without a groan—the Father of his country expired, gentle as though an infant died. Nor pang or struggle told, when the noble spirit took its noiseless flight; while, so tranquil appeared the manly features in the repose of death, that some moments had passed ere those around him could believe that the patriarch was no more. It may be asked, and why was the ministry of religion wanting to shed its peaceful and benign lustre upon the last hours of Washington?—why was he, to whom the observances of sacred things were ever primary duties, through life, without their consolations in his last moments? We answer, circumstances did not permit. It was but for a little while that the disease assumed so threatening a character as to forbid the encouragement of hope; yet, to stay that summons which none may refuse, to give still farther length of days to him whose time-honored life was so dear to mankind, prayer was not wanting to the throne of Grace. Close to the couch of the sufferer, rest-

ing her head upon that ancient book, with which she had been wont to hold pious communion, a portion of every day, for more than half a century, was the venerable consort, absorbed in silent prayer, and from which she only arose, when the mourning group prepared to bear her from the chamber of the dead. Such were the last hours of Washington.

An American printer having undertaken to publish an edition of Thomson's Seasons, was very much disconcerted with the following verses at the beginning of Spring:

O Harbord, fited or to shine in courts
With unaffected grace, or walk the plain
With innocence, &c.

He satisfied himself, that the first “or” was superfluous, and after some exercise of ingenuity, substituted the following, which we hope will be noticed by all future editors among the “curious readings.”

O Harbord, fited for to shine, &c.

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long Island, near New York.

IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who may be desirous of stocking their gardens and fields with Fine Trees of the finest sorts, and new and vigorous kinds the present season.

Orders may be sent to the Nursery, or by mail, enclosing all the orders of Horticulturists, and purchasers may rely with confidence, that the Trees they order will prove genuine. The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,
FLOWERING SHRUBS,
AND
PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him.

The reputation of this Nursery is so extensively known, and has been so well sustained, that it were tedious to refer those in want of Trees, to any of the Horticulturists in this City, and its vicinity; and if ocular demonstration is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

ICE Catalogues will be delivered gratis, on application to ZEB. COOK, Jr. Rogers' Buildings—Congress St.

TREES.

N. DAVENPORT offers for sale at his Nursery, in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Peaches, Prunes, Nectarines, &c. Gooseberry and Currant Bushes. A list of which can be seen at the office of the New England Farmer, or Agricultural Warehouse—and will be inserted in the New England Farmer occasionally. At this Nursery, however, it is not so much an object to present the imposing display of a great number of the names of different fruit as to keep a choice collection of those sorts, whose excellence is well known and established.

Orders are very readily solicited, and will receive prompt attention if left with J. B. DAVENPORT at the Agricultural Establishment, No. 52 North Market Street; or with FRENCH & DAVENPORT, No. 713 Washington Street—or at the Nursery in Milton. Feb. 29.

Seeds for Hot Beds

For sale at the Seed Establishment connected with the New England Farmer office, No. 52 North Market Street, Boston.

A large variety of fresh Garden Seeds, suitable for spring sowing of Hot Beds, among which are Bush Sweet Marjoram, Early Camperdown Lettuce, Sibbald do, Head do, Royal Cape Spinach, Tomatillo do, Ice Cream do, Green and White Cress do, Early York Cabbage, Early Button do, Early Butterhead do, Early Sugarloaf do, Early Dutch do, Green Globe Savoy do, Cape Savoy do, Early White Purple, and Cape Broccoli—Early and Late Cauliflower—White and Red coloured Celery—Gulfed Cress—Early Frame Cucumber, Green Cluster do, Long Green and White Turkey do, Long Pickled do, White Squared do, Short French do, Green Citron Melon, Pine Apple do, Minner do—Purple Egg Plant—Superior Short Top Scandlet Radish, Early Frame do, Cherry do, Early White Dutch Turnip, Yellow Malt do—Spinach, &c.

It is Published every Friday, at Three Dollars per annum, payable at the end of the year, or in advance, also pay within sixty days from the time of subscribing, are entitled to a deduction of 15% Cent.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ORCHARDING.

Notwithstanding the worth and excellence of a good orchard, there are comparatively few who appear to act as though they coveted its possession. The man of indolence says, I will not trouble myself to plant and cultivate an orchard, as it is uncertain whether I should ever realize any benefit from it, were I to make the attempt, and it is quite enough for me to get through the world without concerning myself for the ease and prosperity of those who come after me. But such reasoning must be considered as the offspring of a narrow mind and selfish disposition, altogether abhorrent to the views and feelings of him who is possessed of a spirit of philanthropy and enterprise. But there are instances within the observation of almost every one, which will go to shew that he that planteth an orchard frequently reaps the reward of his labor, besides enjoying the reflection that those who succeed him will remember him with gratitude and veneration in view of what he did, not only for his own comfort and convenience, but for the promotion of their wealth and happiness, after he shall have bid adieu to this world and its enjoyments.

One instance from among several within the sphere of my own observation, I will relate, it being directly to the point under consideration. A respectable farmer about 35 years ago, just settling out in the world and having nothing to encourage him but his own industry and enterprise, conceived the project of planting and cultivating an orchard. He first sowed a nursery from which he afterwards took trees and set them out on a rough uncultivated piece of ground, which by proper management he raised to a state of fertility and productiveness. He then engrafted his trees with a variety of the best kinds of fruit, and by devoting the necessary attention to the object of his undertaking, his orchard in a few years began to produce abundantly and he is now receiving the reward of his labor and enterprise, as it affords him an annual income, besides furnishing a sufficiency of apples and cider for family use and convenience. Thus by undertaking and accomplishing an object so valuable, he not only laid a foundation for a source of profit and enjoyment to himself, but which will continue to be such to his children and others after he shall have finished his course, and gone the way of all the earth.—Perhaps in no way can he who possesses suitable advantages, better provide for the enjoyment and happiness of his children, or those who may inherit his estate, than by rearing and leaving for their benefit a valuable orchard. All should cherish so much of a philanthropic disposition, as sacredly to regard the welfare and prosperity of those who may come after them, not allowing their own interest or self-gratification, to be the object of their pursuit. Therefore every one who owns but a small portion of land, and especially he who possesses a large territory, and has hitherto neglected to plant and cultivate a suitable number of apple trees, ought now to give his attention to the

subject, and immediately set about a work of so much importance, and in this way prove to the world that he is not destitute of a spirit of benevolence and manly enterprise. A FARMER.
March, 1828.

FOR THE NEW ENGLAND FARMER.

MELONS AND CUCUMBERS.

Different kinds of water melon, on arbours, are cultivated in surprising quantities in the southern parts of Russia, from the Don to the Ural, and particularly along the banks of the Volga. Their cultivation requires but little trouble; they thrive in the open air, only to the 52nd degree of northern latitude. The melon gardens from their size, might rather be called fields; they are inclosed with a slight fence, and are divided into long beds between which, in the oriental style, little canals are cut in the soil for watering the plants. For this purpose the gardens are always laid out contiguous to a pool, or to a streamlet of running water.

The white (skin) is eaten either raw, with powdered sugar, or ginger, or salted in the same manner as the cucumber.

Water melons are cultivated about St. Petersburg and Moscow under frames. What is principally necessary during their cultivation in this manner, is to take particular care not to injure the very strong and creeping shoots, which the plant sends out during its progress, but either to raise the frames and allow them to spread out into an adjoining one, or to keep them, by bending, entirely within its own, which, in that case ought to be long and roomy. The former way I should prefer. It is to neglecting this, that the gardeners in Russia attribute the general failure in the cultivation of the water melon in Great Britain. If the shoots are in any way checked, or injured, during their growth, the plant is observed to suffer considerably, and the future progress of the fruit towards maturity is either intercepted or totally destroyed; attention to this circumstance is of more consequence than heat, as is satisfactorily and daily proved in the northern parts of Russia. The skin of the melon may be eaten in the manner of celery.

THE CUCUMBER.

Large quantities are used in Russia, both during the summer in their fresh state, and during winter, when artificially preserved. The plant is generally cultivated in long rows along with cabbages; a cabbage and a cucumber plant alternately. It requires a rich soil, or soil well dunged. The Russians pay particular attention to this, covering the root of each plant with a small heap of horse or cow dung. For winter use the cucumber is preserved in salt. Before being eaten the outer skin is removed; the liquid which is charged with the salt and with the soluble portion of the vegetable matter, and which fills the cask in which the cucumbers are preserved, is used as a cooling-laxative in fevers, about a tumbler to a dose. A cask of these was sent to a distinguished member of the Horticultural society in London, and the cucumbers were much admired for their fine flavour.

The following is the receipt for preparing and salting the cucumbers. Take 1000 cucumbers, weigh out 7 lbs. of salt, which has been previously well purified, and dried, mix the salt with a quantity of cold soft water, sufficient to cover the cucumbers, 500 of which may be put into a small light made cask. Having ready plenty of the following leaves, which have been gathered when the weather was dry; oak leaves, black currant leaves, cherry leaves, dill leaves and heads; mix them together, and place a layer of them at the bottom of the cask; then a layer of cucumbers and thus alternately until the cask be completely full: then pour on the salt and water till it rises to the brim, and close the cask tightly. Some people add a small bottle of vinegar, and a very small bit of garlic to each cask. In two or three months the cucumbers are fit to use. They are brought to table entire, floating among the juice and leaves which cover them while in the cask. A Russian will often eat several at a meal and no bad effect is ever known to arise from their use. The Russian cucumbers have less fibrous matter than the English, which perhaps would not answer as well for preserving in this manner. But the Russian cucumber has found its way into England, and has been cultivated with success. The cucumber plants are also cultivated somewhat like grapes on palings and trellises, and in this way are also remarkable strong and the fruit large.

Cambridge, March 6, 1828.

FOR THE NEW ENGLAND FARMER.

POISONED SHEEP.

MR. FESSENDEN.—This being the season which requires particular attention to sheep, perhaps I may render some service to my brother farmers, by making public through the medium of your paper, a few practical observations tested by experiments of my own, relating to these profitable and necessary animals. Many farmers or wool growers seem to treat them with too much neglect, and others with too much care; some confine them closely, while others permit them to range at large. Too much confinement does not contribute to their health, and too much liberty exposes them to various evils, one of which is poison. This I believe is the sole cause of the destruction of more of this species of animals, than all the dogs in the universe, although the loss by these is very considerable. It is not my design to write a treatise on the management of sheep, but to state briefly what I know to be the way or manner in which this poison is generally taken, and to point out a specific remedy. Poison is most prevalent among them in the spring of the year, and is taken by them, as the first green herbage to which they generally have access in sufficient quantities to satisfy their hunger, in what are commonly called *lurel* and *white bush*, either of which is greedily eaten by them at this season. The symptoms, or rather the disorder itself, cannot be mistaken. It is a kind of intoxication, or insensibility, which, without proper treatment generally terminates in death, though life, in some instances, continues for many days. The remedy is but to give the poisoned animal a small lump of *butter*, (or a quantity of *oil* or *grease* of the skunk, by some called *polect*

the latter is said by some to be preferable, but the first, if given while the animal has sufficient life, or warmth, to enable it to swallow, or receive it into the stomach, effects a cure. The operation of either, is this: a nausea or sickness is soon produced which dislodges the poisonous vegetables eaten, and the cure is done. A FARMER.

WASH FOR FRUIT TREES

MR. FESSENDEN.—I have noticed in your New England Farmer's Almanac a recommendation of Major Wheeler's wash for fruit trees which is there inserted; and first published, with his remarks, in the N. E. Farmer, vol. 4, p. 445. In his communication he says—"The reason that it has not been more generally used is, that it has been fashionable to daub with lime, clay, manure and other compositions which take two or three years to wash off before the trees look natural. When this solution of potash is applied, it has the desired effect immediately. It kills the moss and lice at once; and the first rain that comes washes the bark perfectly smooth, and gives it a fair, natural and healthy colour." He further states that once in two to four years is sufficient.

I had the same recipe many years ago from Mr. Austin, Inspector of Pot Ash at Charlestown. I at first used this simple wash; but owing to it for the reason which constitutes Major Wheeler's secondary excellence—that the first rain that comes washes the bark perfectly smooth. If the design of the wash is to give vigour to the tree as well as to remove the moss and destroy the lice, the longer it remains the better; unless by being soaked among the roots by the first rain, it produces the same beneficial effect. This it might accomplish were a due quantity applied. But this could not be obtained in an intrusion of four or even two years. A repetition after every rain could alone be effectual. Nutrient of this kind may be taken in by the roots or imbibed through the bark. A limited quantity probably more readily by the latter, from atmospheric aid.

From this view of the subject I adopted the fashion to daub my trees with a composition of 2 lbs. of potash and 2 lbs. of unslacked lime, dissolved in 2 1/2 gallons of water, adding clay or cow dung to give it a firmer consistence and render it more porous. I also have no rule by which to renew it; but apply it early in the spring, when ever my trees appear to need it by having the substance washed off. To my view this fashionable coat is far from being an unsightly dress.—Were it otherwise I should consult health and vigor even at the expense of a homely garb. From what I know of Major Wheeler's science and practical skill, I suspect the flourishing state of his trees is to be ascribed more to his spading and manuring than to his occasional wash, which, however and whenever applied is a potent and valuable auxiliary. A FARMER.

Worcester, March 11, 1828.

FRUIT TREES

MR. FESSENDEN.—In stating facts and inferences declared them true respecting the disease of fruit trees, I hope to call farther attention to this interesting subject; and elicit truth without the heat of controversy.

I will concede to those gentlemen who believe it caused by an insect, and whose opinions are confirmed by having detected their adversary, that the same destruction may be effected by different

agents; and that the enemy which gives annoyance to them, is visible and tangible. If they can admit my theory I may presume they will allow that my foe is not of this palpable kind, since it has eluded a diligent and minute search, often repeated by myself and friends. Being thus baffled in my investigation I have sought its analogy to other diseases of the same insidious character, and have fixed upon the *Canker*. Here the same diversity of opinion respecting the cause presents itself. Mr. Forsyth is of opinion that canker is caused by injudicious pruning—from the fruit being left on the trees—from bruises—from dead shoots being left on the tree through the summer, &c.; but not from any thing peculiar in the soil. Sir Humphrey Davy attributes canker to the excess of alkaline and earthy matter in the descending sap. There seems to be some bearing in both these opinions on the disease in question. Some contumination or obstruction in the descending sap appears to me manifest. Canker, however, as it is generally understood, more commonly attacks the body or large branches of the tree; but if not eradicated in its incipient state, it will, like leprosy, corrupt and destroy its vitality.—Whatever may be the predisposing cause, this malady is hastened and confirmed by the direct agency of solar rays. I am led to this conclusion from noticing that the first appearance is found on the part of the tree exposed to the longest and the most direct influence of a summer's sun, bearing from a S. and S.W. point. If the tree declines from these points it becomes more exposed and seldom escapes infection. If there be a sudden bend to the N. E. and the tree again becomes erect, the intermediate angle will almost invariably suffer. If the rays of the sun are so potent as to penetrate thick bark and make it so closely adhere to the wood as to check the circulation of the sap, is it unreasonable to suppose that the same cause may produce a similar effect on the thinner covering of the extreme branches? This appears to be the question at issue; and further light is thrown on it by the fact that this disorder is confined to the most arid and hot season. It seems to be agreed that this disease is common to both apple and pear trees; but so far as I have noticed, is more extensive and destructive on the pear. On the pear tree, not only small shoots, but whole limbs are destroyed; whereas on the apple, like the quince it is confined to the extreme minor branches.

That the canker is contagious, and will produce the same destruction within its influence that is to be seen on the shoots of the apple tree, has been strikingly manifested in my nursery. A tree about ten years in bearing has been suffering with the canker for a few seasons past. Last summer while full in early fruit the branches all died.—The rows in my apple nursery extended under and beside it. After the leaves became dead, the tender shoots of the young trees under it turned black and perished. Thus I imputed to the dripping from the diseased tree of dew and rain, as the injury was confined to their vicinity of its branches. The disease however was to be discovered in some of our parts of the nursery.

Should further investigation determine the origin of this destructive malady it is still to be feared that the remedy will remain to disappoint our research. If I am correct as to its contagious character, the importance of severing the diseased parts is confirmed. But the whole subject seems

so involved in obscurity that I might be deemed too visionary, were I to be positive even in this opinion. Respectfully yours, &c.

Worcester, March 11, 1828.

O. FISKE.

SCIENTIFIC AGRICULTURE.

An Address delivered before the Hampshire, Franklin, and Hampden Agricultural Society; at Northampton, Oct. 24, 1827. By EDWARD HITCHCOCK, Professor of Chemistry and Natural History in Amherst College.

It is an interesting evidence of Divine Benevolence, that there is intermingled with the immensely varied pursuits of men, so nearly an equal portion of enjoyment. So wisely adapted to our circumstances are the laws of habit, that we soon become contented, and even pleased, with a situation, which seemed at first, the grave of all our comforts. But this is not all. There are sources of enjoyment in every occupation that are peculiar; that exist in no other. Hence it happens, as a general fact, that men have no wish to change employments with their neighbors. We may covet some particular possessions, or circumstances of our neighbor; but when the question is, whether we will entirely change situations with him, the preference we feel for our own profession or art, will, in most cases, give a ready negative to the inquiry. What but necessity will bring the sea tossed and hard faring sailor to settle down contentedly in the peaceful farm house with all its security, and all its plenty. On the other hand, what but irregular habits, or disappointed hopes, will tempt a man, who has become habituated to the pleasure of cultivating his own farm, to commit himself to the mercy of the waves and storms of the ocean. You may, indeed, draw the artisan abroad for a day or two in the summer, to relieve the pressure of the farmer. But he goes back again to his shop, gratified that an easier task is his, than to toil beneath a burning sun. I know that the hard laboring man not unfrequently looks with an envious eye and discontented feelings upon his rich neighbor, rolling past him in his coach; and upon the professional man, who is seen fanning himself in the shade, during the sultry heat of July, while he is compelled to go forth, unprotected, under the rays of a meridian sun. But let him only become acquainted with the corroding cares, the oppressive listlessness, the enmity, and the crowd of diseases that follow the chariot and watch around the dwellers of the affluent;—let him be told how much of anxiety and labour and sleeplessness the intellectual efforts and collisions of the professional man require; let him see in the wasted form and languid countenance of the scholar, what a sacrifice of health the acquisition of knowledge often demands—

—how hard it is to climb
The steep where Fame's proud temple shines afar;
—how many a soul sublime
Has left the influence of malignant star,
And wagg'd it with fortune, an eternal war;

let the laboring man but partially realize these things, and he will be thankful that he is neither very rich, nor very learned.

It cannot be denied, however, that some of the employments of men afford more numerous and certain means of happiness than others. Nor will many dissent from the opinion, that in this respect the pre-eminence must be awarded to agricultural pursuits. If, as the poet says,

"Reason's whole pleasure, all the joys of sense,
Lie in three words, health, peace, and competence;"

why has not the farmer the very essence of earth

ly happiness within his reach. So directly do his labours tend to promote health, that they are the resort of invalids from all other employments; and often form the physician's last and best prescription. Peace, too, if ever she finds a resting place in this disordered world, will fix her station in the retired mansion of the farmer. Nor will competence follow far behind, when health and peace and industry lead the way.

In the acknowledged fact that agricultural pursuits are more favorable to human happiness than any other, I see, if I mistake not, additional indications of the goodness of God. For this must be the employment of the great mass of mankind:—And to make it the easiest avenue to enjoyment, will, therefore, swell the amount of human happiness more, than if the like pre-eminence had been granted to any other art or profession. True, we have not now a paradise to cultivate: and the thorn and the thistle starting up on every side of us, are mementos of that curse which followed man from the Garden of Eden. Still, in that curse we perceive a mixture of mercy. The heart of infinite benevolence seems to have yearned to wards our guilty race, even at the moment when they were driven from Paradise, and the sword of a broken law turned every way to prevent their re-admittance. In the bitter cup that was given man to drink, there was mingled an antidote to the poison. Though he must henceforth eat his bread in sorrow and in the sweat of his face, yet would that very labor prove the greatest alleviation of his trials that could be granted to a fallen being.

In this light have almost every age and nation regarded agriculture. National and individual happiness has ever been known to be most intimately linked with the successful cultivation of the soil. We cannot say much, indeed, concerning the views and efforts of the antediluvians on this subject. We have but one history of those times, and this so concise, that it casts but a glimmering light on that long period of darkness. All the vestiges of science and civilization, that might have existed, have been swept away by the deluge: and the flood of the world has proved almost the flood of oblivion.

Nor are the ages that for a long time followed, involved in less obscurity. The building of the Tower of Babel indicates a state of prosperity, and an acquaintance with architecture; and hence we derive presumptive evidence in favor of a correspondent advancement in agriculture.

When the descendants of Abraham were securely settled in Palestine, they devoted themselves almost exclusively to agricultural pursuits, from the chiefs of the tribes to the lowest menial.

The Chaldeans made improvements in husbandry, before unknown. They seem to have ascertained some method of recruiting an exhausted soil, and were thus prevented the necessity of frequently changing situations, like most other Oriental nations.

The proverbially fertile soil of Egypt enabled its inhabitants every year to raise vast quantities of corn: and so highly was agriculture esteemed among them, that they ascribed its invention to their chief god, Osiris: and even paid divine honors to the animals employed in cultivation, and to the products of the earth.

In India, too, in ancient times, Bacchus was worshipped as the inventor of planting vineyards, and other agricultural arts.

The Persian kings, also, once each month, laid aside the splendor of royalty, and ate with their husbandmen. Agriculture was incorporated into their religion; and it was one of their maxims, that he who sows the ground with diligence, acquires more religious merit, than by the repetition of ten thousand prayers.

The Phenicians or Phisiticians, and the Carthagenians, were not unacquainted with agriculture: and Mago, a celebrated Carthagenian general, is said to have written twenty eight books on the subject, which were translated into Latin by command of the Roman Senate.

The ancient nations of Europe seem to have been much behind the Asiatics in their acquaintance with the cultivation of the soil; for we find the early Grecians deriving their subsistence, like the wild beasts, from roots, herbs, and acorns.

The Ath-nians, however, ere long found that the bosom of the earth was not made merely to tread upon. Their princes recalled their subjects from predatory warfare to learn the peaceful arts of husbandry. The other States of Greece soon followed the example, and agriculture rose into a regular and important art. Their first writer on the subject was Hesiod, who embellished his work with the imagery and harmony of poetry. Zenophon, Democritus, Aristotle, Theophrastus and others, employed their pens upon the same subject.

The high regard in which agriculture was held among the Romans is well known. Even their most illustrious Senators and commanders in the intervals of public duty, devoted themselves to its pursuits. Regulus requested to be recalled from his command in Africa, that he might attend to the cultivation of his farm. And Cincinnatus received the summons to lead the armies of the republic when following the plough: and when that call of his country had been obeyed, and success had crowned his arms, he returned again to his interesting occupation. Cato, the Censor, composed a treatise on the subject. Varro followed him in a more regular work: and finally, Virgil gave immortality to Roman agriculture, in his Georgics. An art thus patronized by the rich and powerful, and occupying the attention of the learned, must have been carried to a considerable degree of perfection: though the want of any thing like a correct theory of agriculture, and the substitution of numerous superstitious notions, must have greatly impeded its progress.

But the Roman power was now on the wane. Corruption had fixed upon the vitals of the State, and this vast fabric of empire, which was impregnable to all foreign assaults, must sink by the slow workings of internal disease. Long did Rome linger over her fall: But at length the huge pile of Gothic barbarity and ignorance was raised on her ruins. For more than ten centuries, a thick darkness brooded over the world. Religious intolerance and superstitious ignorance, those spirits of night, wielded their two edged swords over the human mind, and lopped the first bud-dings of genius and truth. Though here and there a feeble light was seen, breaking through the darkness, yet it was not till the middle of the fifteenth century, that science and art were seen rapidly rising from the chaos. In 1478, Crescen-zio a Florentine, published a valuable treatise upon agriculture: and he was followed by many of his countrymen in the same track.

(To be continued.)

REMEDY FOR THE WHOOPING COUGH

Dissolve a scruple of salt of tartar in a gill of water, and ten grains of Cochineal finely powdered, and sweeten this composition, so as to render it palatable with fine loaf sugar. Give to an infant the fourth part of a table spoon full, four times a day. To a child 2 or 3 years old, half a spoon-full; and to one 4 years old and upwards, a spoon full may be given. The relief afforded by this remedy is immediate, and generally a radical cure is effected in 5 or 6 days.

The above medicine has been used for several years past in cases of whooping cough, by eminent physicians, with the greatest success; and its salutary effects have been singularly experienced in many families.

The High Cranberry.—Few people seem to be aware that this shrub, or small tree, which grows plentifully in the marshes and swamps around us, yielding rich clusters of very handsome fruit, a delicious tart, may be cultivated with ease and success in our gardens and shrubberies. Without knowing that the attempt had ever been made, I tried it last spring, with some half a dozen shrubs, from Saratoga county, all of which bore the transplanting very well, for they lived, grew as vigorously as most vegetables do the first year, and some of them bore fine bunches of fruit.—The twigs, taken off, put out as cuttings also took, which shows with what facility we may stock our gardens with cranberries.

To clean moulding of carriages.—Take one table spoon full of rotten-stone, finely levigated, two ounces and a half of spirit of vitriol, two ounces and a half of spirit of wine, and one pint of water. Put the spirit of wine in last, and a few small pebbles to help in shaking. Apply it with a piece of thick flannel, then rub it off with a piece of moist leather, afterwards with a dry flannel.

Oneida Lake.—Among the documents received from our Albany correspondent, is a report in favor of lowering the Oneida lake, and the improvement of the navigation of the Oneida river. The object is two fold—1st. To reclaim large tracts of rich sunken lands adjoining the lake, by which operation the healthiness of the surrounding country will be greatly improved; and, 2dly, The improvement of the navigation of the river, in such manner as shall admit of steam-boat navigation from Lake Ontario to the head of the Oneida.—This would be truly a vast and valuable improvement.—N. Y. Adv.

Horse-chestnut dye.—A permanent buff, or nankeen dye for muslin, linen, cotton, silk, or woollen cloths, may be obtained from the horse chestnuts. For the buff color, take the whole fruit, husk and all, when quite young, cut it small, and put it into cold soft water, with as much soap as will just colour or discolor the water. When deep enough, pour off the clear part, and dip whatever is to be dyed, till it is the color required. For the nankeen color, take the husks only, cut or break them small, steep them in soft water, with soap, (as above) and dye it in the same manner. The husks may be used for the buff dye, after the kernels are formed; but it is only when they are the most imperceptible that the whole fruit is used—and the brightness of the buff color diminishes as the husk ripens, till when quite ripe the dye is most like nankeen.

[Extracts from Loudon's Gardener's Magazine for Jan. 1833.]

An approved Method of obtaining a Crop of Early Cauliflowers, a week or ten days before those treated in the usual way. By J. M.

From a seed-bed which has been sown two or three days after rather than before the customary period, select a score or two of healthy plants.—Pot them singly into the smallest-sized garden-pots in rich loamy compost; water, and plunge them in a cold frame, shading for a short time, till they have taken root. Afterwards give air daily, drawing on the lights at night, and defending from severe frost with a mat or two; water frequently with tepid manured water, and keep clear from decayed leaves and weeds. Examine the state of the roots from time to time, and, as soon as they become in the least degree matted, immediately shift into 48-sized pots, with the before-mentioned compost; and replace them carefully in the same frame, attending to them as before. When the roots have nearly filled these last pots, shift into thirty-tvos, and, in due time, they will ultimately require twenty-fours; or, if they have grown rapidly, even eighteens. After being fairly established in these, they may be removed into a vineyard, peach, or other forcing house, there to remain till the end of March or beginning of April when they may be turned out into the open air between the asparagus beds, or any other warm and well sheltered spot. They will require to be put in pretty deep, and protected by hand glasses, or at least by boughs of trees, that they may not suffer from the sudden transition or inclement skies. It is hardly necessary to add that the whole success of this mode of culture depends entirely on the plants receiving no check in any stage of their growth, either from want of timely re-potting, water, air, or sufficient protection from frost. While in the house, if not supplied with water in pans, they are very liable to button, and thereby wholly defeat the end in view.

The Lincolnshire Agricultural Society has given a prize of ten guineas to one man, for having had seventeen children (ten living) and been forty years in the service of one master; and another of five guineas, for twenty five children gotten (ten living) and a service of forty-one years.—These premiums seem to have been well merited by the length of service; but, as to the children, there is something revolting in rewarding persons for calling twice as many beings into existence as they were able to nourish and bring up. Premiums for early marriages and large families may be very suitable for new countries like America.

The powder of horse chestnuts being mixed with a third of flour, is found to make better paste than that made from flour alone. (*Mec. Mag.* viii. p. 223.) We are glad to observe that these nuts can be applied to some useful purpose, and hope some country shoemaker or bookbinder will take the hint.

Small farms are rapidly melting away on the Marquess of Lansdowne's property in Queen's county. The farm houses are constructed on an excellent plan, such as promises comfort, and gives temptation to cleanliness, a desideratum in the rural life of Ireland; and magnificent allowances are granted by this nobleman out of the landlord's rent, towards insuring a sufficient interest, and an inducement to seek after the enjoyment of comforts.

An undescribed Shrub, which supplies wholesome and limpid water, has been discovered in our new Indian countries, from whose stem, when divided there issues a copious vegetable spring of limpid and wholesome water.

SUGAR from Beet Root.—At a dinner recently given by the town of Amiens to the King of France, there was placed on the table, opposite His Majesty, an immense column composed of sugar, manufactured from the Sugar beet root, at Franvillers, near Amiens. The column consisted of four different qualities of refined sugar, and crystals of raw sugar formed the pedestal. The manufacture of sugar from beet-root seems to be making great advances in France.

Myrrh.—A reward of 25*l.* or a gold medal of equal value, has been offered by the Medico-Botanical Society, for an accurate description of the plant yielding the myrrh, which is supposed to be merely the produce of the *Amyris Katuf*.

Burnt Poterium sanguisorba, so much used by the French and Italians in their salads, is of so cheering and exhilarating a quality, that it has passed into a proverb in Italy, that no salad can be good without it.

Mulberries and Walnuts.—One of the characteristics of the present age is the quickness with which productions are obtained, for which formerly we were obliged to wait many years. A friend of mine, who has not planted his garden more than two years, has already gathered mulberries and walnuts; the latter are from considerable trees, which had borne in the nursery before removal, and which were obtained from Harrison and Co. from Brompton; the former are from standard trees from Lockman's nursery, Camberwell, which contains the largest plants of this tree in the trade; many of them have born fruit for two or three years, and when removed to a private garden with care, will bear the first year.

A selection of names of hardy Fruit trees is just published, in one sheet or table, by Mr. Edward Lindsay, nurseryman, Belfast. It is accompanied by an engraving, representing the mode of training dwarfs and standards. Gentlemen in Ireland might write for it to be sent by post.—When a second edition is called for we would recommend Mr. Lindsay to compare the spelling of the names with that of the Horticultural Society's catalogue.

Extracts from Nuttall's Introduction to Botany.

Nearly all the fine fruit trees and flowers of the family of the ROSACEÆ which we generally cultivate, originate in temperate climates. The apple has been obtained from the wild Crabtree of Northern Europe; the Pear from the very unpromising wilding of the same country, but bears a warm climate better than the apple. The Quince (*Cydonia*) is found in wild hedges and rocky places in the south of Europe. The Plum (*Prunus domestica*) is likewise indigenous to the south of Europe, but scarcely eatable in its native state. That variety called the Damason, or the egg-shaped plum, was probably introduced from Syria. The Peach (*Amygdalus persica*) is the produce of Persia. The Almond occurs wild in the hedges of Morocco. The Cherry (*Prunus cerasus*) is the product of Cerasonte; the Apricot of Armenia; the Pomegranate (*Punica granatum*) of Persia and Carthage.

One of the most important grasses, for cultivation in the middle states, is certainly the Orchard-grass (*Dactylis glomerata*), a stout and tall grass, bearing a panicle or irregularly branched flowering culm, terminating in many rough clusters of small, flat and pointed glumes, all in each lobe or cluster inclining one way, and nearly all the same form and consistence. The seed is small, and falls out of the glume when ripe, though not very readily. The leaves have almost uniformly a plated or wrinkled margin when they first expand.

The Darnel, Tare or *Lolium*, produces its flowers in a spike almost in the manner of wheat, but the calyx consists of but a single outer valve, and contains a spikelet of many equal flowers like a *Festuca*. The common species, here naturalized, is perennial, and has beardless flowers; the annual kind, in Europe, though, I believe, seldom in America, overruns fields of grain, and where mixed in any considerable proportion with wheat, which it resembles, though less in size, produces a bread which is deleterious, and apparently intoxicating.

The delightful and well known vanilla odor of new hay is chiefly produced by the presence of the Vernal grass, or *Anthoxanthum odoratum*.—The flowers, when mature, form a yellow chaffy spike; the calyx, thin like that of the oat, includes a flower which, at a late period, assumes a brownish tinge, and falls out inclosing the seed; each of its valve produces an awn, one of them nearly from the base, the other from near the tip of the valve; there are also two minute abortive rudiments of flowers, near the base of the true flower glume. This grass is likewise remarkable for producing only two, in place of three stamens.

Without possessing anything specious in their flowers, no class of flowers add so much to the beauty of the landscape as the grasses: their presence marks the distinction between desolate sterility, and verdant plenty; a very important part of the food of man, and the whole of that of his principal domestic animals depend upon this important tribe of plants. The industry of man is requisite to the very existence of the grain he employs for food, while that part of this family necessary for the food of animals is every where spontaneous, and perennial, and scarcely denied to any climate in the world.

At a meeting of the Hartford Agricultural Society, holden on the 27th February, 1828, the following gentlemen were elected honorary members: Hon. Gorham Parsons, of Ms.—Hon. John Amory, of Mt.—John S. Skinner, Esq. of Balt.—Hon. Jonathan Roberts, of Penn.—Hon. William Jarvis, of Vt.—Hon. H. W. Dwight, of Ms.—Hon. S. T. Hosmer, of Con.—J. Prince, Esq. of Ms.—Hon. J. Wells, of Ms.

The bills for the improvement of Connecticut River, and for the extension of the Hampshire and Hampden Canal have passed the House of Representatives in Massachusetts.

Monument to Governor Clinton.—A meeting was held at Buffalo on the 2th, to concert measures for the erection of two monuments to the memory of Dewit Clinton, to be located at the extremities of the Erie canal, at Buffalo and Albany; and to appoint a committee who shall act in concert with a like one of the city of Albany, in furtherance of the proposed measure.

TURNIP CABBAGE.

It is surprising that this valuable vegetable (the *Kohl-Rabi* of the Germans, *Chou-Rave* of the French,) of which large quantities are regularly sold the whole summer in the German markets, is not more cultivated in England, as it is little inferior to the cauliflower; and yet, from its requiring less care and room, can be grown at a price so much lower, that a given weight of cauliflower, in the market of Aix-la-Chapelle, costs five or six times as much as the same weight of kohl-rabi.—The mode of cooking, however, makes all the difference. Half-boiled, in the English way it would be little thought of, but when cut as in Germany into small oblong pieces, and thoroughly though slowly boiled, or rather stewed, it forms an excellent dish. The average diameter of the *bulb* (for one more appropriate, to the globular enlargement into which this variety of the cabbage tribe expands, just above the ground,) is from 3 to 4 inches, but is often grown much larger. One purchased in the market of Aix-la-Chapelle, in October last, measured 18 inches in circumference, and weighed (exclusive of leaves and root) 4 lbs. 9 oz. Prussian weight. It could not be estimated to have cost more than one half-penny English; and having been cooked separately, by way of experiment, made a large dish, more than enough for five persons, at dinner though no other vegetable was eaten, as it was preferred to all the rest at the table.—*Loudon.*

From Cobbett's American Gardener.

FLOWERS AND ORNAMENTAL GARDENING IN GENERAL.

POLYANTHUS.—Every thing that has been said of the auricula, may be said of this. It is a very pretty flower and universally esteemed. Blows best out of the hot sun. Polyanthuses are best in beds, for a great part of their merit consists of the endless variety which they present to the eye. They have a delicately sweet smell, like that of the cowslip.

POPPY.—A very bad smell, but is sought after on account of its great variety in size, height, and flower;—and on account of its gayness. The seed pods of some are of the bulk of a 3 lb. weight, while those of others, are not so big as a small pea. The smallest, however, contains about one thousand seeds, and come up and flourish: with very little care. A bed with two or three hundred sorts in it, is a spectacle hardly surpassed in beauty by any thing in the vegetable creation. It is an annual, and well known as a medicinal plant; but, is not so well known as a plant from the seed of which salad oil is sometimes made. The Germans, on the Rhine, cultivate whole fields of it for this purpose.

PRIMROSE.—A beautiful little flower, of a pale yellow, and delicate smell. Comes early in the spring, and continues a good while in bloom. Of the fibrous rooted flowers it is the next to the daisy in point of earliness. It is an universal favorite; and, in England it grows abundantly in woods, pastures, and banks. It is perennial, like the cowslip, and is propagated in the same manner.

RANUNCULUS.—A flower of the nature of the anemone, and is propagated and cultivated in the same manner. These two flowers are usually planted in beds, where they make a very fine show.

RHODODENDRON.—This is a beautiful shrub, with a long narrow leaf, and great bunches of blue pink or white flowers; the buds, or pods, containing which appear the year before the flowering.

ROSES.—It would require volumes to describe the variety and excellencies of this plant. They may be propagated from seed; but as the seed seldom comes up till the second year, they are (except the China rose) propagated by suckers.—These come out near the old stems, during the summer, and are dug up in the autumn and planted out. In the spring they are cut down near the ground, and the next year they blow. The China rose is so easily raised from cuttings, that little bits put in the ground in the spring, will be trees and have a profusion of blossoms before the fall. It stands the winter very well, and is beautiful for the green-house.

SYRINGA, OR MOCK ORANGE.—A very stout shrub, with blossoms much like the orange, and with a powerful smell. Is propagated from suckers, of which it sends out a great many.

SWEET WILLIAM.—A pretty flower—makes a fine show—comes double by chance—and is very handsome, whether double or single. Is propagated from seed, the plants from which do not blow till the second year. The sweet William root does not last many years. It may be propagated by parting the roots; and this must be done to have the same flower again to a certainty, because the seeds do not, except by chance, produce flowers like those of the mother plant.

TUBE-ROSE.—This is a bulbous rooted plant, that sends up a beautiful and most fragrant flower. It is a native of Italy; propagated and managed precisely like the hyacinth.

TULIP.—Beds of these, vie with those of carnations and auriculas. A single root of the tulip has sometimes sold in England for two or three hundred guineas. There is an endless variety in the colors. The bulbs, to have fine flowers, must be treated like those of the hyacinth. The tulip may be raised from seed; but it is, as in the case of the hyacinth, a thousand to one against getting from seed a flower like the mother plant.

VIOLET.—This is a little creeping plant that comes on the banks under the shelter of warm hedges. It excels in sweetness. There is a purple and a white. The plant is perennial, and abundance of seed is borne annually by both. If you propagate from seed, the flower does not come till the second year; but, one plant, taken from an old root, will fill a rod of ground in a few years.

WALL FLOWER.—It is so called, because it will grow, sow itself, and furnish bloom in this way, by a succession of plants, for ever, upon old walls, where it makes a beautiful show. It bears abundance of seed, plants from which produce flowers the second year. Some come double. If you wish to be sure of double ones, you must propagate by slips of double-flowering plants. There are the yellow and the mixed, partly yellow and partly red. All have a delightful smell, blow early, and are generally great favorites.

RYE GRASS.

This is a more hardy sort of grass, and will grow on any land; but it thrives best on sour, clayey, and weeping grounds; it neither receives damage from the searching heats of the summer nor the piercing frosts of winter. It is the best of all winter food for cattle, the shorter it is eaten the better, and it springs earlier than any other. There is no danger of overstocking it, for if it be left to grow too much, the stalk will become hard and sticky. It is best for horses and

sheep, and very much prevents the rot in the latter. The best way of sowing it is with clover; and the common quantity of seed is two bushels to an acre; though in some lands where the clover is likely to succeed very well, they sow eight pounds of clover seed, and one bushel of rye seed to an acre, and this makes a crop that will last seven or eight years. Some mow it as hay, and thresh it for the seed. An acre of grass, will sometimes produce four or five quarts of seed. If at any time a field of this grass is found to grow thin, it is only necessary to strew on a bushel of the seed, and roll it with a roller, and the plants rising from this addition will make the whole crop sufficiently thick. Rye grass has this peculiar advantage, that it kills weeds without any other sown plant; even thistles cannot grow among it. When rye grass is cut for hay before perfectly ripe, the hay is the better; but the seed will not grow so well. When the seed is newly threshed, it must not be laid too thick, for it is apt to heat, and will therefore be unavoidably spoiled.

Cobbett's Nursery, Kensington, Feb. 7.—Some of our readers having requested us to give an account of his garden, we called there with a gentleman who was about to purchase some trees. We found the veteran writer sitting in his garden house, by a wood fire made in one of his cast-iron American stoves, a table beside him covered with newspapers, a few old books behind on a shelf.—The garden contains about four acres of deep sandy loam, admirably adapted for raising seedling trees, and almost the whole of it is so occupied. Among them is the Locust; the particulars respecting them are taken from the Register for Dec. 1825.

Locust, Robinia Pseud-Acacia. Recommended to be grown for pins for ship-building, and for hop-poles; also for fuel and hedges. The duration of locust is said to surpass that of all other timber; it grows faster than the ash, and while a pole of the latter tree lasts only three years, a locust pole will last twenty or thirty. At Earl's Court, near Kensington, a plantation was made, fifteen years ago, of locusts, Scotch pines, sycamores, limes, Spanish chestnuts, beeches, ashes, and oaks, and measured in October last. It was found that the locust grew faster than any other tree, in the proportion of 27 to 22. It is acknowledged, however, that the locust is not a tree to thrive to a great age; and two old specimens in Mr. Cobbett's garden, in the most favorable soil and situation, are striking proofs that it is not a tree to produce a great bulk of timber.

Remedy for Poison.—The following singular remedy is used much by the Hottentots, and by many of the colonists, who have borrowed it from them. When a person is bit by any of the more venomous snakes, a rowl is instantly procured, and the fleshy part of the breast being cut open, it is pressed fresh and palpitating to the envenomed wound. The virus is by this means, rapidly abstracted; and if the poison be very deadly, the fowl speedily exhibits clear proofs of its malignancy, becomes drowsy, droops its head, and dies. It is withdrawn and a second cut open and applied in the same manner; a third, if requisite, and so on, until it appears, from the decreased influence in the poison on the fowls, that its destructive virulence is effectually subdued. The worst crisis is then considered to be past, and the patient in most cases recovers.—*Low Weekly Rev.*

Poultry.—It is said that hens may be made to lay eggs during the winter season, when their laying powers are usually dormant, by the following cheap and simple means: Dilute and mix two ounces glauber salts in a dish of cold porridge, or any other food, and scatter the same well about the poultry yard, so that neither of them shall eat too much; if the effects are not apparent in two or three days, repeat the dose at short intervals, till the accumulation of eggs indicate that you have gone far enough.

[From the Winchester Republican.]

THE VINE.

Presuming it would not be unacceptable to your readers, I offer a statement of my progress in the cultivation of the vine. Having by long experience, discovered that the farming business is extremely precarious, owing to the ravages of the fly, together with unfavorable seasons, &c. Having perused various treatises on the cultivation of the grape, I determined on trying my success in a business to which I had been hitherto a stranger. In the autumn of 1824, I employed a vigneron from Switzerland, who represented to me that he had been long acquainted with the business; who during the succeeding winter, prepared about two acres of ground, of a south exposure, and of very thin, unproductive and slaty soil, but such as was preferred by him, although I protested against the location, and recommended other situations which I conceived would be far more productive; but being a stranger to the business, I yielded to his superior judgment. During the months of February and March 1825, I procured from Major Adams, near Georgetown, 2,000 cuttings, at thirty dollars per thousand, exclusive of a considerable number from gentlemen of this and the adjoining counties, amounting in all, to about 3000. These were planted during the aforesaid months in the following manner: The cuttings, (about two feet and a half long) were laid in rows seven feet apart one way, and three and a half the other, in a horizontal position, in trenches about two feet long, one foot wide, and about one foot deep, allowing from one to two buds to appear above the surface, and filling up and packing pretty close with the surface of the ground, which was carefully preserved for that purpose in excavating. The season proved unfavorable, and I presume that not more than about one half vegetated the first year, which produced a small quantity of grapes the next season, (1826); and, in 1827, my vigneron sold a considerable quantity of grapes, and made about fifty gallons of wine. I have now increased the size of my vineyard to between five and six acres, continuing to reset where the cuttings had failed to vegetate. All of them now appear in a flourishing condition. It will appear by the foregoing statement, that my first planting will have been only three years; and that planting, after deducting such as failed to vegetate, can only be estimated at about an acre. From the proceeds of the last, I think I can safely calculate on from five to ten barrels of wine the approaching season. Thus it will appear, that either the climate the soil, or both are better adapted to the production of the vine, than any which had heretofore come under my observation; as those of the United States, who have preceded me in the business, generally state the bearing as very inconsiderable until the third year, whereas my first planting bore luxuriantly on the second. Ploughing and

the cultivation of the ground, I find, is attended with about the same labor as an equal quantity of ground in corn, and the cultivation of the vine is also easy and simple. JOSIAH LOCKHART. Back Creek Valley, Frederick county, Va.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 14, 1828.

PEAS.

Of the small early kinds of peas, one pint will sow [according to London] a row of twenty yards, for the larger sorts for main crops, the same measure will sow a row of thirty-three yards. The drills for the early sorts may be one inch and a half deep; and two feet and a half, three, or four feet asunder, according to the height to which the peas usually grow. Peas that are to grow without sticks, require the least room. For summer crops and large sorts, make the drills two inches deep, and four, five, or six feet asunder. The distances along the drill should be according to the size of the peas and the season. The frame, three in the space of an inch; the charlton, hotspur, and dwarf marrowfat, two in an inch; the Russian blue and middle sized sorts, three in two inches; the large marrowfat or Knight's, a full inch apart.

Soil and situation. The soil should be moderately rich, and the deeper and stronger for lofty growers. Peas are not assisted, but hurt by unreduced dung recently turned in. A fresh sandy loam, or road stuff, and a little decomposed vegetable matter make the best manure. The soil for an early crop can hardly be too dry.

To forward an early crop. Sow in lines from east to west, and stick a row of spruce, hemlock, or pine branches along the north side of every row, and sloping so as to bend over the plants, at one foot or eighteen inches from the ground. As the plants advance in height, vary the position of the branches, so as they may always protect them from the perpendicular cold or rain, and yet leave them open to the full influence of the sun. Some cover during nights and in severe weather, with two boards, nailed together lengthwise, at right angles, which forms a very secure and easily managed covering, but excludes light.

Sticking peas. All peas fruit better for sticking, and continue longer productive, especially the larger sorts. Provide branchy sticks of such a height as the sorts may require. For the dwarfs, three feet high; for the Charlton and middle sized, four or five feet; for the marrowfat and larger kinds, six or eight feet; for Knight's and other tall marrowfats, nine or ten feet. Place a row of sticks to each line of peas, on the most sunny side, east or south, that the attraction of the sun may incline the plants towards the sticks. Place about half the number on the opposite side, and let both rows stand rather wider at top than at the ground.

LEGISLATIVE BOUNTY.

Extract of a letter from a distinguished member of the Pennsylvania Legislature, to the Editor of the N. E. Farmer:

"The inclosed Bill has passed the Senate, and I think will become a law. Such a machine as it contemplates, would have in this State, effects similar to those produced by Whitney's Cotton Gin in Carolina."

By the bill alluded to the sum of TEN THOUSAND DOLLARS is granted by the Pennsylvania Le-

gislatore to the person who on or before the first day of March A. D. 1835, shall before commissioners to be appointed for the purpose by the governor, exhibit and try the most perfect machine or machinery for dressing and reducing flax or hemp without dew or water rotting to the state fitted for manufacturing a cloth which shall satisfy them by such trials as they shall deem proper that the said machine or machines are fitted to effect the objects aforesaid, and that the expense of constructing, erecting, keeping in repair and working said machine shall not be too great for the purposes contemplated by this act, and who shall secure to the citizens of this commonwealth the right of employing said machine or machines free of any charge whatever."

We extract the following from Arthur Young's *Agricultural Travels in France, Spain, and Italy*; Vol. ii. page 165:—"When Louis XIV. beggared his people in order to place his grandson of France on the throne of Spain, and to acquire Flanders and Alsace, he would have rendered his kingdom infinitely richer, more prosperous, and more powerful, had he banished the naked fallows from half a dozen of his provinces, or introduced turnips in some others. There is scarcely a step he could have taken in such improvements of his agriculture, which would not have given him more subjects and more wealth than any of his conquered provinces, every acre of which was purchased at the expense of ten of his old acres rendered waste or unproductive; nor was one Fleming or German added to his subjects but at the expense of five Frenchmen."—*American Farmer.*

A gentleman from Bridgeton, N. Jersey, about 40 miles south of Philadelphia, informs us that Peach trees are in blossom, in the vicinity of that place.—*Penn. Gaz.*

It is said the question of the N. E. boundary of the United States, is referred to the umpirage of the Emperor of Russia, that an agent is to be appointed from Maine to manage the cause, and that Judge Preble is a candidate.

Cure for deafness.—Equal parts of the juice of house-leek, brandy, and sweet oil, put in a phial, and hung up exposed to the sun for a month or more. This dropped in the ear at night, and likewise on some wool to be kept in the ear, is a sure remedy for the above disease.

He who lives after nature shall never be poor: after opinion, shall never be rich.

To raise early potatoes.—Take the potatoes whole and cover them with horse litter of a moderate warmth—let them remain there till they put forth shoots of four or five inches in length, which they will do in two or three weeks—then take them carefully from the litter, and put them perpendicular, and equal with the surface, in a light dry soil, with more horse manure. If the season be tolerable, they will vegetate amazingly fast. In cold countries, the last week in April, or first of May, is early enough to venture them out.

Age and Industry.—Mr. Silas Wilder, of Stirling, in this State, aged eighty years, has made since the first day of January, 1828, twenty-three whole and twenty half run barrels. His sight is so good as to enable him to read with the use of glasses.—*Mass. Spy.*

Drinking Songs.—The wine countries have fewer poets who have sung the virtues of this heart-rejoicing liquor than the beer countries; the fact is, while in the latter the people sing about it, they drink it in the former. It is the same as with love songs: a poet will often sing the beauty of his mistress, but rarely that of his wife.

Rose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 30 hundred-leaf Rose bushes—20 do. Provence, or Cabbage 10 do. four seasons—300 do. Damask—30 do. Burgundy—5 do. Austrian—25 do. Marble—10 do. Tuscan—100 do. French—5 very large pots monthly flowers sixteen years old, and in prime health—7 varieties Double Dutch—single, do.—3 Lagerström—India, or Cape Myrtle, two of which are 30 years old—300 Grape Vines, (White Sweet-water)—Snow-ball Bushes—White Lilies—Red and White Lilies.

ROSE WATER.

20 Demijohns Double and Single distilled Rose Water, made entirely from Damask Roses. The above Rose Water is constantly kept for sale at Mr. C. Wade's Porter Cellar, No. 12 Merchant's Row, by Demijohn or less quantity.

Wanted

A MAN to take charge of a valuable Dairy and Farm, within 12 miles of Boston. To one who can produce unlimited cream from his cows, liberal terms will be offered. Apply at the office of the N. E. Farmer.

Fruit and Ornamental Trees.

The KENRICK NURSERIES in Newton, near Brighton, are the most extensive in New England. Gentlemen in want of Trees, are invited to call—examine for themselves—and make their own selections. The Apple and Peach Trees are extraordinary in size, variety, and fruitfulness.

Written orders addressed to JOHN or WM. KENRICK, and sent to the Newton Post-office, or left with Joseph Bridge, agent, in Court-street, where Catalogues may be had gratis; will be carefully attended to. Trees will be suitably packed for shipping or land conveyance, and delivered in Boston as desired. Gentlemen living at a distance, however, should have agents in the city to receive and pay for them.

Greenwich Garden.

Carmine and Variegated, not five minutes walk from St. Thomas Church, Broadway, along Houston-street.

D. KENNEY, Proprietor of this Establishment, grateful for patronage, and the liberal encouragement he has experienced for a number of years, begs leave, to inform his friends and the public, that he has received his sub-annual importation of Bulbous Flower-roots—Garden Seeds—Fruit Trees, &c. of every description; all of which are in excellent preservation, and will be sold on the most reasonable terms. The importations are from the first firms in England, France, and Holland, and are guaranteed to be of good quality, and not inferior to any general satisfaction, in the Agricultural, Horticultural, and Florist. A choice collection of Green-house Plants—also highly Herbaceous Plants many of which are very rare and scarce. Also, a choice collection of Rose Bushes, many of which, originally raised from seed by him; are new, and not in any other collection, for which a premium has been awarded by the New York Horticultural Society. Other Shrubs and Trees, in great abundance. The Hyacinths, Narcissus, Crocus, &c. are now in bloom, will continue in succession the greatest part of the year; and will be well worth a visit to the Garden and Green house, by any lady or gentleman in or near the city.

Bestiaries, furnished. Grape Vines, Trees, and Shrubs pruned, cut, transplanted, and grafted. Also, various Plants of the first quality. Catalogues may be had at the Garden gratis. Orders from any part of the Union will be strictly attended to. Gentlemen supplied with experienced Gardeners. Likewise, situations got for Gardeners of industrious, sober habits, and that perfectly understand their business, none other need apply. New York, March 14.

Fruit Trees.

WILLIAM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the Apple—202 do. of the Pear—76 do. of Cherries—33 do. of Plums—25 do. of Apricots—21 do. of Peaches—20 do. of Nectarines—10 do. of Almonds—14 do. of Mulberries—6 do. of Quinces—10 do. of Figs—16 do. of Currants—15 do. of Raspberries—47 do. of Gooseberries—20 do. of Strawberries—227 do. of Grapes—600 do. of Ornamental Trees, &c. Above 500 of the above kinds of Fruit are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inclosed with bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warehouse, 52 North Market-street, gratis; and orders sent there, or sent by mail, will be most promptly attended.

March 14

Gunpowder, &c.

Do. Pont's Gun Powder, a 25 to 50 cts per pound—Shot—Balls—Flints and Perussion Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 63 Broad-street—By E. COPPLAND, Jr.

For No Du Pont Powder is warranted genuine, unless marked "E. Coppland, Jr. Boston." Sold as above.

March 11

Turkey Rhubarb.

For sale at the Seed Establishment, No. 52 North Market-St. a few Roots of Rheum Palmatum, or True Turkey Rhubarb; being the medicinal sort. Raised by John Prince, Esq. of Roxbury. Price, \$1 per root.

March 14

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long Island, near New York.

IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who may be desirous of stocking their gardens and fields with Fruit Trees of the finest sorts, and most healthy and vigorous stocks the present season.

Bloodgood & Co. attend personally to the Inoculating and Engrafting of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove genuine. The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,

FLOWERING SHRUBS,

AND

PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—Bills may be paid to him.

The reputation of this Nursery is so extensively known, and has been so well sustained, that I take leave to refer this to my want of Trees, to any of the Horticulturists in this City and its vicinity; and if out-of-door demonstration is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Dorchester, procured from this Nursery for three last years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis, on application to ZEB. COOK, Jr. Rogers' Buildings—Congress St.

Barley.

For sale at the Seed Establishment connected with the New England Farmer office, No. 52 North Market street, Boston, a few bushels of plump Seed Barley, raised in Lexington, Ms.

TO PRINTERS. The Establishment of the "Old Hampshire Post" is offered for sale. The office consists of an Imperial Wells' Lever-press, large founts of Double Pica, Pica, Long Primer and Brevier, with a full complement of Job and Ornamental Type. The Paper has at present about 700 subscribers, and a fair proportion of advertising patronage, job work, &c. Northampton is one of the most populous towns in the valley of the Connecticut, with prospects, arising from the plans of internal improvement now in progress or contemplation in the vicinity, of indefinite increase in population and business. There is another paper published in the town, which has a subscription list of nearly 2000. A printer or editor, with a small capital, would find this an advantageous location for a well conducted paper, devoted to politics and general intelligence. The establishment will be sold on liberal terms, and transfer made by the 1st of May. The editors of the Boston Courier, Christian Register, New England Farmer, Worcester Spy, and Connecticut Mirror are requested to publish the above.

Northampton, March 4, 1825.

New Zealand Spinach

Just received for sale, at the Seed Establishment, New England Farmer office, a small quantity of the New Zealand Spinach, the first ever introduced into New England; a particular account of this vegetable will be found in the New England Farmer, page 116 of the current volume, by a number of our New York Horticultural Society. Likewise, English Turnep Seed, for early greens.

COMPLETE GRAZIER.

For sale at the Seed Establishment, connected with the New England Farmer, one copy of the Complete Graziery, or Farmer's and Cattle Breeder and Dealer's Assistant. Comprising Instruction on the Breeding, Feeding, Rearing, and Pasturing of Cattle. Directions for the Choice of the best Breeds of Live Stock. The Treatment of their Diseases, and the Management of Cows and Pigs, during the critical time of Calving and Younging. The general Economy of a Grass Farm. Irrigation and watering of meadows. Culture of the best manure and artificial grasses, and plants for fodder. Various methods of cutting, carrying, and preserving hay and straw in winter, and of the dairy, including the making, curing, and preserving of butter and cheese &c. Together with an introductory view of the different breeds of Neat Cattle, Sheep, Horses, and Swine. Also an Appendix on the Shepherd's Dog, Horses, Asses, Mules, Rabbits, Bees, Farm Accounts, and on the Improvement of British Wool. By a Lincolnshire Grazer. 4th Edition.

Lanreth's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquisitions of useful & ornamental vegetable productions. The collection now on hand is now increased by an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green House Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the most eminent varieties which have originated in this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently rest the rest to the Proprietors, without a fear of disappointment.

The Ornamental departments, such as native and exotic Plants—that contains a splendid collection of Green House Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting-rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Escaent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seedling—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance, undoubtedly conspires in an eminent degree, to obviate the errors and imperfections, so unfortunately in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Colman, No. 31 Congress-St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering may be assured of having every article well and safely packed and forwarded.

Feb. 15.

D. & C. LANRETH

PRICES OF COUNTRY PRODUCE.

Table with columns 'FROM' and 'TO'. Rows include: APPLES, best; ASHES, port 1st sort; BEANS, white; BEEF, mess; BUTTER, inspect; CHEESE, new milk; FLAX; FLOUR, Baltimore; GRAIN, Rye; HOGS LARD; LIME; PLASTER PARIS; PORK, navy; SEEDS, Clover; Wool, Merino, full blood, washed; do do unwashed; do 3-4 washed; do 1-2 & 3 do; Native; Pulled, Lamb's, 1st sort; do 2d sort; do Spinning, 1st sort.

PROVISION MARKET.

Table with columns 'PRICE' and 'QUALITY'. Rows include: BEEF, best pieces; PORK, fresh, best pieces; VEAL; MUTTON; POULTRY; BUTTER, keg & tub; Lard; EGGS; MEAL, Rye, retail; Indian; POTATOES; CEDAR (according to quality).

MISCELLANIES.

THE WEATHER.

The season, 'tis granted, is not very gay, But we cannot, in justice, complain of the weather; For if changes delight us, we have in one day, Spring, summer, and autumn, and winter together.

A Captain's wit.—Frederick the Great, at a grand review at Berlin, observing one of his soldiers whom he knew to be a brave man, but who, [as Cowslip says in the Agreeable Surprise,] would go to any lengths for beer or ale, to be very much out and slashe! in different parts of his body: "I say," asked the king, "at what tavern did you get those beautiful marks?"—"At the sign of the Prague, where your majesty paid the reckoning," answered the man. [It was at this city that Frederick was so signally defeated by Marshal Laudon]. "Bravo! captain," replied the king, whose humor led him to approve of these sallies;—"bravo, captain." And he did not use the term idly, for a commission was prepared in compliment, at once to the service and wit of his interlocutor.

The greater part of those whom the kindness of fortune has left to their own discretion, and whom want does not keep chained to the counter or the plough, play throughout life with the shadow of business, and know not at last what they have been doing.

The character of covetousness is what a man generally acquires more through niggardness or ill grace, in little and inconsiderable things, than in expenses of any consequence, a very few dollars a year would ease that man of the scandal of avarice.

To the honor of virtue be it said, that a man's greatest misfortunes are generally occasioned by his crimes.

Resolution to abilities is what the powder is to the shot. The shot does the execution—but the powder gives the impetus.

Inquisitive people are the funnels of conversation—they do not take in any thing for their own use, but merely to pass it to another.

The mistakes of a layman are like the errors of a pocket watch, which affect only an individual; but when a clergyman errs, it is like the town clock going wrong—it misleads a multitude.

An ancient writer, speaking of such as are enemies to innocent amusements, says, "had these people the government of the world, they would deprive the year of spring, and life of youth."

On the 26th of November last, at Rouen, [in France] a married couple celebrated the completion of the fiftieth year of their union, by a new wedding, as is customary there in such instances of conjugal longevity. The same priest that read the marriage ceremony on the first occasion, officiated at the second, being ninety-one years of age; and, what is remarkable, six other friends and several domestics, who were present at the original wedding, shared in the festivities of the second; and, the principal fiddler for the dance was the same on both occasions. A French paper of the 3d Dec. gives the names of the parties, and vouches for the truth of it.

Whoever commits a fraud is guilty not only of the particular injury to him whom he deceives, but of the diminution of that confidence which constitutes not only the ease but the existence of society.

MORAL SENTIMENTS.

1 To insinuate a thing prejudicial to another, which we are not willing openly to avow is a kind of mental assassination.

2 He is a brave man who dares to meet himself alone in the open field, to examine his heart, un-influenced by the world.

3 Opinions connected with our hopes of happiness, cannot be too strictly examined.

4 The love of money is an opiate, that often lulls conscience asleep, and binds the judgment in chains.

5 They who are the least apt to offend, are the most ready to forgive.

6 In religious disquisitions, the tongue does not always represent the mind.

7 The judgment clarified by charity, may be compared to the bee—which finds honey where the wasp and the hornet gather poison.

8 Habitual reflection on the uncertainty of time, tends greatly to fortify the mind against the snares both of prosperity and adversity.

9 A man without discretion, is like a ship without a helm.

10 Permanent rest is not expected on the road, but at the end of the journey.

11 He who makes conscience his counsellor, may expect to gain his cause.

12 True generosity remembers benefits received, and forgets those it has conferred.

13 We are to apt to covet what others possess, without considering that we possess what they do not.

14 Some are serious about trifles, and some trifle in serious matters.

15 It is not the possession of wealth that makes a man truly respectable, but the right use of it.

16 If love were never professed but when it is felt, it would be a scarce article.

17 Unassuming modesty and diffidence, engage that respect and attention which is often refused to positive assertion and confidence.

18 The beauty of christianity has been obscured by the frivolous contests and intemperate zeal of its votaries.

19 Those who fancy the book of nature contains all the instruction which is essential to their happiness, should consider what they will do when that book is closed.

Revolutionary relic.—A few weeks since the remains of a rifle were found in the Flatbush woods, about three miles from this village, on a part of the old battle ground of 1776. The rifle had been a very fine one, and the brass work and silver plate and sight were perfect. The plate was made of a coin on which 1446 is to be seen. The letters I. C. J. are rudely cut on it. The wood was entirely gone and the iron much corroded. It was found to be loaded with ball. The rifle is now in possession of William Bigelow of this village.—Brooklyn Star.

The Lon. Med. Society has pronounced the tea raised in Brazils to be equal to the finest hyson.

Government has forbid the licensed traders, with the Indians, delivering them any spirituous liquors in sale or barter.

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed-growers, and to leave the sorts perfectly genuine. The following comprises some of our most prominent sorts.

Table listing various seeds and crops such as Artichoke, Beans, Beets, Borecole, Broccoli, Brussel's Spouts, Cabbage, Cardoon, Carrots, Cauliflower, Celery, Cherrie, Chives, Corn Salad, Cress, Cucumber, and others, with their respective varieties and descriptions.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed they can be furnished, at this Establishment with boxes containing a complete assortment of the seeds used in a kitchen garden. It is a favourable term as they can be purchased in this country nearly done up in small papers, at 6 and 12 cts each—warranted to be of the growth of 1827, and of the purest quality. ORNAMENTAL FLOWER SEEDS will be sold on the same terms, when ordered, as well as PRAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts. The smallest order punctually attended to. LAKEWISE, ESCULENT ROOT and PLANTS, FIELD and GRASS SEEDS, POT and SWEET HERB SEEDS, MEDICINAL HERB SEEDS, BIRD SEEDS, and more than 200 different kinds of ORNAMENTAL FLOWER SEEDS. 200 lbs. Onions, Superior Red, White and Yellow. 250 lbs. Radish, superior quality &c. &c.

FARM WANTED.

Any person having a large and good farm, that is capable and does make, not less than one hundred tons of good hay, with a suitable proportion of tillage and pasture land, and a good supply of wood and orcharding, with good buildings, and a pleasant and healthy situation, as to good neighborhood, (and not exceeding 60 or 70 miles from Boston, would be preferred,) will please direct a letter, giving a very particular description thereof, (postage paid) and the lowest price and terms of payment, to A. Z. Care of Mr. Russell, publisher of the New England Farmer.

Published every Friday, at Three Dollars per annum, payable at the end of the year; but those who pay within sixty days from the time of subscribing, are entitled to a deduction of Fifty Cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORSES.

Str.—In my first communication, for "relaxations of luxury," read "emulations, &c." a very different thing; in the ninth paragraph, as it is printed, for "last observation," read "last observation in the last sentence;" for "different," read "unnatural;" for "carries the bones;"—which are," read "carries of the bones of the foot: which appear to be;" there should have been no dashes; in my second communication, for "a superior bone," read "a superior horse;" for "more than any other horse," read "more than at any other age." I will now make a few remarks upon the treatment of a horse kept for his work.

1. As to whether he should ever be turned out. It was once the received opinion of English sportsmen, that he should be periodically brought back to what some people considered his natural state, turned out to grass, deprived of his corn and his shelter from the weather. Hunters, consequently, excepting those of a few sagacious individuals, were regularly turned to grass to shift for themselves in the summer. This system has been, of late years, attacked by a very powerful and classical writer, who asserts, that as to perform the work of an English hunter, the horse's strength must be vastly increased upon nature by a long uninterrupted course of high keep in the stable, to turn him out, is not only to expose him to ruin from taking cold, but to throw away all his acquired strength. The continued summer rest of a hunter, which a horse not exposed to the same exertions does not require, he says, can be taken in a small inclosure at home, the dampness of the earth can be supplied by standing in wet clay, some hours every day, and the grass, if he must have it, can be put into his crib. The ultra-stabulist has completely triumphed, and convinced the English nation, that where a horse is kept ten months of the year in a heated atmosphere, to sleep upon the damp ground, in a variable climate, the remaining two, can do him no good whatever. In our cities, when a horse gets weak or lame, who is used to a hot, dry stable, perhaps to being clothed, with a plethoric system begging for diseases of the lungs and throat, incalculably less accustomed to the milder air than the generality of men, he is sent into the country to be turned out; particularly in the autumn, when the weather first changes to cold, and he is changing his coat! If any person will go into a large livery stable in Boston in May, before the windows are taken out for the summer, when the doors are opened at daybreak, he will find, that though he cannot remain an instant in it himself, the horses have been quietly sleeping, sometimes two in a stall, their own breath and effluvia chiefly confined to their contracted stalls, their nostrils the farthest possible from the air, that they are most of them in good health, and some in high condition. After the efforts nature must have made to bear this, will she instantly retrace her steps? That she will, is defended and acted upon by persons who think they understand horse-flesh. To such persons,

I would quote, if I had the book, the words of Vegetius, who wrote in the reign of Valentinian, when the whole world was interested in horse flesh, and who calls turning horses out at all seasons a Hunnish practice. He wrote for the climates of Syria and Spain. The benefit to a horse of regular work and nourishing food increases his powers for years in succession. He appears to grow thicker. A particular kind of horse, who, to use such an expression, carries his work in his legs and his carcass, and not in any original goodness of his own, a stage-coach proprietor must frequently notice this fact in; and he is the most valuable horse he can get. I mean a horse, naturally of moderate powers of performance for a single day, but who has a deep carcass, with an insensible foot and consequently has open to him a chance of receiving the highest degree of improvement to be derived from a succession of years of strong food and strong exercise.

2. As to how he should be confined in the stable. The universal practice in Massachusetts, as in most other places, is to tie him in a narrow stall with his fore feet higher than his hind ones. In some stables the declivity is very considerable. It is my opinion, that if there must be a declivity, it should be forwards. A horse worked every day on a fast trot over a hard road, as a coach horse, suffers enough in his fore feet when he is sound. One of the first signs of incipient disease is a them, or rather of the crowded state which precedes disease, is his throwing his weight as much as he can on his hind legs. I am inclined to doubt the fact of his preferring to stand up hill under such circumstances. One reason for such an opinion is the manner in which his weight is thrown on his toes when he stands up hill, even if his heels are raised. Another great disadvantage of his standing so is that he throws the whole weight of his forehead upon the same muscles and tendons he uses most in draught. It is certainly of importance, that if he must have an unnatural strain any where when he is not at work, it should not be where the strain must be where he is. It is a vast comfort to a horse to be kept in a box. He should be able to choose his own position, at least to sleep in, and relieve what muscles he wishes to. In a stall, he must sleep, through life, with his head held in the air, and his legs under his body. His getting cast in a box is not a common occurrence. Ten feet square will do well; if he cannot have a larger one. In a box he is freed from the torment of hearing walking and talking behind him.

3. As to how he should be fed. I have never yet met with a person having the charge of horses, who in my opinion attached sufficient importance to the impropriety of allowing a horse his usual allowance of corn when suffering from cold. Not only is the corn thrown away, but it must always do him some harm, and may do him a great deal. Many horses that suffer from a thickening of the windpipe, a disease for which we have here no name, many that are brokenwinded, many that are rumed in their feet, may have it ascribed to being fed on severe colds. The corn increases the disorder of the system by the difficulty with which it is digested, and when digested, it exag-

gerates what tendency may exist to local inflammation. Oats are the least dangerous corn, they being here so very light. There is another remark, which I would make, which is, that no horse should be fed higher than usual, when forced to any accidental violent exertion. He never ought to be forced to any, which he has not been, in some degree, prepared for; and his ability to make it, should be looked for, from the previous preparation, not from any unusual means of supporting his strength. Oats appear to be the corn best suited to a horse's stomach; but he wants something better than ours for full work. There is to an experienced eye, a particular lightness and hollowness between the hip joint and the stifle joint, in worked horses that get nothing better than oats, which is not to be seen in those that get Indian corn. As I observed in my last communication, there is a great difference, generally, in the constitution of the round-chested, and the deep and narrow horse. The first has a much more comfortable one to deal with; the other is often stronger, faster and better winded; but varies infinitely from day to day; feels the seasons more; is not so good a feeder; nor ought he to be; for his stomach is weaker and more readily oppressed.

4. As to how he should be worked. It is a common practice in Massachusetts to water horses just before they leave their stable. This is ridiculous; but a worse practice is to water them during their stage; which last is universal. They unquestionably may become accustomed to it, as to any thing else; but it injures many of them. If driven on again immediately, and thrown into new perspiration, it may possibly prevent the water from injuring them; but I entirely question the fact of its lessening the fatiguing effects of their work. I know that it is hard to tire a pedestrian that will drink but little; and that if he is to walk all day, every tumbler of water, drunk when hot, takes two or three miles from a pedestrian's day's work. It is also a common practice to drive horses through a stream of water when they are hot, to refresh them. The immediate effect, unquestionably, is to refresh them; but they soon feel an increased stiffness from it. It is the practice of some people to tie them up after they come in, in the strongest draught of air which can be found, in a damp brick yard where the sun never shines (still better), and wash their legs with cold water. This is going for the whole. The universal manner in which coach horses are driven in Massachusetts is reprehensible. They are started off at a pace much faster than they are expected to hold, and continually galloped for short distances, when the pace at which they are expected to perform their stage does not exceed six or seven miles in the hour. I do not believe that occasional galloping relieves the horses in slow coaches, where the hills do not render it necessary. I believe they should always be driven as nearly as possible at the same pace; and it certainly has a much more coachmanlike appearance.

No horse is worth breeding now, that will not be able to trot over a fair road his ten miles in the hour, with ease to himself; and to do this he

must have much and good blood. At some future opportunity I will make a few remarks upon the question of foot lameness. I should be very happy if any one else would give the result of his experience upon it, as there is a vast deal of such information afloat, which the public never gets the good of. I would ask any coach proprietor, most of whom have much experience of this kind forced upon them, if he has observed more horses to be lame in the near foot than the off one. It is my firm belief that there are, and there is a plausible reason for such an opinion. I have subjoined the pedigree of the two most distinguished stallions of the Northern States. I would here remark upon the corrupt use of the word stud. A stud means in English a collection of horses. Stud horse may do well enough; but when the language contains an old established term such as stallion, which perfectly expresses the idea of a horse kept for the purpose of continuing his species, there is no necessity for our manufacturing a new one.

Eclipse, a light chestnut horse, foaled in 1814; bred in Long Island; got by Duroc; dam by Messenger out of the English Potbo's mare.—Duroc, was a Virginian horse, by English Diomed; dam a celebrated Virginian mare, but I do not know the pedigrees of the horses whose names are contained in her pedigree. Messenger was an English horse of the first blood; and proved in the States a most successful stallion. The Potbo's mare's dam was by Gimcrack; but I do not know the rest of her pedigree. Potbo's and Gimcrack are amongst the most celebrated names of English horses.

Henry, a dark chestnut horse, foaled in 1819; bred on the borders of Virginia and North Carolina; got by Sir Archie; dam by English Diomed; his grandam's pedigree is Virginian for several generations, but I know nothing of the horses contained in it but their names. Sir Archie is supposed to have been got by Diomed himself; his dam an English mare, bred by Lord Egremont, got by Rockingham out of a Trentham mare. It is impossible for any English pedigree to be higher than Sir Archie's; and he has consequently proved the most successful stallion ever bred in the States.

FOR THE NEW ENGLAND FARMER.

DESTROYING BUGS IN PLUM TREES.

Take of tobacco juice one gallon, this may be had of the tobacconists, or you may make it by putting some tobacco in warm water, (not boiling, as that will take off a great part of the oil.) Oil of tar, one quart—train oil one quart—soft soap one and a half pounds, and a quarter of a pound of soot. Beat the oils together first, and then the soap and soot, till well united, then pour them all into the tobacco juice, stirring them gently together. When the liquid is cold, it is fit for use. It should be applied with a common paint brush, in the latter end of March or the first of April.

Previous to applying the mixture, I should recommend pruning; and when the trees are very much affected with the above-mentioned disease; heading down at a, b, c, d, e, or f, according to the size of the trees; if any of the others should remain after pruning or heading down, they must be entirely removed from the tree and then apply the composition.

In the month of March, 1825, the plum trees of the late Hon. C. Gore, of Waltham, were affected,

with this disease, and which I treated in the above manner. They were so much affected, that I was obliged to head down two of them during the summer of 1826. These trees have since made very luxuriant wood, and free from any of those bunches they have heretofore been subject to. In the summer and autumn of 1827, I had the pleasure of picking as good a crop of fruit (in quantity) from these trees as I have ever seen; and they promise as well for fruit this spring as last.

R. TOOHEY, Gardener.

Waltham, March 1828.

[From the Domestic Encyclopedia.]

MYRICA—Candle-berry Myrtle.

This is a genus of plants comprehending the following native species:

1. *M. Cerifera*. This grows upon boggy lands in the southern States, rising with many strong shrubby stalks to the height of six or eight feet—the leaves are stiff and spear-shaped, of a yellowish lurid green on their upper surface, but paler underneath; of a grateful odour when bruised.—The catkins come out on different plants from the berries, and are about an inch long, and erect.—

The female flowers come out on the sides of the branches in long bunches, and are succeeded by small roundish berries covered with a mealy substance, and afford a green wax by boiling.

2. *M. Cerifera humilis*, dwarf candle berry myrtle; a variety of the former; bark gray, leaves shorter and broader, and more serrated.

3. *M. Gale*, bog gale; also grows in swamps to the height of two or three feet; leaves lance-shaped, smooth, and a little sawed towards the points. The berries are dry, compressed at the apex, and three lobed. This species grows in N. Jersey, but abounds in the eastern States, and in Nova Scotia, according to Mr. Bartram.

The wax is obtained in S. Carolina and Georgia, by boiling the berries of the *M. cerifera* in water, and skimming it. Mixed with tallow, it forms excellent candles; a soap may be also made from it. The following receipt for the purpose, by Judge Bee, is inserted in a little pamphlet, published in the year 1788, by the Agricultural Society of Charleston, S. C. To three bushels and a half of common wood ashes, was added half a bushel of unslacked lime; these, being well mixed, were put into a sixty gallon cask, which was filled with water. In forty-eight hours, the ley was strong enough to bear an egg; it was then drawn off, and from six to eight gallons of it put into a copper kettle, capable of containing about twenty-five gallons; four pounds of myrtle wax were added, and the kettle kept boiling over a constant steady fire, from nine o'clock in the morning, till three in the afternoon. For the first three or four hours, a supply of strong ley was added, from time to time, until the liquor appeared like soft soap; then weaker ley was poured in occasionally, and the whole frequently well stirred. After six hours boiling, two quarts of common coarse salt were thrown into the kettle, which was left one hour more to simmer over a slow fire. The liquor was then put into two large tubs to cool, where it continued twenty-four hours; and then the soap was taken out, wiped clean, and put to dry. The next day it was weighed, and the produce was forty pounds, and two ounces, of solid soap. The loss of weight by drying is not mentioned; but Mr. Bee was informed by one who made the trial, that at the end of six weeks, it was very trifling.

From Dr. Bostock's experiments on myrtle wax, it appears, that when boiled with liquid caustic potash, the fluid becomes turbid; but, after some time, the greatest part of the wax rises to the surface, nearly without color, in a flocculent form. A small quantity of it only remains dissolved in the potash, and this may be precipitated from it by an acid. That part of the wax which rises to the surface, is converted into a saponaceous matter; it has lost its inflammability and fusibility, and forms an opaque solution with water. From this solution, it is precipitated by an acid in the form of white flakes, which, when collected resemble very nearly the wax before its union with the potash. In the Medical Repository, of New York, it is stated, that Dr. Joseph Browne, of that city, had discovered a cheap and easy process for bleaching myrtle wax, but it has not yet been published.—No doubt, however, the coloring matter may be destroyed by the process for bleaching common bees-wax; or by the vapor of alkalis, which, according to Chaptal, destroys the green color of all vegetable matter.

MACHINE TO BREAK FLAX.

November 25th, 1827.

JOHN H. POWELL,

Corresponding Secretary of the Pennsylvania Agricultural Society.

Well aware, from experience, of the difficulty attendant on the process of preparing flax in the usual way, I was much gratified to find, that, at length, a machine has been invented that appears to obviate all the difficulty. On a recent visit to New York, I stopped at Elizabethtown, New Jersey, where I saw a machine propelled by a small steam engine, at work preparing the raw flax without any rotting or previous process. A French gentleman of the name of Frederick Roumage, engaged the farmers last spring, in that neighborhood to raise flax, for which he promised to pay \$15 per ton, as gathered from the field, after having the seed beat out of it. In consequence of this encouragement, he has now the produce of about 400 acres. So well satisfied is he with the machine, that he does not intend either to show or to patent it. All you see is the rough flax put on an endless canvass cloth—enter one side, and in a short time emerge on the other, with the woody fibre as completely separated from it, as is usually done by the best process of breaking, after the flax has been rotted. The fibre in this state has a yellow coloring matter in it, that in a few days may be so completely washed away, that it becomes as white as paper, and almost as soft as silk, a sample of which I enclose with his printed directions to the farmers for the cultivation of the plant. Should these machines be multiplied to a sufficient extent, there is every reason to hope that flax may come into as general use as cotton is now, as \$15 per ton would make it a productive crop.

REUBEN HAINES.

Mr. Powell, Chairman of the Committee on Agriculture and Manufactures. Read Feb. 13, 1828.

An Act for the promotion of Agriculture and encouragement of Manufactures.

Whereas, the Agricultural interests of this Commonwealth have never been protected by Legislative aid—and whereas, the farmers as well as all our citizens, are made dependant upon foreign supplies for the rough materials, necessary for the manufacture of various articles, now made objects

of indirect bounty by the fostering care of the General Government. And whereas hemp and flax constitute important items of home consumption, and might become the basis of valuable manufactures for foreign trade, giving stimulus to agriculture, affording employment for the capital and labor of our own citizens, thus advancing internal improvement, augmenting the wealth and enlarging the enjoyment of all. Therefore,

Sec. 1. *Be it enacted by the Senate and House of Representatives of the Commonwealth of Pennsylvania, in General Assembly met, and is hereby enacted by the authority of the same.* That the sum of ten thousand dollars is hereby appropriated, to be drawn by the warrant of the governor, in favor of the person, who, on or before the first day of March, A. D. 1835, shall, before commissioners to be appointed for the purpose by him, exhibit and try the most perfect machine or machinery, for dressing and reducing flax or hemp without dew or water rotting, to the state fitted for manufacturing, and who shall satisfy them by such trials as they shall deem proper, that the said machine or machines are fitted to effect the objects aforesaid, and that the expense of constructing, erecting, keeping in repair, and working said machines, shall not be too great for the purposes contemplated by this act, and who shall secure to the citizens of this Commonwealth the right of employing said machine or machines free of any charge whatever.

Sec. 2. *And be it further enacted by the authority aforesaid.* That immediately after the passage of this act, the governor shall appoint three commissioners whose duty it shall be to publish the same, and to give notice of the place where such machine or machines are to be exhibited, and a majority of them, shall examine and try the same, and if, in their opinion, any machine or machines so exhibited, after ample trials in the preparation of at least five tons of flax, neither dew nor water rotted, shall appear to them fitted to effect the objects of this act, they shall certify the facts, together with the name of the inventor or proprietor thereof, accompanied by a conveyance in due form from the said inventor or proprietor, authorizing the citizens of this Commonwealth to erect, use, and employ all such machine or machines and process or processes, necessary for the accomplishment of the intentions of this act, free of all charge whatever; and on the receipt of such certificate and conveyance, the governor shall draw his warrant on the State Treasurer, in favor of such inventor or proprietor for the aforesaid sum of ten thousand dollars.

EXPERIMENTS ON SEA COAL AS A MANURE.

BY THOMAS EWELL.

In the proposals I have issued, for the publication of a new work on chemistry, to be adapted for the use of the public in general, it is stated that I would relate some experiments, instituted to throw light on the art of enriching impoverished lands. The result of several of these has so far exceeded my sanguine expectations, that I hasten to publish them; hoping to turn the attention of farmers to a subject by which their interests may be incalculably promoted.

From a train of reasonings, I was led to believe, that the common sea, pit, or mineral coal, which is so abundant in the United States, when finely pulverized, might prove a useful manure. To as-

ertain the truth of this, I made the following experiment.

In three small pots I put equal quantities of a yellow clay, which had lately been removed from several feet below the surface of the earth. To the first pot, a table spoonful of finely powdered pit coal was added; to the second, the same quantity of powdered charcoal (blacksmith's coal) obtained from the common oak; and the third was left without any addition. The same number of sound grains of corn were planted in each; the same quantity of water was daily added to each; and they were exposed in similar situations to the actions of light. The rapidity of the growth of the corn in the pot with sea-coal, exceeded any thing of the kind I ever witnessed.—Many days did not elapse before this corn was four inches high, while at this time, that with the common charcoal was not two inches high, and that with the clay alone, had only sprouted.

After this experiment was made, I procured several small pots, and in each put the same quantity of clay. To the first, I added a drachm of sea-coal—to the second, a drachm of horse manure—to the third, the same quantity of plaster of Paris; and to the fourth, the same quantity of common ashes. The fifth was left without any addition. To each of these the same number of sound grains of wheat and corn were added. The precautions taken in the first experiment were strictly adhered to in this instance. In a few days my great expectations from the coal pit were somewhat lessened, by perceiving that the wheat in the horse manure was an inch high before that of the other pots appeared; however, it was but a short time; for the wheat in the pot with the sea-coal came up, grew to an equal height in a few days, and in a fortnight, although the weather was cold, exceeded it by two inches. The corn in the pot with coal, maintained a still greater superiority—it appeared more healthy, and was more than twice as large as the largest in the other pots.—Several of my acquaintances were astonished to see this great difference in vegetation, produced in so short a time.

Pit coal must be cheaper than any article used as a manure, since it is found in so many parts of this country. The above experiments unquestionably show, that when powdered, its power, in quickening the vegetation of corn and wheat, is much greater than any manure with which we are acquainted. Our knowledge of the effects of chemical bodies of growing vegetables, is but in its infancy. Probably the discoveries which have been made are not as generally known as they should be. It may be owing to this cause—for example, that an ounce of sulphuric acid is not added to every cart load of manure; which has long since been found, in England, to render it doubly valuable.

I congratulate my fellow citizens on their prospect of renovating their large tracts of impoverished lands. By speedily using the coal in their inexhaustible mines, I hope the fertility of all their farms will soon be restored; and that the laboring poor, among my hospitable countrymen, in future, may not suffer so much as to be dependent for bread.

Asparagus, from the garden of Benjamin Austin, Esq. of Newton, was sold by Mr. Townner, in Faneuil Market, Boston, on Saturday the 8th inst. at \$1.25 per bunch.

From the United States Gazette.

BAG WORMS, &c.

Allow me through the medium of your paper, to call the attention of our citizens thus early in the season, before the leaves put forth and obscure from view, a foe which ought to be immediately removed, with the limb from which they swing, and to which they are so firmly attached, as to materially impede the flow of the sap; they are now in a torpid state, but will, with the return of vegetation, issue forth and destroy the leaves, and neutralize the growth of the trees so desirably situated on our footways for affording shade. The Lindens I believe are those most beset with this kind of worm. I would also suggest a careful examination of the body of the tree by opening the boxes and cutting off all the small limbs and suckers to the height of at least 7 feet from the pavement, as they inflict a serious injury if suffered to remain, by preventing the top of the tree from attaining to such a size as to afford a shade, the object for which they have been planted. Several cases of this kind are within my knowledge. Further, those who have not tried the experiment, are not perhaps aware of the impetus afforded to the growth of young trees, by irrigation, a bucket full of water poured on the roots once in 24 hours, or say 3 or 4 times a week, has a most wonderful effect, care should be taken to apply it after sun down and during the warm dry weather. In putting boxes round trees be careful that the last section be attached with screws (instead of nails) and those to be well greased, that they may be withdrawn with facility when it may be necessary to open the boxes to cut off suckers and limbs which so materially exhaust and impoverish the growth of trees.

Cement for Boilers.—It is stated by a correspondent in the London Mechanics' Magazine, that a cement of lime, (made from oyster shells,) and worked into a paste with the white of an egg, and used upon a cracked boiler ten years ago, which has been in constant use ever since, is now as firm as when first put on. It effectually stops the escape of gas through any aperture, when no other cement could be made to rest. The lime must be fresh and unslacked, and the cement applied as soon as mixed, otherwise it becomes solid. It will resist the united action of fire and water; and even the concentrated acids are stated to have little or no effect on it.—*Pen. Gaz.*

Silk.—One farmer in Connecticut, estimates that when his mulberry trees, 500 in number, shall have come to maturity, that the females of his family will annually make 300 lbs. of Silk.—They made 50 lbs. last year, by about 100,000 worms, without feeling any loss of labour. Silk will be extensively produced in the United States, especially in the South.—*Amer. Farmer.*

Sun Flower.—In Portugal, they eat the young shoots of this plant, seasoned with oil and salt; bread is made of the seeds, and also a sort of groats, that a useful & edible oil may be expressed from them, and that they are good for fattening poultry. The leaves of the plant form an excellent forage, especially for cows and sheep.—The stems will do for props for twining or climbing plants; afterwards they will make good fuel, and their ashes afford potash. In some parts of America they roast the seeds, and use them as coffee.—*Gardener's Magazine.*

SCIENTIFIC AGRICULTURE.

An Address delivered before the Hampshire, Franklin, and Hampshire Agricultural Society; at Northampton, Oct. 21, 1827. By EDWARD FITCHCOCK, Professor of Chemistry and Natural History in Amherst College.

[Continued from page 267.]

Concerning the state of agriculture in Great Britain, previous to the fifteenth century, we know but little. We may conclude, however, that when men begin to write books on any subject, an interest in it is excited in the community; and as early as 1534, Anthony Fitcherbert produced a philosophical and ingenious treatise upon agriculture. But in the succeeding hundred years, nothing appeared on the subject, worthy of notice.—Indeed, though rural economy, sometimes waxing and sometimes waning, was upon the whole slowly progressing, yet no remarkable epoch in its history occurred till near the close of the seventeenth century. In the early ages of Modern Europe, the Feudal system exerted a most unpropitious influence upon agriculture. No military was the spirit of that system, such a servile dependence did it produce on the one hand, and such a haughty aristocracy on the other, that both science and art were withered by its touch; and the system itself has long since been nominally extinct, yet its influence remained for centuries.

But a still more powerful obstruction to the progress of agriculture, was an almost entire ignorance of the scientific principles on which it is founded. Till near the close of the last century, the very sciences from which those principles are derived, can hardly be said to have had an existence. Previous to that period, therefore, treatises upon agriculture were merely a collection of common place maxims, partly true, and partly false, mixed with most extravagant hypotheses and wild and hurtful superstitions. And it is only justice to say, that the Agricultural Chemistry of Sir Humphrey Davy, contains more new and valuable principles to guide the agriculturist in making improvements in husbandry, than all which the experience and science of preceding centuries had developed. And it is to be imputed mainly to the application of these principles, by intelligent men, that agriculture, within the last half century, in Europe, and particularly in Great Britain has made such rapid progress.

I know, indeed, that there is a prejudice existing in some minds, against the application of scientific principles as guides in agricultural experiments. It is thought that they serve rather to bewilder, than direct. But if the agriculturist be not guided by scientific principles, what shall he follow? True, his own experience alone may do much to assist him; and it has accomplished wonders in times past. But will not a correct knowledge of the composition of soils, of the food of plants, and of the mode in which that food is converted into nourishment, will not this knowledge prove an important auxiliary to experience? The experience of one man teaches him it is important he should observe the position of the moon, or whether the day of the week be lucky, or unlucky, when he sows and when he reaps. But science tells him, that these, and a hundred other similar observances, are not only useless, but often defeat his experiments. In every other art we regard the most scientific artisan, as most likely, other things being equal, to make improvements. Why should it be different—it is not different—

in agriculture? In short, physical science is nothing but the result of the most accurate and enlightened experience.

If I mistake not, it is one important object of agricultural societies to give a right direction to the efforts of the experimenter, by furnishing him with correct scientific principles. Permit me, therefore, gentlemen, to spend a few moments in the exhibition of those principles that lie at the foundation of agriculture; and in their application to practical husbandry. In doing this, I shall avoid as much as possible the use of technical phraseology.

There are three sciences, Chemistry, Botany, and Geology, with which the theory of agriculture is most intimately connected. Chemistry teaches us what is the composition of plants, of the soil in which they grow, and of the atmosphere that surrounds them; and of consequence, shows us what is their proper food, and the best manner of applying it. Botany dissects the vegetable kingdom, and discloses those curious vessels by which the food of plants is taken up and converted into the numerous distinct principles and parts which they contain. Geology instructs us in the general nature of the soils in which vegetables flourish, and enables us to predict what varieties of soil will be most favourable to particular plants.

The first point that should engage the attention of the enlightened agriculturist, is to ascertain the nature and situation of those minute vessels by which plants absorb water from the soil and the atmosphere, and by which these principles are modified and circulated to every part of the vegetable, and are converted into the plant itself. So minute are these vessels, that even microscopic observation has not been able to detect all their intricacies. But their general structure and arrangement have been ascertained. And it is found that they bear a most striking analogy to those vessels of animals by which nutriment is conveyed, in ceaseless circulation, to every part of the system. In every plant we find one set of small vessels, running from the roots to the extremities, through which the sap ascends, while in its progress it is undergoing those changes that will fit it for becoming a part of the vegetable.—Those vessels resemble the arteries in the animal system. When the sap is thus conveyed to the leaves and other extremities of the plant, it there comes in contact with the atmosphere, gives off its redundancies, and absorbs water, and perhaps other principles, essential to the health of the plant. The leaves of plants, therefore, perform nearly the same functions as the lungs of animals. A second set of vessels, exterior to the first and mostly confined to the bark, now conveys the food of the plant, thus prepared, to every part that needs nourishment; even to the very roots from which it proceeded. These vessels correspond to the veins. Other vessels are found in plants, corresponding, probably, to those similarly situated in the animal system; yet too complicated for explanation on this occasion. Suffice it to mention, that in the vegetable, as well as animal economy, we find the principle of life—itsself inscrutable—modifying and controlling every operation and keeping the wonderful machinery in ceaseless play.

So much for the botany, or rather anatomy, of the vegetable kingdom. We next enquire what are the simple substances that enter into the com-

position of plants; for until the agriculturist knows this, how shall he ascertain what materials are best adapted to their nourishment? And Chemistry stands ready to answer the enquiry.—Out of the fifty simple substances or elements, known to exist, we find vegetables almost entirely composed of three, viz. charcoal and two gases. A few others are occasionally present, and in some cases seem essential to the constitution of the plant; such as silex, lime, iron, manganese, &c. It is by variously combining these few elements that the numerous proximate principles of vegetables, such as sugar, gum, starch, and the like, are produced; and also the unnumbered forms and properties of the stalk, the bark, the wood, the leaves, the roots, the flowers, and the fruit. A beautiful example of the simplicity of nature!

The next point on which chemistry affords light to the agriculturist, is the composition of the soil and atmosphere in which plants are placed. That they derive their nourishment from the first, if not the second of these sources, is certain. It is necessary, therefore, that in these, should be found all those simple substances that are essential to the constitution of vegetables; and the whole subject of manures consists of little else than an account of the modes in which these principles are supplied. The analysis of the soil will show which, if any, is deficient; and thus point to the best mode of supplying those that are wanting.

In regard to those changes that the sap of plants undergoes before it is converted into the vegetable itself, and its various peculiar principles, upon these changes, although entirely chemical, chemistry sheds but a feeble light. We know that every plant must be a perfect laboratory; for we see the sap, which is nothing more than water, holding a few things in solution, entering the vessels of the vegetable, and having passed through them, we find a most wonderful conversion of this sap into pith, wood, bark, leaves, flowers, fruit, and numerous peculiar and compound products; such as gum, sugar, acid, and the like. Here is proof that the most complicated and delicate chemical processes are continually going on in all living plants; processes that infinitely exceed the skill of the most accomplished chemist; and yet, they are hid, from even microscopic observation, by the minuteness of the vessels and agents concerned. We know only that a certain degree of heat and moisture are requisite, and sometimes light also, to carry forward the operation. In these wonderful transformations, however, there is surely one thing the chemist can learn; and that is, a lesson of humility. While he is able, by putting in requisition all the resources of his art, to produce scarcely one of the simplest vegetable principles, twenty or thirty of these are annually formed in every plant.

By the science of geology we are made acquainted with the nature of the rocks that constitute the great mass of our globe. Now it is a well established fact, that soils are nothing more than rocks worn down or decomposed, and mixed with animal and vegetable matter. Hence, in most cases, the nature of a soil is determined by the nature of the rock beneath it. For instance, the soil along the Connecticut is in many places, of a reddish hue; because that is the colour of the rock beneath it. Not unfrequently, however, the materials that are worn away from one rock, are transported a considerable distance, and mingled

with those from other rocks; and thus a soil is formed extremely compound in its characters.

From this view of the subject it appears that we may expect to find as many different soils as there are different rocks; and even more. All rocks, however, may be arranged into a few classes, and the soils resulting from the rocks of a class, will bear a general resemblance. The oldest and most enduring rocks, such as granite, constitute what is called the primary class; and the soils proceeding from their decomposition, may receive a similar designation. Nearly the whole of New England, except the valley of the Connecticut, is made up of primary rocks; and this same class of rocks extends in a south-westerly direction, gradually decreasing in width, through N. York, Pennsylvania, Virginia, North and South Carolina, and Georgia. All the towns in the old county of Hampshire, not situated in the valley of the Connecticut, are based on rocks of this class; accordingly we find in them all, a general resemblance of soil. The second class of rocks is called secondary; being newer, and generally less hard and enduring. The valley in which we are situated, extending from New Haven to the south line of Vermont, is of this description. Two of the most important members of this class are here abundant: viz. the old red sandstone—whose very name describes it,—and the peculiar rock, generally called *trap rock*, that constitutes the precipitous ridges of Holyoke and Tom. Secondary rocks are of immense extent west of the Hudson and North West of the Alleghanies, extending even to the Rocky Mountains.

The third class of rocks, or rather of soils, is called the tertiary; because they lie above the secondary, and were therefore subsequently formed. This class consists of regular layers, or beds, of sand, clay, and gravel. The extensive sandy plains, on both sides of the Connecticut, principally south of this village, are a good example of this class. Wherever the sand is worn away to a considerable depth, the clay lying underneath is made visible. All that extensive level country south of New York, along the sea coast, widdening as you advance, and embracing a large part of the southern States, consists chiefly of the tertiary class of soils.

The fourth and last class of rocks, or soils, is the alluvial. This consists of all varieties of soil, mingled and spread over low grounds by the agency of water. This is the richest and most productive of all soils; and our own Connecticut and its tributaries, particularly the Deerfield, the Westfield, and the Farmington, exhibit many interesting tracts of this description along their margins. They are scattered, too, all over our country; and the world does not furnish a nobler example than is seen along the Mississippi.

(To be continued.)

From Gleanings in Husbandry.

HOT BEDS.

These are in general use in the northern parts of Europe, without which they could not enjoy so many of the products of warmer climates as they now do, nor could they have tables furnished with the several products of the garden, during the winter and spring months.

Made with tanner's bark. This is preferable to that made with dung for all tender exotic plants or fruits which require an even degree of warmth to be continued for several months. The manner

of making them is as follows: Dig a trench three feet deep if the ground be dry; if wet, not above six inches, and raised in proportion, so as to admit of the tan being laid three feet thick. The length must be proportioned to the frames intended to cover it. The trench should be bricked up round the sides to the height of three feet, and filled with tan, such as the tanners have lately drawn out of their vats. It should first be laid in a heap for a week or ten days, that the moisture may drain out of it, which if detained in, will prevent its fermentation; then put it in the trench and beat it down gently with the spade without treading it, then put on the frame with the glasses, and in a fortnight it will begin to heat, at which time the pots of plants may be put into it.

When made with horse manure it must be fresh from the stable, and both the long and short forked up in a heap for a week or fortnight, turning it over once or twice in that time, when it will be fit to use. Make the bed the size of the frame, and cover it with rich earth, from six to ten inches deep. When the bed is too hot, it may be cooled by making holes in the sides with a stake, which must be closed when the beds are of a proper temperature; if too cold, line the sides with fresh manure. Cucumbers thrive when the heat of the mould is at 56 of the thermometer.

Besides tanner's bark and horse manure, hot beds are made with oak leaves, straw steeped in pond-water two or three days, coal ashes, grass; and also grains of malt after brewing thrown together in a heap and well watered, to make a ferment and heat.

Mushroom beds are made like the ridges of a house, composed of alternate layers of horse manure and earth, covered with litter; in the surface of these beds, when they have acquired a sufficient degree of heat, the seeds are planted.

[From Hints for American Husbandmen.]

On Rape—its cultivation and produce in Seed—Its value as Green Food for Neat Cattle and Sheep.

By JOHN HARE POWELL, Esq.

Powelton, Philadelphia county, 1837.

DEAR SIR,—In accordance with your request, I have prepared a notice on the cultivation, uses, and value of cole or rape.

I am not aware that rape had been cultivated extensively in any part of the United States, until 1824, when Mr. Miller and Mr. Phillips of this county, obtained crops so extraordinary in product and value, as to induce them to recommend it to the notice of their neighbours, by the only sort of evidence, which operative farmers will receive.

I have no knowledge of its cultivation, except from my observations abroad. It is highly valued in many parts of Europe, as well for its product in seeds, as for the large quantity of green food which it affords throughout the greater part of the year.

It may be sown either broadcast, or as turnips, in drills—or, in beds, and be transplanted as other varieties of the Brassica or cabbage genus.—The usual and most successful mode, is to sow from two to three quarts of seeds broadcast in June or July, when intended for green food, but in August or September, when destined to produce seeds in the next year.

The process of transplanting is too expensive

in this country—the necessary hand-hoeing, unless the land has been well prepared by previous cleansing crops, would make rape, in the broadcast system, much more troublesome, than if cultivated in rows, admitting the introduction of a horse-hoe. In favourable seasons I should not hesitate, where land is cheap and labour is dear, to allow it, when intended for green food, to take its chance, without the aid of either hand or horse-hoeing.

It produces in ordinary seasons on rich alluvial, or other deep friable soils, from 40 to seventy bushels of seeds, determined in quantity, very much, by the accuracy of tillage and the condition and nature of the land. Great care and precision are necessary in harvesting the seeds in June or July, of the year succeeding that in which they are sown. When the pods assume a brownish cast, and some of the seeds become black, the crop is reaped with sickles—laid regularly in handfuls or *grips* in rows, where it continues until the straw becomes somewhat white—the seeds of the colour of which we find them in the shops. If they be allowed to become too dry, they fall out on the slightest motion—when carried too green, they are liable to be heated. At the proper time they must be thrashed in the field upon old sails or cloths, to which the crop should be carried upon sledges prepared with cloths, or by similar means. The seeds must be carefully spread in small quantities in granaries or on barn floors, and be occasionally moved.

Sheep and neat cattle are extravagantly fond of it—but of all plants, perhaps it is the most likely to cause them to be blown.

There is much difference of opinion as to its nutritive properties in the green state. I believe, that it quite equals the common cabbage, and very far exceeds turnips of all kinds in the quantity of nutrition it contains—in the value of the oil for various manufacturing purposes, and the excellence of the cake, after it has been expressed, for cattle food and the manure of drill crops, no question can be entertained.

It is not a cert in crop—as it is exposed to all the enemies which attack turnips and cabbages—and is liable to be injured at the season of blossoming by mildew and sometimes by frost.

The Season.—The extraordinary mildness of the present season, is the common topic of conversation. Our gardens and shrubberies have assumed the appearance of spring. The prevalent range of the thermometer has been from 58 to 65, occasionally it reached 70: Green peas, asparagus, tomatoes, with other spring vegetables, have been in our market the whole of the past month. A friend informs us that he saw growing in a gentleman's garden in the city, many *Tobacco* plants, thrifty and in full bloom, which had sprung up since November, from roots of old plants; also Green Corn, fully fit for the table, grown from last year's seed.—*Southern Agriculturist, for February, 1838.*

Among the peculiarities of the season, says the *Macon Telegraph*, of the 31st Dec. may be mentioned the appearance of a load of *water-melons* in our market on Christmas day! They were brought, we understand, from Twiggs county, and sold at a good price. In the garden of Dr. Bird, of this town, *Strawberry vines* have been for some time in blossom.—*ibid.*

Every Family to make their own Sweet Oil.—It is reported a person is going to take out a patent for making a small hand mill, for every person to make their own sweet oil. This may easily be done, by grinding or beating the seeds of white poppies into a paste, then boil it in water, and skim off the oil as it rises: one bushel of seed weighs 50 pounds, and will produce two gallons of oil.—Of the sweet olive oil sold, half of it is oil of poppies. The poppies will grow in any garden; it is the large head white poppy, sold by apothecaries. Large fields are sown with poppies in France and Flanders, for the purpose of expressing oil from their seed, for food. When the seed is taken out, the poppy head is boiled to an extract (see New Dispensatory), which is sold at half a dollar per ounce, and is, in some respects, to be preferred to opium, which now sells very high.—Large profits may be acquired by the cultivation of poppies. Some acres of it are now sown near Cambridge.

[I have used during the summer of 1819 nothing but the oil of the bene seed, procured from South Carolina and Georgia. This oil may be obtained in quantities so large, as to be employed profitably in making soap. For salads, I aver from my own experience, that the bene oil furnished to me by Dr. Mease of Philadelphia, is fully equal to olive oil; and may certainly be afforded at less than a dollar for a gallon. I say the same also of the poppy oil made at the former Moravian settlement at Harmony near Pittsburgh. I have tried a bottle of it, and find it no way inferior to olive oil for any purpose. Half the salad oil used in Paris at this moment, is poppy oil.—*T. C.*—*Domestic Encyclopedia.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 21, 1828.

HOW TO RAISE MELONS.

The following method of raising early melons is given in a "Treatise on Gardening," by J. Armstrong, of Dutchess county, N. Y. Select a spot well defended against the north wind, and open to the sun throughout the day. If such is not to be found in your garden, create a temporary and artificial shelter producing the same effect. At the end of March, form holes two feet in diameter, and distant from each other seven feet and a half. Fill these with horse dung and litter, or a mixture of mould, dung, and sand. At the end of twenty days, cover the holes, which have been thus filled, with hand glasses. When the heat rises to 36 of Reaumur, [113 Fahrenheit] sow the seeds four inches apart; and when the plants have acquired two or three leaves, pinch off the end of the branch or runner. This will produce lateral branches which must again be pinched off, so soon as they respectively attain the length of ten inches.—When the plant has outgrown the glass, the latter becomes useless, and may be removed—but should the weather be wet or chilly, substitute coverings of clean straw for that of glasses, until the young plant becomes strong enough to bear the open air. Two or three melons only, are left to each vine, and under each of these is placed a slate, without which the upper and under sides will not ripen together.

In another passage of the same work, the writer gives the following method of superseding the necessity of pinching off the ends of the branches or

runners of melon vines, namely: "If the branches be vigorous and long, stretch them carefully over a level surface, and bury every fourth or fifth joint. This is best done by means of a wooden crotchet. The object of pinching or shortening the stem, are thus completely fulfilled, without any of the risk attending that operation, and with advantages peculiar to this method, as whenever the plant is buried, new roots are formed for the better nutrition of the stem and the fruit."

Virginia Pumpkin.—A pumpkin of unusual size, grew on the farm of John Reynolds, Esq. a few miles from Clarksbury, Va. last season. It weighed 320 pounds, and measured round the middle 9 feet. All that grew on the same vine weighed 840 lbs.

Welland Canal.—The last Report of the Board of Directors announce the rapid progress of this great public work. It appears that the whole line from the Niagara and Welland rivers will be finished by October next, when the communication between Lakes Erie and Ontario, around the Falls of Niagara, will be completed. The importance of this undertaking will be seen, when it is stated that the canal is of sufficient magnitude to be navigated by vessels of 125 tons burthen, and that produce will soon be sent by the ordinary lake craft, from all the upper lakes to Prescott, 130 miles from Montreal, and to Oswego, 186 miles from Albany. The lockage, or fall from Prescott to tide water, on the St. Lawrence, is only 196 ft. and a canal of only 30 or 40 miles in length is required to connect the Lakes with the Ocean; which, if on the same scale as the Welland, would render the Lake Navigation, to all intents and purposes, a Sea Coast of greater extent than the whole Atlantic Coast of North America. It appears that 50,000,000 is required to complete the canal, and that Mr. Merritt, the Agent of the Company, is on his way to England with an application to the British Government for a loan to this amount; which, there can be no doubt will be obtained.—*N. Y. Albion.*

Tooth Powder.—It may be gratifying to our fair friends as well as those who wish to "stand high in their good graces" on the score of cleanliness, to publish the following receipt for making a cheap and incomparably excellent dentifrice, which not only makes the teeth white, but also gives strength to the gums and an agreeable sweetness to the breath.—It is as follows:—Take half an ounce of Gum Myrrh, one ounce of Chalk, and one ounce of Charcoal. The ingredients must be finely pulverized and sifted through a fine sieve, when it is fit for immediate use.—*Am. Advocate.*

Singular Expedition across the Atlantic.—As a proof of the great celerity with which news is circulated at the present day, we may instance the following:—The American President's Speech, delivered at Washington, left New York in the packet ship *Silas Richards*, on the 11th December, arrived in Liverpool on Monday the 31st, was despatched, by express, to London at three o'clock, where it reached at three o'clock on Tuesday; was printed and published by five o'clock the same evening, in a second edition of the "Sun" Evening Paper, occupying nearly five columns, closely printed, and left London that night by all the mails at eight o'clock, arrived again in Liverpool on Wednesday at seven, copies of which were

next day forwarded to New York, which it would probably reach in about thirty days, thus affording president Adams an opportunity of perusing his own speech in the Sun paper, after having sailed across the Atlantic and back again, a distance of 7000 miles, in about forty-eight days!—*Liverpool Courier.*

RAIL ROADS.

We find in the last New York *Journal of Commerce*, the following remarks on a subject in which, we hope our fellow-citizens are deeply interested:

RAIL ROAD TO THE WEST.

"The plan of a rail road from the city of New York to the waters of Lake Erie, which has been suggested to the public, appears to me worthy of attentive consideration. It is true that the Clinton Canal (I know that I shall be understood, and I wish the name might always be given) has realized the most sanguine expectations of those who planned it. But it is equally true, that it is closed at least four months in the year; and the legislature might as well pass a law that it should not rain, as the one which was lately proposed, declaring that the canal should be closed only from December to March. When it rains, we must even do as they do in Spain—let it rain; and when it freezes, we must let it freeze. Without attempting to resist the ordinances of nature, we must prudently accommodate ourselves to them, and making the best use we can of the canal in the warm season, we must contrive some other mode of transportation for the cold. I say we must; for with all the wonderful advantages of our local situation and acquired facilities, the neighboring states and cities are on the alert to take them away from us. Massachusetts has lost none of her wealth or enterprise. She will soon construct a rail road from Boston to Albany, which will make the transportation of goods much cheaper between those two places, than by the present circuitous route, through New-York city. If it be made only as cheap, it will at once prevent this city from being any longer the entrepot of the trade between Boston and the west, of which 100,000 bbls. of flour annually form one item. Still more, it will unquestionably enable the capitalists of Boston to compete with our merchants for the whole trade of the west. For they will then meet us on equal terms at Albany with foreign goods imported into Boston, and transported on the rail road, and for further transportation the canal is as free to them as to us."

Nothing is more delightful than an evening party in a private German circle. You assemble for this occasion immediately after tea, which is regularly taken at six o'clock. Some refreshments, such as pine-apples, grapes, &c. are handed round. The whist, quadrille, or ombre tables are arranged, and the company sit down to play. During the play, a band performs tunes of Mozart's, Weber's, and Rozini's operas; and if there are daughters in the family, whom their friends are coming to see, a dance is arranged before you are aware.—There is in every house not only the music master, but at least two or three servants who are excellent performers. Their rooms not being carpeted, but *parquetted* and polished with wax, are at any time ready for this occasion. It is in these evening parties that the amiable and fascinating character of the high classes of the Austrian empire shines out in all its charms.—*Austria as it is.*

Cure for sprains or bruises.—Take two ounces of cast-steel soap, half pint alcohol or spirits of wine, mix them together, then add half pint beel gall; put it into a bottle and stop it tight. The older it is the better. Bathe the parts affected with it and you will find immediate relief.

THAMES TUNNEL.

This prodigious undertaking, notwithstanding the serious casualties which have interrupted its progress, is still to be prosecuted with vigour.—Since the irruption of Jan. 12, which was less considerable than the former breach, the cavity has been filled, and the water principally re-drawn from the tunnel. About 700 feet remain to be excavated—rather more than half the whole distance across the river. The company's funds are reduced to £21,000 and contributions are so solicited from the public in further aid of this grand sub-marine tunipike. The younger Mr. Brunel, one of the superintendants, narrowly escaped the fate of the six workmen drowned by the last sudden incursion.—*Eve. Bulletin.*

INDIAN CURE FOR THE EARACHE.

Take a piece of the lean of mutton, about the size of a large walnut; put it into the fire and burn it for some time; till it becomes almost reduced into a cinder; then put it into a piece of clean rag, and squeeze it until some moisture is expressed, which must be dropped into the ear as hot as the patient can bear it.

An apricot tree at the rear of Pine-street, New York, has already shed part of its blossoms, and the fruit has begun to form.

Post Office.—We understand there were upwards of 8,000 letters assorted and mailed at our Post Office yesterday—an instance of despatch seldom equalled. During the two last days, upwards of 11,000 were mailed.—*N. Y. Statesman*

Large Cow.—A cow four years old, of extraordinary size, was slaughtered in Hallowell, Me. a few weeks since. She weighed 900½ pounds, and had 71 pounds of tallow. She was raised by Charles Vaughan, Esq. and was one of a breed imported by him in 1792.

✔ An article from an esteemed friend in Cambridge, on the Cultivation and Forcing of Sea Kail, came too late for this paper.—An article on the Propagation of Salt Water Fish in fresh water, and the progress of the experiments made in Scotland will soon appear.

40,000.

For sale, Forty Thousand graded APPLE TREES, from two to four years from the graft—consisting of forty-three kinds of the most approved and superior Families; including early autumn and winter Apples. Also, other Fruit and Ornamental Trees. Orders may be sent to this place via Post office, directed to FRANCIS WINSHIP.

Brighton, March 21st, 1823.

Garden Seeds.

The subscriber has for sale a very large assortment of fresh and genuine Garden Seeds, from the New England Farmer Seed Establishment, Boston.

Latwaise, a few pounds Lucerne Seed.

Newburyport, March 21. E. STEEDMAN.

Milk Cartriage.

For sale, a new Milk Cartriage—inquire of Walter Frost, No 13 Common street, Boston. March 21

Gunpowder, &c.

On Point's Gun Powder, a 25 to 50 cts per pound—Shot—Balls—Plugs and Percussion Caps.

Also, Alum—Refined Sulphur—Blue Vitriol, &c. constantly for sale at the *Dupont Powder Store*, No. 65 Broad street—By E. COPELAND, Jr.

✔ No Du Pont Powder is warranted genuine, unless marked—*E. Copeland, Jr., Boston.* Sold as above. March 14

Russian Flax Seed.
For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston—a few bushels genuine RUSSIAN FLAX SEED imported direct from Riga, by Charles Thorndike, Esq. of this City. This is the sort of Flax that was introduced a few years since, by Col. Perkins from Russia, and which is now extensively cultivated in Bristol county in this State—and is found far superior to the common Flax.

The following is an extract from Col. Perkins' letter, to the corresponding Secretary of the Massachusetts Agricultural Society, accompanying a sack of the seed.

"When in Ireland last summer, I conversed with some of the vendors of Flax Seed from various parts of that country, and flax preferred the seed from Riga, to that of any other country, after that the seed from Holland, and last of all the seed from the United States; of this, the seed from the State of New York had the preference. Upon inquiry, I found the Dutch seed was preferred, from being more clear of tines than ours, and the increase of seed more attended to in the State of New York, than in Massachusetts. The whole importation into Ireland, was 51,000 casks, of which 51,531 came from the United States—10,323 from Holland, and 200 from Riga. The Riga seed commands in ordinary seasons, 20 to 30s. sterling more than the Dutch seed, and the latter 10 to 15s. more than ours. An experiment had been made of sowing in the autumn, in place of the spring, as had been stated in the State of New York, that in Belfast, (which had been sown in October) four feet and an inch in length. This, I understood, was from Riga seed."

Early Potatos.

A few barrels of superior Early Manly Potatos, have been received. This is the same sort as those sold at this place last year, which gave universal satisfaction, as to uncommon earliness, and good quality.

Also, seeds of the Cuba Tobacco, Yellow Tobacco, Teazel, Leunis, Spring Wheat, Spring Rye, Barley, Rape, Brown Corn, Spring Vetches, Castor Oil Bean, Clover, (various sorts)—Wool, Yellow Locust, White Catalogue, Miller, Burnett, Orchard Grass, Rye Grass, Tall Meadow Oats, Grass, White and Red Clover Mangel Wurtzel, &c.

✔ Just received from Europe, 1000 pounds of fresh Lucerne Seed.

Fruit and Ornamental Trees.

At the KENRICK NURSERIES in Newbury, near Brighton, are the most extensive in New England. Gentlemen in want of Trees, are invited to call and examine for themselves—and make their own selections. The Apple and Peach Trees are extra ordinary for size, variety, and firmness.

Written orders addressed to JOHN or WM. KENRICK, and sent to the Newton Post Office, or left with Joseph Bridge, agent, in Court-street, where Catalogues may be had gratis, will be carefully attended to. Trees will be suitably packed for shipping or land conveyance, and delivered in Boston when desired. Gentlemen living at a distance, however, should have agents at the office to receive and pay for them. Mar. 14

Wanted

A MAN to take charge of a valuable Dairy and Farm, within 12 miles of Boston. To one who can produce valuable recommendations, liberal terms will be offered. Apply at the office of the N. E. Farmer. March 7

Turkey Rhubarb.

For sale at the Seed Establishment, No. 52 North Market St. a few Roots of Rhubarb Palatinata or True Turkey Rhubarb; being the medicinal sort. Raised by John Prince, Esq. of Roxbury. Price, \$1 per root. March 11

Grenwich Garden.

Cornish and Varick-streets, about five minutes walk from St. Thomas Church, Bromfield-square, Boston.

D. KENNEY, Proprietor of this Establishment, gratefully for past favors, and the liberal encouragement he has experienced for a number of years, begs leave to inform his friends and the public, that he has received his substantial importation of Bulbous Flower roots—Garden Seeds—Fruit Trees &c. of every description; all of which are in excellent preservation, and will be sold on the most reasonable terms. The importations are from the first firms in England, France, and Holland, and warranted to be good and genuine, and no doubt will give general satisfaction, to the Agriculturist, Horticulturist, and Florist. A choice collection of Green-house Plants—also, Early Herbaceous Plants in every way which are very rare and scarce. Also, a choice collection of Rose Bushes, many of which, originally raised from seed by him, are now in fruit, and not at any other collection, for which a premium has been awarded by the New York Horticultural Society. Other Shrubs and Trees, in great abundance. The Hyacinths, Narcissus, Crocus, &c. are now in bloom, and will continue in succession the greatest part of the year; and will be well worthy a visit to the Garden and Green House, by any lady or gentleman who are near the city.

✔ Botanic's herbaria—Green Vases, Trees, and Shrubs ground or trained, of the shortest and best, and superior Plants of the first quality. Catalogues may be had at the Garden gratis. Orders from any part of the Union will be strictly attended to. Gentlemen supplied with experienced Gardeners. Likewise, situations got for Gardners of industrious, sober habits, and that perfectly understand their business, none other need apply. New York, March 11.

Bose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 30 hundred best Bose bushes—50 do. Provence or Cadberg—10 do. four seasons—300 do. Damask—30 do. Burgundy—5 do. Austrian—25 do. Marble—100 do. Tuscan—100 do. French—5 very large pots monthly. Roses, sixteen years old, and in bloom, about 7 varieties, double Dahlias—Single do.—2 Laura's—Gemma Indica, or Grape Myrtle, two of which are 29 years old—200 Grape Vines, (White Sweet water)—Snow ball Bushes—White Lilies—Red and White Lilies.

ROSE WATER.

20 Demijons Double and Single distilled Rose Water, made entirely from Downer's Roses. The above Rose Water is constantly kept for sale by Mr. C. Warren's Partner, Col. H. P. Merchant's Row, by Demijon or less quantity. March 11

Isabella Grape.

Vines of the ISABELLA GRAPE may be had, on application, to the Subscriber, in Dorchester, or at his office, 74 Congress Street. ZEB 1 OODS, Jr.

Wanted as above a first rate Gardener, who can produce satisfactory recommendations. March 21

Barley.

For sale at the Seed Establishment, connected with the New England Farmer's office, No. 52 North Market street, London, a few bushels of Seed Barley, raised in Roxbury, Ms.

FARM WANTED.

Any person having a large and good farm, that is capable and does make, not less than one hundred tons of good hay, with a suitable proportion of tillage and pasture land, and a good supply of wood and orcharding, with good buildings, and a pleasant and healthy situation, as to good neighborhood, (and not exceeding 60 or 80 miles from Boston, would be preferred) will please direct a letter, giving a very particular description thereof, (postage paid) and the lowest price and terms of payment, to A. Z. Care of Mr. Russell, publisher of the New England Farmer.

MISCELLANIES.

ON PLANTING A TULIP ROOT.

Here lies a bulb, the child of earth,
Buried alive beneath the clod,
Ere long to spring, by second birth,
A new and nobler work of God.

'Tis said that microscopic power
Might thro' its swaddling folds descry
The infant image of the flower,
Too exquisite to meet the eye.

This, vernal suns and rains will swell
Till from its dark abode it peep,
Like Venus rising from her shell,
Amidst the sprang-tide of the deep

Two shapely leaves will first unfold,
Then, on a smooth elastic stem,
The verdant bud shall turn to gold,
And open in a diadem.

Not one of Flora's brilliant race
A form more perfect can display;
Art could not feign more simple grace,
Nor nature take a true away.

Yet, rich as morn of many a hue,
When flou'ring clouds thro' darkness strike,
The tulip's petals shine in dew,
All beautiful—but none alike.

Kings, on their bridal, might urrobe,
To lay their glories at its foot;
And queens, their sceptre, crown, and globe,
Exchange for blossom, stalk, and root.

Here could I stand and moralize;
Easily, I leave that part to thee,
Be thy next birth in Paradise,
Thy life to come, eternally.

Acquaintance table.—The following clever statistics we find in an old Magazine of many years' antiquity, but the numerical statements apply as well now as then:

Two	{	Glances	} make one	{	Bow.	
		Bows			{	How d'ye do.
		How d'ye do's			{	Conversation.
		Conversations			{	Acquaintance.

Receipt for a root.—Take all the ladies and gentlemen you can collect—put them into a room with a slow fire—stew them well—having ready twelve packs of cards—a piano forte—a handful of prints or drawings, and put them in, from time to time. As the mixture thickens, sweeten with politesse, and season with wit, if you have any, if not, flattery will do, and is very cheap. When all have stewed well for an hour, add some ices, jellies, cakes, lemonade, and wines:—the more of these ingredients you put in, the more substantial will your root be. Fill your room quite full and let the steam run off!

A grammatical pupil.—A country school master in the neighborhood of Cuedny, the other day, after giving one of his pupils a sound drubbing for speaking bad grammar, sent him to the other end of the room to inform another boy that he wished to speak to him, and at the same time promised to repeat the dose if he spoke to him ungrammatically. The boy being quite satisfied with what he had got, determined to be exact, and thus addressed his fellow pupil: "There is a common substantive of the masculine gender, singular number, nominative case, and in an angry mood, that sits perched upon the eminence at the other end of the room, wishes to articulate a few sentences to you in the present tense."

A landlord threatened a poor Irishman, the other day, to put a distress in his house, if he did not pay his rent. "Put a distress in, is it you mane?" said Pat:—"Och, by St. Anthony's sox, but you'd better take distress out—there's too much in already, by the nithier that bore me!"

Compliment to Boston.—The Southern Review, in an elegant article on classical learning, thus alludes to the literature of the North. "These improvements, with so many more, are beginning to spring off and blossom, with great freshness and luxuriance, about the favored city of Boston, our western Florence, in which industry has been the willing tributary of letters and the arts, and which is, throughout all its institutions, its character, and its pursuits, one great monument of what commerce has done to civilize and adorn life."

The celebrated engineer, J. M. Brunel, superintendent of the Tunnel under the Thames, at London, is a native of the United States, and was the inventor of the block machinery at the dock yards, Portsmouth.

Large Fruit.—The editor of the Detroit Gazette in speaking of the fertility of that territory says, that during the last month, he has seen several water-melons, each of which weighed up wards of forty pounds—and that it is not extraordinary to see a beet which will weigh more than eighteen pounds. The following are given as the weight and dimensions of a pear picked in a garden at Detroit. Weight 30 ounces; longitudinal circumference 17½ inches; longitudinal diameter 7½ inches; circumference 14½ inches.

TO MAKE A MARROW PUDDING.

Take a quart of cream and milk, and a quarter of a pound of Naples biscuit, put them on the fire in a stew-pan, and boil them up; take the yolks of eight eggs, the whites of four beat very fine, a little soft sugar, some marrow chopped, a small glass of brandy and sack, a little orange-flower water; mix all well together, and put them on the fire; keep stirring till it is thick, and put it away to get cold; have a dish rimmed with puff paste, put the above in, sprinkle currants that have been well washed in cold water, and rubbed clean in a cloth, marrow cut in slices, and some candied lemon, orange and citron, cut in shreds, and send it to the oven: three quarters of an hour will bake it; send it up hot.

The GINSENG, or *panax quinquefolium*, L. is an exotic plant growing wild in North America.

The dried root of ginseng has a mucilaginous, sweetish taste, similar to that of liquorice, but accompanied with some degree of bitterness, and a slight aromatic warmth, with very little odour.—The Chinese ascribe extraordinary virtues to this plant, and consider it as a sovereign remedy in almost every disease to which they are subject. No proofs, however, of its wonderful efficacy have occurred in Europe.

This well known plant, according to Dr. Mease, is the only native production of the United States, which answers to export in order to procure the luxuries of China. It is not much esteemed in China, unless clarified, except in times of a great scarcity of the plant. The process of clarifying, though hitherto kept a profound secret, consists in the careful application of heat and moisture to the fresh roots, and afterwards dipping them in

hot rice water, or a solution of isinglass in water. It is observed that not more than one root in twelve will clarify. This plant grows abundantly near Philadelphia.

Fruit Trees.

WILLIAM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Flushing, Long Island, has the pleasure of informing the public that his Nursery now contains 172 varieties of the Apple—202 do. of the Pears—76 do. of Cherries—1 do. of Plums—25 do. of Apricots—84 do. of Peaches—23 do. of Nectarines—10 do. of Almonds—14 do. of Mulberries—4 do. of Quinces—19 do. of Currants—15 do. of Raspberries—47 do. of Gooseberries—29 do. of Strawberries—257 do. of Grapes—600 do. of Ornamental Trees, &c. Above 300 of the above kinds of Fruit are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warehouse, 52 North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention.

March 14

JAMES BLOODGOOD & Co's,

Nursery, at Flushing, on Long Island, near New York.

IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who may be desirous of stocking their gardens and fields with Fruit Trees of the finest sorts, and most healthy and vigorous stocks the present season. Bloodgood & Co. attend personally to the Inoculating and Engrafting of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove genuine. The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,
FLOWERS AND SHRUBS,

PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him.

The reputation of this Nursery is so extensively known, and has been so well sustained, that I take leave to refer those in want of Trees, to any of the Horticulturists in this City, and in every part of our country, if of equal demonstration is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

My Catalogues will be delivered gratis, on application to ZELB, COOK, Jr., Rogers' Buildings—Congress St.

Lundreth's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquisition of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making a selection, and the fruit is offered as of a genuine nature, but these most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, all of which are calculated for adorning in the water-scapes, parterres, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and aquatics are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Esculent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the highest degree. The preparation of those kinds liable to mix in seedling—in short, the whole process of cultivation, in gathering &c. all being under their own personal superintendance undoubtedly conspires in an eminent degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 31 Congress St., Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15.

AGRICULTURE.

[From the London Quarterly Journal.]
EXTRACTED FOR THE NEW ENGLAND FARMER.
CULTIVATION OF SEA-KALE.

The *Crambe maritima*, or Sea-kale, is an indigenous plant of this and other countries of Europe, and found on the sandy beach of the sea coast. It has long been introduced into our gardens, as a culinary vegetable, but it is only within the last thirty years, that it has been brought into general use, and subjected to a mode of cultivation, very different from that which was first bestowed upon it. The principal value of this plant, is its property of early growth; appearing at the table at a time when few such things can be had. It precedes asparagus, for which it is no bad substitute; and, as it makes a dish of itself, it gives a variety to the delicacies of the table; and if the opinions given of its medicinal virtues be correct, it is well worth cultivation; and the notice we are about to take of it, is describing an easy method of having it in great perfection throughout the winter months, and up to the time it may be gathered from the natural ground.

Prepare one or more beds [with alleys two feet wide between] for the reception of the seeds, in the following manner:—mark out the bed or beds two and a half feet wide, and of any required length, as near as can be from east to west; line off the sides and ends, driving a stake at each corner to ascertain the boundary; dig out the earth of the bed one spade deep, removing it to some distance; fill this excavation with the purest and finest sand which can be procured in the neighborhood, either from the sea shore, the bed of a river, or from a pit. It signifies nothing of what color it is, so it be pure, and as free from loam as it can be had; for in proportion as the soil of the bed is poor or rich, so will the flavor of the plant be when dressed. When this precaution is not taken, and when the plants are suffered to enjoy the rich and cultivated soil of a kitchen garden, or the situation made so, by rich dressings or coverings of fresh manure, the plants are stimulated into an unnatural luxuriance, which deteriorates the flavor, imparting to them that strong disagreeable scent and taste, resembling common cabbage, than which nothing can be a greater drawback on the value of the vegetable; but when grown entirely in pure sand, the flavor is mild and pleasant, and is relished by most palates.

When the bed is filled with sand, and raised therewith about six inches above the level of the ground, [and this should be done previous to the end of March, which is the sowing season,] draw a drill along the middle, from end to end, about three inches deep, in which drop the seeds pretty thickly, as they can be thinned out to the proper distance after they come up. If the sand or weather be dry at the time of sowing, give a little water in the drill and immediately cover up. If the seed be good, the plants will soon appear, and when they are advanced to a size large enough to enable the gardener to choose the most promising, let them be thinned out to the distance of six or seven inches, the distance at which they may

remain. During the summer the bed should be occasionally watered with *dung water*; and this, for the purpose of encouraging the growth of the plants on their first setting off; and as manure given in this shape is more fugitive than when applied in a more solid or concentrated form, it cannot impart rankness to the plants when they arrive at that age fit to be brought to the table. The plants cannot be forced, nor should any of their shoots be cut the first winter after sowing; but should be suffered and assisted to establish themselves, and gain sufficient strength to yield adequate crops the succeeding years.

About the month of November, in the second winter after sowing, a part of one end of the bed should be prepared for forcing. For this purpose, and in order that it should be done with facility and effect, a rough wooden frame should be made eighteen inches high behind, and one foot high in front, shaped like a common hot bed frame, and of any convenient and portable length; and in width the same as the bed. Wooden covers should be fixed with hinges to the back; these may be raised at any time, for the admission of light and air, and in fine weather may be thrown entirely back. When the frames are placed, dig out the alleys one foot deep to receive linings of dung, which may be banked up against the back and front of the frame. The surface of the bed within the frame must be covered with soft straw, or hay, nine inches thick, to arrest the heat which rises from the linings, and form that warm humid region into which the shoots will advance. The temperature of these dark frames must be regulated by due attendance. In very cold, or frosty weather, the frames at night will require a covering of mats or litter.

The required supply of the family—the time for it, and the length and number of the frames, must be judged of by the gardener, and who will act accordingly; but two frames are indispensable; because the second should be considerably advanced by the time the crop in the first is all out. Young plants may be transplanted; and if they are to be had, they may be tried; but the safer way is to sow and plant both, to prevent disappointment; and in order that the roots be not too much exhausted by forcing, one bed should be forced in one year, and another the next.

The crowns of the roots have a tendency to rise—and as annual additions of sand will be required after the autumnal dressing, the beds by these additions become unsightly; but cutting off the most aspiring, with its flowering stem, every summer, will keep the whole within bounds. In stead of covering with dung or litter, to protect from winter frosts, the frames may be set on those parts intended to be forced, to answer that purpose. The uncovered parts of the beds may receive a coat of mould out of the alleys, to be taken off the sand in the spring.

The writer of this article, began to force sea-kale as long ago as 1798, using hot dung within as well as without, a frame with glazed lights;—but soon found, that neither the glass nor dung *inside* was necessary or suitable. He afterwards succeeded by the above plan, to produce the finest crops of this vegetable, at any time in the winter,

and can confidently recommend such management, especially to those who have no hot house or hot bed frames; because, when there is an early forcing house, or frames, if old roots are properly selected and potted in the autumn, and placed in such houses or frames, where there is sufficient heat, and well shut up from light by putting empty pots over them, a crop may be had in this way, without the trouble and expense of out-door forcing.

FOR THE NEW ENGLAND FARMER.

HORSES.

SIR,—In my first communication, for "are noble animals,—and" read "are noble animals; and;" a colon with no dash. The printer's accidentally cutting up an integral paragraph into three, has in some degree affected the sense of a large part of that communication: in my remarks upon the peculiar advantages and disadvantages of the thorough-bred horse, I did not intend to be understood that he never stumbled but in one way, or that he was liable to become unsound no where but in his foot; but that he was more apt than other horses to fall in a manner which I there described, more apt to catch behind, and rather more subject than other horses to foot-lameness: which last fact I ascribe to the peculiar manner in which this English variety of the Arabian, has for a succession of generations been treated. However, for coach work, which is so much on the increase in Massachusetts, we should have horses capable of violent occasional exertion, and to breed them, let a man try what he pleases, he will always eventually look to blood. A single careless incroachment upon his powers, the coarse horse is somehow or other, ever afterwards the weaker for. My observation that the true Cleveland Bay is confined to the County of York, is not entirely correct, he having been always to be found in the bordering County of Durham. It is going rather too far, to assert that all a horse's diseases not arising from contagion, assume an inflammatory form, but it is very near the truth. I will now make a few remarks upon the question of foot-lameness.

The chronic lameness in one or both of their fore feet, and which never occurs in their hind ones, from which the superior orders of horses suffer more pain than from all other diseases put together, has given great occasion to inquiries and theories. It is rather remarkable, that most of the methods of accounting for it, have till of late years gone upon the ground of the deviation from nature of the form of hoof, which universally takes place, in some degree or other, when the horse is shod, and kept in the stable; and none of them upon that of the joints within the hoof being injured by the concussion and strains, to which they are exposed in fast work; and the disposition of all inflammation near a joint to be transferred to it. The sporting and the veterinary world both decided, that it usually proceeded from something wrong about the hoof, with which the internal foot had no part of it originally any concern. They now go the other way, and assert that contraction of the hoof is generally consequent to internal disease. Foot-lameness should be a subject of some interest to the public, for it dooms a very large

proportion of our best horses to a life of comparative uselessness, and of excruciating misery.

1. They had a vague idea that it was connected with the horse's standing on litter in the stable. If this generally produced any real evil to the horse, it would be from the unnatural heat in the foot, and the dryness and consequent contraction of the horn occasioned by the absence of the dampness of the earth, the heat of the litter, and the increased heat of the foot within. The greatest objection to this explanation is that the contraction itself appears to be but slightly connected with the above causes, for the horse's hoofs, if he is kept shod, will contract nearly, or quite as fast, at grass as in the stable.

2. They then maintained that it probably arose from the frog's not receiving pressure, and that the very object of the frog was to prevent contraction by mechanical force. They shod the horse with a shoe lower at the heel than the toe, and with artificial frogs; broke down multitudes; found the hoof contract as much as before; and have at last, I believe, discarded the practice without reservation.

3. A distinguished master of the subject then ascribed it, and with vastly more appearance of reason, to shoeing the horse at all. It certainly would appear to be a tremendous trial of Nature's ability to accommodate herself to circumstances, to nail in iron rings round a living and elastic organ; and one, which as the wall of the hoof grows at the coronet, and is intended to be proportionably worn off by the earth, must be continually attempting to increase in size. Horses were never shod by the Greeks and Romans, with any thing but leather, or with shoes, which were tied on merely when the horse was at work; and nailing on shoes is still totally unknown in most parts of the world. The contraction arising from this fixed ring, tho' it may not ever be the immediately exciting cause of lameness, from the internal foot's in some degree adapting itself to its diminished area, I myself believe to be a great predisposer to it. That it cannot be the common cause, is evident from the fact that horses are never lame in their hind feet, be they ever so much contracted, and that the lameness itself is as often to be found in hoofs that are not perceptibly contracted at all, as in hoofs excessively contracted: which last fact I will demonstrate to any sceptical person, by examining the horses running in the coaches of any road in Massachusetts. I wonder that the very able defender of the theory of foot-lameness's arising from the modern system of shoeing, instead of explaining it by the crowding of the sensible foot, did not perceive that its far most dangerous action was, from the contracted area of the back part of the foot, and the increased concavity of the sole's interfering with the action of the very joint, the injury of which is now considered the most frequent cause of this dreadful disease.

4. They were finally compelled to own that contraction could not be the common cause; (so many horses being struck with it, who had been never shod before, upon their being first put to work, might have been conclusive evidence to the contrary,) and have now generally supposed it to be a disease, which may afflict a horse that is kept standing upon the earth all his life, and who is never shod, provided he is exposed to sprains and concussion. At the back of the coffin-bone, there's a small bone, placed horizontally across the foot, excepting that it is in the form of a crescent, ex-

actly resembling a very small shuttle. It is called the shuttle-bone, or from its resemblance to the shape of a boat, the navicular-bone. The outer side of the crescent lies backwards and downwards, and has a ridge in the centre of its surface. It is articulated both with coronet-bone and with the coffin bone. Its especial office is to form an additional pulley for the back-sinew; which passes over its convex side, and is kept in its proper place upon it, by a groove corresponding to the ridge upon the bone. A bursa mucosa, or sac containing and secreting the sinovia or joint-oil, is interposed between the back-sinew and the bone; no way differing, I take it, in office or liability to disease from the bursa mucosa in other parts of the horse's frame. All the weight which the horse throws upon the leg is of course received by the coronet-bone, which, being articulated with the coffin-bone, which when the hoof is placed upon the ground can have no motion but that allowed by the cartilages and the laminae at its sides, sinks backwards and downwards, from its joint with the pecten bone, directly upon the navicular bone.—The navicular bone being articulated with the coffin-bone, which is nearly motionless, receives what weight is not thrown upon the coffin-bone, and rolls backwards and downwards also upon the back sinew. The back sinew being fast immediately almost below, and being perfectly inelastic, the navicular bone cannot roll upon it, the joint, if it may be called so, is destroyed. The weight is now transferred to the back-sinew, and is partly received by the muscles into which it is inserted above, and they share it with the elastic internal frog below the back-sinew, and the back part of the foot generally; all of which, if the horse has never been shod, is highly elastic. As this joint is the most perpendicularly opposed to the resistance of the earth of any joint in the horse's frame, and as all the elasticity of the back part of the foot, which Nature calculates upon, is neutralized by the iron, and in fact its area much diminished in general, disease of it would really seem to be very often expected in a shod horse, exposed to the concussion of fast work upon a hard road.—That it seldom or never occurs in the hind feet is natural, when we consider that the weight thrown upon them is comparatively trifling, and that the resistance of the earth is not opposed to it perpendicularly, but in a very oblique direction.—That foot-lameness generally arises immediately from concussion, is almost proved from its never occurring in the hind feet, which are also exposed to strains; and that it generally arises from disease of this joint is supported by the fact of this joint's being most exposed of any in the foot to concussion in the fore feet.

This joint, therefore, appears to be very much exposed to inflammation from direct injury, or if predisposed to it, it may appropriate to itself any general inflammation of the foot, from whatever cause. The first step of the disease is in the bursa mucosa, or sac, between the bone and the back-sinew; the second is a destruction of the smooth surface, and a caries of the bone; a consequent impediment to the roll of the bone upon the back-sinew; and in extreme cases, I take it, an ossified union of them together. There can be no doubt that in every step of the disease, the least motion of the foot, but particularly work upon the road, must occasion the horse a great degree of pain.—As this chronic lameness in their fore feet is almost unknown in some breeds and in some fami-

lies of horses, and is distressingly common in others, and as we well know, that in mankind, not only are hereditary taints very apt to show themselves in the joints generally, but we have almost as an established fact that the generally curious teeth of civilized nations is in fact to be ascribed to a superinduced frequency in their ancestors, I must continue to believe that this disease, or a strong predisposition to it, is very often hereditary.

The only approach to a relief of this disease, that has yet been discovered, is the operation of neurotomy; or completely destroying all nervous communication between the foot and the brain. This entirely, of course, destroys the sensation of the foot; and enables the horse to go with considerable freedom till the nerves reunite; but it can have no effect upon the disease, but to facilitate its progress by making the horse use his foot more roughly than he would otherwise have done, and I cannot conceive how it is possible that any cure ever should be discovered for it, after it has passed the first stage and affected the surface of the bone. However, I should like to see the opinions of gentlemen of infinitely longer experience in horse flesh and more intimate acquaintance with the principles of anatomy and the resources of the surgical art. Yours, &c.

JOHN LANGDON ELWYN

FOR THE NEW ENGLAND FARMER.

DISEASE IN HORSES.

Kennebunkport, March 11, 1828.

MR. FESSENDEN,—Will you or some other gentleman, inform me (through your paper) which is the best method to be pursued, as the best mode of treatment for a horse that is severely purged. A neighbor of mine has had a very valuable horse sick with this disease for about six weeks—falls away very fast, and is afraid of losing him, unless some remedy can be applied to relieve him. The day previous to his being taken, he was fed with corn, and rode about twenty miles. When he is kept still in the stable for one or two days, he becomes apparently well; but as soon as he is rode, the complaint returns. An immediate attention to the above, will confer a favor.

Respectfully yours,

J. N. LANGDON.

FOR THE NEW ENGLAND FARMER.

GRAFTING.

Hampden, March 11, 1828.

MR FESSENDEN,—I send you several samples of grafting by a process which I have not seen described, and therefore suppose may, possibly, be new to you.

I have had my grafting done in this way, for the last two years, by Mr. William T. Pull from England, and am fully convinced of its superiority over all other methods I have ever seen. The stocks are not exposed to the admission of water to the pith, as in cleft grafting. The scion cannot be easily displaced, and is in no danger of being broken off by violent winds. The scion and stock come in contact at four distinct points, and the chances of success are increased almost to certainty. The healing process commences immediately, and in nursery grafting, is entirely perfected in about six weeks.

The only points which occur to me as requiring particular attention are: that if in raising the

bark of the stock, a little wood should be taken up with the knife, it should be removed. The cleft in the scion should terminate immediately below a bud, for two reasons; the scion will be less disposed to split further, and, should it be broken off above the bandage, this bud will shoot and save the grafts. The bandage should be removed in about four weeks, or, as soon as the young shoots have extended to the length of three or four inches. Should this be neglected, the stricture will impede the circulation and eventually destroy the tree. I give you a small sample of the last spring's grafting, from which the ligature was not removed. It exhibits the healing process; and also, the consequences of neglecting to remove the bandage. Yours, &c.

J. HERRICK.

By the Editor. The kind of grafting mentioned above appears to be a species of what is called *Saddle Grafting*. The head of the stock is cut off obliquely by a stroke of the knife, the incision commencing on one side and ending on the other side, which forms the point of a wedge. The scion is then split, or divided in the middle, longitudinally, about two inches from its lower end, and each half thinned and tapered to a tongue shape. The scion is then placed on the stock, its split sides embracing the wedge, and their lower ends introduced between the bark and the wood of the stock. The samples, mentioned by Mr. Herrick may be seen at the N. E. Farmer Office, and will give a better idea and plainer exemplification of this mode of grafting than can be communicated by words.

Extracts from "Prince on Horticulture."

PEARS.

Early Green Chisel.—This is a green pear of middle size, very full of juice, and the finest flavoured pear of its season; it ripens about the end of July.

Jargonelle.—This is a fine fruit, ripening shortly after the preceding; it is of a green colour, with a little russet on the side next the sun, and has a long neck; it bears remarkably well, and is sent in large quantities to the New-York market. In France it is called *Cuisse Madame*.

Autumn Burgamot.—This pear is rather of a small size, but is one of the finest flavoured melting pears; it is in perfection in October.

Crasanne Bergamot.—This is an extremely fine fruit; the flesh is very tender, and full of delicious juice; it is one of the finest pears in eating from November to January.

Seckel.—This incomparable little pear, which is now becoming so widely disseminated in our country and abroad, originated on the farm of Mr. Seckel, about four miles from Philadelphia. It is at least equal to any European pear I have met with, and is by far the highest flavoured pear that has originated in this country. The fruit is of a russet colour, with a red cheek next the sun, and grows in clusters of from two to seven in each.—I have noticed, that much of its fine spicy flavour is contained in the skin, and in eating it this should not be taken off. It grows more slowly than any pear tree I am acquainted with—and, in fact, at maturity, forms a tree of only moderate size, but peculiarly compact and regular in its form. Although this pear has been figured in the Transactions of the Horticultural Society of London, and both European and American gentlemen conversant on the subject have stated, that no fruit simi-

lar to it existed in Europe, still there is a pear which has been long cultivated in France and England, and almost every other country in Europe, so extremely similar to it, that I venture to assert, that beyond all doubt, it is the *parent of the Seckel*. The pear to which I refer is the "Roussellet de Rheims, or Petit Roussellet," called also in Europe "*the Musk or Spice Pear*." The growth of the respective trees is similar, and the fruit so much alike, that persons have mistaken them for each other. The difference consists in the part of the fruit next the stem being more pointed in one than the other, and in the spicy flavour of the Seckel being much higher than that of the Roussellet de Rheims. The colour and size are much the same.

Skinless.—A tree of strong growth and very productive; fruit of medium size, pyriform, green and yellow, with some touches of red; melting and high flavoured; ripens in August.

French St. Germain.—This is a fine dark green melting pear, very juicy, and of delicious flavour; but the tree in some parts of the country does not produce well, and the fruit is apt to crack. They should be gathered in October, and laid singly on shelves, where they will continue to ripen in succession during the whole winter.

Prince's St. Germain.—This pear is a seedling of the French St. Germain, impregnated by the St. Michael, and was originated from seed by myself. It is of a larger size than either of its parents, of a yellowish green colour, with a red cheek. Its flavour is similar to that of the French St. Germain, but it has the advantage of always being a perfectly fair fruit, and a great bearer.—They should be gathered in October, and laid separately on shelves, where they will gradually ripen for several months. Next to the Seckel, I consider this as the finest table pear our country has ever yet produced.

Franchepanne.—A pear of medium size, and oblong, of a fine yellow colour; half melting, sweet and sugary—finely flavoured; ripens end of October.

Imperial Oak Leaved.—A spreading tree, with fruit of medium size, resembling the *Virgouleuse*, to which it is rather inferior in quality. The tree is remarkable for its luxuriant foliage, and the fruit matures during the winter months.

Boston Epergne.—This tree bears the characteristics of a native fruit, and without doubt originated in the vicinity of Boston, where it has acquired much celebrity. It bears well when at an age sufficiently mature, and the fruit is about the size and shape of the French St. Germain, and by some considered equal to that and the St. Michael in flavour. It is yellow on one side, and red on the other, and ripens near the same time as the St. Michael. It is frequently called at Boston "*L'Epergne*," and has in consequence been supposed by many to be the French fruit of that name, until I detected the error, and explained it in my last Catalogue.

English Red Cheek.—This pear, cultivated at Rhode-Island under the above name, whence it was brought to Long-Island, is a bell shaped fruit, of a beautiful yellow colour, with a red cheek. It is not quite as large as the St. Michael or *Virgoulieu*, but is considered a very fine fruit, and bears well; it ripens in September.

Rushmore's Bon Chretien.—This is a native pear of very large size, and one of the greatest bearers. The growth of the tree is particularly

strong and rapid, and it soon arrives at mature bearing. When ripe it is a pale yellow, with a red cheek. The fruit is *breaking* when ripened on the tree, but becomes *buttery* when matured in the house. It is considered but a tolerable table fruit but when this is taken in connexion with its being a most excellent pear for cooking, and ripe at a season when few other pears are so, and producing very abundantly, it may be considered as one of the most useful pears in a general view; it ripens in succession, from the end of August to the end of September.

Spanish Bon Chretien.—This is a good winter pear for baking or preserving; it is not so large as the common Pound Pear, but when ripe changes to a yellow, with a red cheek, which gives it a much finer appearance for a market fruit, and it is also more delicate, and possesses less of the roughness and astringency of the former; keeps till April and May.

Pound Pear.—This is one of the largest pears known, and on vigorous trees and good soil, attains to an immense size. They are green, with a red cheek, when one side is exposed to the sun; they are good pears for baking or preserving, and become much better towards spring than when gathered from the tree; keeps till May.

The-kish Bon Chretien, or B. Tare.—This is the most beautiful of all the Bon Chretien pears, and the largest in size. It is also said to be superior to them in flavour, although it partakes of the general characters of that class.

Forty Ounces.—This is said to be the largest fruit of the pear kind known in France and the north of Europe; its principal use is for baking or preserving. A pear was exhibited in this vicinity, during the season of 1826, weighing 40½ oz., which was of the Bon Chretien family.

Red Flowering, or Sanguine d'Italie.—The blossoms of this pear are red, and of singular appearance; the fruit has within the resemblance of the Blood Peach, being marbled with red. It is a baking pear, and esteemed as a curiosity.

Striped Dean.—A long pear, striped lengthwise white and green; it is a pleasant flavoured fruit, and a great curiosity; ripe in September.

Franchal.—A very large flat shaped pear, of a yellowish green colour, suitable for cooking from October to December.

Double Flowering.—This tree, in addition to its flowers forming a great ornament, produces also pears of a large size, proper for cooking; they are yellowish in color, and keep till February.

Bartlett.—This pear weighs about 10 oz. when at full size, shaped like a Bon Chretien, very yellow and slightly tinged with red on one side; quite juicy, and by many considered a first-rate fruit. It is not, however, equal in flavour to the Seckel, or even to the Boston Epergne, but its size and beauty render it greatly admired. It much resembles in flavour and consistence the St. Michael, and is said to command a high price at market. It is no doubt a native, and appears to have originated in the vicinity of Boston; and it does not seem at all strange that many fine new pears should have originated there, as that city and its environs, have for a long period been inhabited by a great many gentlemen extremely intelligent on the subject of Horticulture, who took much pains, at an early date, to introduce the choicest fruits, and particularly the finest varieties of pears, of which fruit they are skillful connoisseurs.

SCIENTIFIC AGRICULTURE.

An Address delivered before the Hampshire, Franklin, and Hampden Agricultural Society; at Northampton, Oct. 24, 1827. By EDWARD HITCHCOCK, Professor of Chemistry and Natural History in Amherst College.

[Continued from page 277.]

From this sketch, Gentlemen, it appears that the region of country embraced by this society, contains almost every variety of rock, and therefore a correspondent variety of soil. And since different vegetables require for their perfect development, different soils; this circumstance must be regarded as highly propitious to the prosecution of experiments. Do you enquire for a soil resulting from the decomposition of granite? You have it in Williamsburgh, in Whately, in Belchertown, in Amherst and Leverett.—Do you need soils derived from the other primary rocks? You have them in nearly all the more elevated parts of the three counties. Do you wish for a soil whose base consists of disintegrated red sandstone? You have it in Gill, in Greenfield, in Deerfield, and in many other places. Does your experiment require what European writers denominate a basaltic soil? The eastern slope of the ridge, constituting Holyoke and Tom, furnishes an example nearly identical with this. Do you wish to compare the produce of land in the vicinity of the coal mines of Europe, with that of our own coal formation? Then you have only to perform your experiment in Granby, or South Hadley, in the eastern part of Longmeadow, or the western part of West Springfield. And as to soils of the tertiary and alluvial classes, you have a wide extent of the former in the plain extending from South Hadley through Springfield to Enfield; and in the plain between Northampton and Southwick: and what finer examples of the alluvial could you wish, than the rich meadows of Northfield, Deerfield, Hatfield, Springfield and Longmeadow?

But more than all this. Not only does the whole extent of these countries present so many varieties of soil, but in some instances a single township contains them nearly all. Northampton, for instance, has its fine alluvion on the east, and on the north and south, its tertiary. On the west we find granite and a granite soil. Along the western foot of Mount Tom, is the old red sandstone, with its peculiar soil: the mountain itself presents the basaltic variety; and along its eastern base, is the soil peculiar to the coal formation. A variety almost equally great, exists in Hatfield, Deerfield, Northfield, Montague, Amherst and Belchertown.

I am aware, indeed, that there is one variety of soil, and that not an unimportant one, which can hardly be said to have an existence along the Connecticut. I refer to what is called calcareous soil; or one proceeding from lime stone. Yet as a sort of substitute for this deficiency, I trust I shall be pardoned for alluding to the recent discovery of a variety of limestone along this river, capable of forming the water proof cement. It is interesting that this should be brought to light, just at the time when it seemed indispensable to the prosecution of a grand work of internal improvement, which, to say the least, will be to the western branch of the valley of the Connecticut, what that noble river is to the eastern. The discovery is interesting too, because, if I mistake not, the variety of limestone here employed, which is the vituminous, has never before been used for this

purpose. And finally, I might remark, that such are the associations of this limestone, that we may expect to find it almost any where along this valley, between New Haven and Vermont.

But to return from this digression. I have now given a general view of those principles of Botany, Chemistry and Geology, that form the groundwork of the theory of agriculture. There are other sciences, however, that have a less intimate, though not unimportant connexion with the subject.

Almost every person, for example, has noticed how very great is the influence exerted over the growth and colour of plants by light. Here then we perceive a relation to the science of optics.

Gravitation also, is not without effect in giving direction to the roots and branches; though some other controlling power—perhaps an instinct—must be called in to explain all the phenomena.

It is well known how the produce of the soil varies with the state of the atmosphere, in respect to its weight, its moisture, its temperature, and purity. Hence we see how important a relation exists between agriculture and meteorology; tho' it must be confessed that this branch of knowledge is yet extremely deficient even in fundamental principles.

The effect of electricity upon vegetation is much more powerful than is generally supposed. Indeed vegetable life itself, may be only a modification of this power; and it is an ingenious suggestion of one of the ablest living philosophers, that those numerous chemical changes which are constantly going on in plants, may be the effect of galvanic or electrical action. But apart from Hypothesis, we have facts proving directly, that electricity acts as a powerful stimulant to vegetation. For grain in low lands, exposed to powerful storms of lightning, is thereby blighted: and in similar circumstances buck wheat fails to be productive.

But to dwell no longer upon the theory of agriculture; permit me, gentlemen, by way of application of that theory to practical husbandry, to make a few suggestions in regard to the mode of conducting agricultural experiments.

The frequent failure, and apparently opposite results of such experiments, are facts not to be denied. Indeed, so frequent have been instances of this kind, that many persons have lost all confidence in experiments, and regard this part of the business of agricultural societies as useless. But if there are any fixed principles on which agricultural processes depend, (and how can this be doubted, when we see the constancy of nature's operations in every thing else,) why ought we not to impute frequent failures in experiments, to the imperfect mode of conducting them; or to presume that the details are not given with sufficient minuteness, to enable us to judge whether they are, or are not, contradictory to others? Those conversant with philosophical and chemical experiments, know very well, that the most trivial and unthought of circumstance often entirely defeats them, or conducts to an unexpected result. Much more then, ought we to expect similar occurrences in agriculture, where the processes are a thousand times more complicated and delicate, and scarcely understood at all. Hence then, it is an important enquiry, what is the best mode of conducting experiments in husbandry.

The first suggestion I would make, is, that such experiments be prosecuted according to the estab-

lished principles of philosophy. I know that many an agriculturist will feel that I am directing him to lean on a broken staff. But by philosophy I do not mean mere airy speculation; but established principles, drawn by induction from the most accurate and long continued experience.—I mean the laws that observation has discovered, by which the operations in the natural world are conducted. And shall the experimenter prefer his own limited and partial experience to the accurate and enlightened observations of the whole world? Or shall he pay a regard to the thousand groundless maxims and whims that are floating among the ignorant, and are alike repugnant to philosophy and common sense? It is to the observance of such unsupported fancies—the relics of superstitious and marvellous times—that we are to impute the failure of many experiments. For even in this enlightened land, many such notions sway the belief and control the practice of multitudes. What a mighty influence, for example, is imputed to the moon, in almost every operation of the farmer!—He cannot sow or reap; he cannot cut down his wood or his timber, or even kill an animal for food, until the moon has reached some particular point of her orbit. And even in the soap making process of the housewife, the moon has a most important part to perform, even if she be in the nadir. Surely, if this harmless planet has so much labor to perform in husbandry, she ought to be released from her cares as ruling among the stars of the evening; and instead of being called queen of the night, her title should be, queen of agriculture!

But to be serious: such notions are the lingering remnants of astrology; ill agreeing with the spirit of this age, and altogether opposed to sound philosophy and good sense. Every enlightened farmer, therefore, will disregard them, and a hundred others of a kindred character; permitting them all to join that chaotic company of phantoms, described by Milton:

"All these, upwhirl'd aloft
Flew o'er the backs, &c. of the world, for ill
Into a limbo, large and wide; since call'd
The Paradise of fools—to few unknown
Long after—"

The second suggestion I have to make, in regard to agricultural experiments, is, that every circumstance which can mediately or immediately affect the result, should be carefully observed and recorded. The remark of a French philosopher, that "real and general advances will then only be made in the science of nature, when the dread of prolixity shall be overcome," may be pertinently applied to agriculture. The most trivial circumstance often reverses the result of an experiment: nor can we tell beforehand, so little do we know how to calculate the complicated operations of the vegetable world, what that circumstance may be; and often it finally eludes our search. Therefore, we must record every thing that can have any bearing upon the result; and thus shall we, in most instances, avoid the difficulty. But if the experimenter, after reasoning upon the subject, concludes this or that circumstance to be too trivial to be noticed, he will not unlikely mislead himself and others in his conclusions. For in subjects of this kind, the philosophy of experience, and the philosophy of reason, are often at variance.

One very important circumstance in all experiments upon the produce of land, is the nature of the soil. Perfect definiteness, however, in the description of soils, is not attainable; because they

pass into one another insensibly. The rules adopted by Sir H. Davy on this subject, will, nevertheless, furnish us with convenient landmarks. "The term sandy soil," says he, "should never be applied to any soil that does not contain at least 7/8 of sand. Sandy soils that effervesce with acids, should be distinguished by the name of calcareous sandy soils, to distinguish them from those that are siliceous. The term clayey soil, should not be applied to any land which contains less than 1-6 of impalpable earthy matter, not considerably effervescing with acids. The word loam should be limited to soils containing at least one-third of impalpable earthy matters, copiously effervescing with acids. A soil to be considered as peaty, ought to contain at least one-half of vegetable matter."

Suppose the experiment relate to the application of manures. To judge of their effect, we should know the nature of the soil; the season of the year in which they were applied; the state of the weather at the time; whether wet or dry; cold, or warm; clear, or cloudy; whether decomposition is just begun, or has proceeded far; whether spread uniformly over the surface, or otherwise: whether ploughed in immediately, or not; and the state of the weather subsequently.

In the paring and burning of lands—processes but seldom attempted among us—the character of the soil is a circumstance of prime importance; whether recently brought under cultivation—whether sandy, clayey, mossy, or peaty; whether naturally wet and cold, or warm and dry; whether drained previously to the operation: the state of the weather at the time, and subsequently, &c. Similar particulars should be noticed in fallowing.

Suppose the process to be transplanting. Most obviously a minute account of the soil whence the plant was taken, and of that into which it is introduced, is requisite. Also the state of the weather; the relative situation of the plant, in regard to the meridian; its subsequent treatment, and the like. In engraving and inoculating, besides the state of the weather, and the mode of performing the operation, we should state the age of the stock, and of the tree from which the scion or bud is taken.

In irrigation, not only the nature of the soil to be watered, and its previous state should be given, but also the character of the water brought over it; whether from a river, or a pond; a lake, or the ocean; and the character of the rocks and soils in their beds.

But not to dwell upon particular cases; I remark that there are certain circumstances of a collateral and more general character, that seem necessary to be made known, to enable us to judge correctly of an agricultural experiment. The most important of these relate to the state of the wind, the weather, and the temperature through the season. So important is the bearing of these circumstances upon the vegetable kingdom, that it is impossible we should rightly estimate the result of an experiment upon the productions of the soil, unless a meteorological journal, more or less perfect, accompany the result. One register of this kind might generally serve for a town; and how great would be the benefits of keeping one in each town, not merely to the interests of agriculture, but also to those of science! And since the state of the weather is a subject so deeply interesting to every class of the community, would

it not be easily practicable, to obtain in every town, the means of observation, and an individual to whom the keeping of the journal would be a pleasure. In the innumerable discussions that take place, every where, concerning the weather, how very satisfactory it must be, to be able to appeal to some fixed standard, by which one day, one week, one month, or one season, might be compared with another. This would be substituting facts for vague conjecture; and would tend, more than almost any thing else, to convince men that neither the moon, nor comets, nor shooting stars, nor eclipses, are the principal causes of change in the weather.

(Concluded next week.)

SWAMP MUCK, SUGAR BEET, &c.

[Extract of a letter from a correspondent in Catskill, N. Y. to the Editor of the New England Farmer.]

Sir,—I was much pleased with the remarks of a brother yankee, at the east, on the subject of swamp muck as a manure, in the 30th No. page 238, of the present volume of the N. E. Farmer. I am inclined to think that the muck he alluded to, is different from the muck in these parts. That which is obtained in swamps here, when removed to upland, becomes dry and crumbles fine. From a small trial of its utility five years since, I have found from that time to this, that its effects were visible in the improvement of grass. The muck was put on the top of a hill, (composed of yellow loam) in the fall previous to sowing a crop of winter rye. The following summer it was evident at a distance where the muck was spread, by the fertility of the crop. This experiment gave entire satisfaction, which led me to feel that my farm had within itself a competency to fertilize every part, when the different parts were applied on each other. The muck, spread on upland, either before a crop of grain or grass in the fall, and the loam, spread on the low land, I have supposed were valuable manures, though capable of much improvement by addition of lime, ashes, or mixing with barn-yard manure. I had intended to have made a more thorough trial of it, but a variety of causes have prevented. This season I intend to make such trials as to be able to give a more full account of it in future.

With regard to the sugar beet, I am fully of the opinion of Mr. Prince, "that it is a more valuable root than the mangel wurtzel." Ist. As to its nutritive qualities, it is altogether before the mangel wurtzel, for stock. 2d. It is fully equal in quantity as a crop only. For winter use, it is much less liable to decay. I was pleased with Mr. Prince's remarks on the sugar beet, as I know them to be correct from experience.

W. H.

CLIMATE.

The climates of several countries are known to change. In England, the climates have become temperate; and in Charleston, [S. C.] it is otherwise—the sweet orange was once a common inhabitant near Charleston; the climate becoming colder, the orange has removed farther south, except the very sheltered situations. The precise degree of cold that the sweet orange tree will bear, is not known—perhaps not much below 30 degrees, if of long continuance; the sour orange is more hardy, and the citron and lime are less so. The coffee tree, probably, will not bear a degree of cold equal to 41, which produced white frost. The plant delights in a hilly country, a level rich

soil causes it to run much into suckers, and the seeds are of a bad quality, as has been proved in English Naptina, in the island of Trinidad, where the planters neglected it, and destroyed the plantations before 1798. The olive tree perfects its fruit as far north as the Duchy of Milan. The city of Milan is in lat. 45, 2- north, the medium cold temperature of its climate is not known.—This is the coldest climate in which the olive tree is cultivated in Europe. It is not understood in what degree of cold the plant will bear; perhaps no greater than 17 degrees, at which the sap of the tree begins to congeal. The olive would be valuable in Georgia; the young plants should be imported by the government, as it would be too extensive for private adventure. The seeds will not germinate until they have passed through the digestive process in the stomach of the turkey—which divests them of their oil, and fits them for production. It is said that by washing the skin and flesh of the fruit, and digesting them in a solution of alkali, answers the purpose. The greater palm, or date tree, the fruit of which is greatly valued as food for man in northern Africa, Arabia and Persia, would probably answer a similar purpose in most parts of Georgia; but we have no information of the degree of cold it will bear.—The sugar cane perfects its saccharine maturity in Georgia as far north as Milledgeville, in lat. 33, and perhaps farther. The season for manufacturing the sugar is so short, that it has not been attempted as a crop, except on the sea board. In the West Indies, the saccharine maturity of the sugar cane is perfected by the long season of dry weather; in Louisiana, Florida, and Georgia, it is perfected by the cold weather of autumn and winter; when the cold is enough to freeze the cane, it renders the juice unfit to make sugar or syrup. The shea tree, from which the Africans obtain an excellent butter, as we are informed by Barke, and by the Africans themselves, would probably be valuable in some of our warmer climates. If some of our national ships would procure, when on that coast, a few of the plants of shea-butter tree, it would be pleasant to our industrious house wives to have an annual crop of butter from the orchard of fruit trees.

(From the New York Farmer.)

Sir—In your paper of the 17th inst. I noticed a communication from Mr. Ploy, relative to certain remarks contained in my publication, touching synonyms in fruits, part of which he supposes is an oblique hit at him; and he seeks to show that he has not committed the supposed error. I have only to say, that my remarks were general, and I was not previously aware that he was the person who had given the name referred to. As Mr. P. seems to accord with me, as to the impropriety of re-christening fruit, I accede that if his new variety is distinct, he had a right to give it any name he thought proper. I have not seen differences, which I deem sufficient for that purpose, and have found others of the same opinion. It appears the investigations of the Horticultural Society of London have caused them to come to the same conclusion; for by reference to their catalogue of 1826, it will be seen that they have arranged the Emperor of Russia, (the serrated, and the unique) as synonyms for the same peach. It now rests with the public, to test their qualities, and decide whether they are sufficiently distinct to be called by different names.

WM. PRINCE.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 28, 1828.

POTATO.

Sir Joseph Banks (*Hort. Trans.* 1. 8.) considers that the potato was brought to Spain from the mountainous parts of South America, in the neighborhood of Quito. To England, however, this root found its way by a different route, being brought from Virginia by the colonists sent out by Sir Walter Raleigh, in 1586.

Varieties. These are very numerous, not only from the facility of procuring new sorts by raising them from seed, but because any variety cultivated for a few years, in the same soil and situation, as in the same garden or farm, acquires a peculiarity of character and habit, which distinguishes it from the same variety in a different soil and situation. Dr. Hunter, in his *Georgical Essays*, has supposed the duration of a variety is limited to fourteen years; and Knight concurs with him in opinion. Potatoes, which are excellent in Ireland, Nova Scotia, and other high northern latitudes, do not answer a good purpose in New England. The potato taken from the South, prospers better, such as the River Plate, or red potato—which has succeeded well in Massachusetts. Loudon asserts that the best mode to order potatos for seed, is, to give a general description of the size, color, form, and quality wanted, and whether for an early or late crop, without being guided by the names attached to any varieties.

Propagation. The potato may be propagated from seed, cuttings, or layers of the green shoots, sprouts from the eyes of the tubers, [buds] or portions of the tubers containing a root or eye, or by planting the tubers whole. The object of the first method, is to procure a new or improved variety; of the second, little more than curiosity, or to multiply as quickly as possible a rare sort; and of the third, to save the tubers for food. The methods by portions of the tubers, [the roots cut in pieces] or whole potatoes, is the best, and almost universally practised, for the general purposes of field and garden culture.

By seed.—"Take the apples in the beginning of October, [or whenever they are ripe] before the frost has hurt them, hang them up by the foot stalks in a dry closet, where they will not freeze; let them hang till March, or April; then mash the apples, wash the seeds from the pulp, and dry them in a sunny window. Sow the seeds in a bed about the first of May. When the plants are four or five inches high, transplant them into ground well prepared, one or two plants in a hill." (*Dean*) Seeds from the same ball will produce a great variety of kinds, some of which may be of little value; and in order to make the most of such experiments, it will be well to proceed according to the following directions, extracted from some remarks by Col. Pickering, contained in a pamphlet published by the Essex Agricultural Society: this Society having awarded premiums for the best potatos raised from the seed.

1. "Sowing the seeds in the same ball will produce various sorts of potatos, it will be indispensably necessary, that each young plant grows at the distance of eight or ten inches apart.

2. "In autumn, or as soon as the vines, or stems of the plants die, and the young potatos are dug up, those of each plant are to be saved by themselves, and it will be easy to put each sort in a separate paper bag. Those potatos will be very

small, perhaps from the size of a pigeon's down to a sparrow's egg.

3. "In the ensuing spring, the potatos of each sort, that is, the potatos of each bag, must be planted by themselves; and if not in distinct rows, then stakes driven into the ground, should mark the divisions of the several sorts in the same rows, leaving a space of about two feet between one sort and another, to guard against any mixture.

4. "In the time for harvesting them in the second year, the potatos, [if grown in a good soil] will be large enough to be boiled to ascertain their quality. Each sort must be tried by itself. Such as are watery, and ill flavored, may be at once thrown aside, for the use of live stock. Every other sort, so valuable as to be thought worth cultivating, must be kept unmix'd, by putting each kind in a separate bag or cask."

The modes of propagating by layers, cuttings, suckers, sprouts, &c. are rather curious than useful, and are therefore here omitted, but may be seen in detail in the *Encyc. of Gard.* page 620.

By portions of the tubers. [or cuttings of the potato]. "In making the sets or sections, reject the extreme or watery end of the tuber, as apt to run too much to haulm, [vine] and having the eyes small, and in a cluster; reject also the root, or dry end, as more likely to be tardy in growth, and produce the curl. Then divide the middle of the potato, so as to have not more than one good eye in each set. When the potato scoop, [an instrument for digging out the eye of potatos] is used, take care to apply it so as the eye or bud may be in the centre of each set, which this instrument produces, of a semi-globular form. The larger the portion of tuber left to each eye, so much the greater will be the progress of the young plants."

By some experiments which were made by J. Whitlaw, Esq. and given in detail, in the *N. E. Farmer*, Vol. i, page 53, and Vol. iv, page 314—these two important facts were made apparent: 1st. Large potatos are much better for seed than small ones. 2d. It is best to cut off the butt and top ends from each potato, and cut the middle pieces into quarters, before planting. Knight, the famous English horticulturist, has found that for a late crop small sets [seed potatos] may be used; because the plants of the late varieties always acquire considerable age before they begin to generate tubers; but for an early crop, he recommends the largest tubers; and he has found that these not only afford very strong plants, but also such as readily recover when injured by frost; for, being fed by a copious reservoir beneath the soil, a re-production of vigorous stems and foliage soon takes place, when those first produced are destroyed by frost or other cause. He adds, "when the planter is anxious to obtain a crop within the least possible time, he will find the position in which the tubers are placed to vegetate, by no means a point of indifference; for these being shoots or branches, which have grown thick instead of elongating, retain the disposition of branches to propel the sap to their leading buds, or points most distant from the stems of the plants of which they once formed parts. If the tubers be placed with their leading buds upwards, a few very strong and very early shoots will spring from them; but if their position be reversed, many weaker and later shoots will be produced; and not only the earliness, but the quality of the produce, in size, will be much affected."

M'Mahon advises to cut seed potatos "a week

before planting, in order that the wounds should have time to form a dry crust; for if planted immediately after being cut, they imbibe too much moisture, many of them rot, and the rest are greatly weakened thereby." Some advise to wet seed potatos, and roll them in pulverized plaster of Paris, immediately before planting.

From an experiment made by a person in the employ of the Hon. Josiah Quincy, the particulars of which are given in *Mass. Agr. Repos.* Vol. v, p. 64, it appears that the product of certain rows, planted with whole potatos, exceeded an equal extent of adjoining rows more than one third. A writer for the *N. E. Farmer* Vol. i, p. 330, gives an experiment, which tends to the conclusion that potatos, planted whole produce more than those which are cut. The experiments of most cultivators, however, are in favor of cutting. Dr. Cooper in the last Philadelphia edition of *Willch's Domestic Encyclopedia*, says, "The best mode [with regard to seed potatos,] appears to be this; choose your potatos for planting of a moderate size rather large than small, for there is no good reason to be assigned for breeding from diminutive parents, cut your potatos into sets, two eyes to a set; throw away without hesitation into the hog trough all the inferior and diminutive eyes, choosing your sets from the middle of the potato, do not cut the potato down the middle. Loudon observes "In preparing the sets of potatos some cultivators recommend large sets, other small potatos entire. Others, on the ground of experience are equally strenuous in support of small cuttings, sprouts, shoots, or even only the eyes or buds. With all these different sorts of sets, good crops are stated to have been raised, though tolerable sized cuttings of pretty large potatos, with two or three good eyes or buds in each, are probably to be preferred. A very slight exercise of common sense might have saved the advocates of shoots, scooped out eyes, &c. their experiments, and arguments; it being evident, as Brown has observed, to every one that has any practical knowledge of the nature of vegetables that the strength of the stem in the outset, depends in direct proportion upon the vigor and power of the set. The set, therefore, ought to be large, rarely smaller than the fourth part of the potato; and if the root is of small size, one half of the potato may be profitably used. At all events, rather err in giving over large sets, than in making them too small; because, by the first error, no great loss can be sustained; whereas, by the other, a feeble and late crop may be the consequence." *Dean* says, "the shooting parts exist in a potato, in the form of a tree, of which the stock is at the butt or root end. I therefore take care to cut athwart those parts as little as possible; though they will grow any way, the greater length of shooting stem there is in a set, the more strong and vigorous will be its growth at first."

Quantity of sets. Abercrombie directs, "for a plot of the early and secondary crops, eight feet wide by sixteen in length, planted in rows, fifteen inches asunder by nine inches in the row, a quarter of a peck of roots or cuttings. For full timed and main crops, a compartment, twelve feet wide by thirty-two in length, planted in rows, two feet distant, half a peck. For field cultivation, English writers say that it requires twenty bushels and a half to plant an acre with cut potatos; and thirty seven bushels and a quarter of whole potatos.

(To be continued.)

TO CORRESPONDENTS.—A communication from Worcester, on Bees; Likewise, Communications on Seeds—Insectivore Birds—on Salsify, or Vegetable Onion—on Tart Rhubarb—on Gourds—on the Profiter, or Tree Onion, and on the Lime Plant, will soon appear, from the pen of a respected correspondent.

Horse Wanted.

A gentleman who is located in a section of Massachusetts where there are many descriptions of raising colts, wishes to hire for the season, a full blood or cold blood Stallion, or if the owner prefer, would board the horse (and a groom if desired) at a very low rate.—Enquire at this office. March 23.

SUPERB BULBOUS ROOTS.

Just received at the New England Farmer Seed Establishment, a fine collection of superior bulbous roots, suitable for spring planting. Consisting of black, purple, orange, violet, crimson, red, broken bronze, and white colored DOUBLE MEXICAN DAHLIAS. Also, Ferraria Tigrida, or Mexican Tiger Flower—Amaryllis Formosissima, or Jacobean Lily—Double Tuberoses, and Ranunculus; paintings of which may be seen at this place. The above collection of bulbs is in fine order, and from the same house from which we obtained the Bulbous Roots last autumn, which give us such uncommon satisfaction.

Just received direct from Glasgow, Scotland, a large collection of STOUT GOOSEBERRY BUSHES, of the largest and finest fruit, done up in bundles of six roots each with the name marked—price \$1.50 per bundle. Specimens of the fruit, preserved, measuring four inches in circumference, may be seen at this place. A supply of the Roots of WILMOT'S SUPERB STRAWBERRY—measuring six and eight inches in circumference, is daily expected from Europe.

At this place is kept a large variety of Ornamental Flower Seeds, (of 300 different sorts) in papers of 6 cents each, or \$5 per hundred, assorted; the names of which it is of course impracticable to give here. The collection comprises many French sorts, and the new ones introduced by Nuttall, from Missouri, and the Rocky Mountains.

A few barrels of superior Early Manly Potatoes, have been received. This is the same sort as those sold at this place last year, which gave universal satisfaction, as to uncommon earliness, and good quality.

N. DAVENPORT offers for sale at his Nursery, in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Pears, cherries, Prunes, Nectarines, &c. Gooseberry and Currant Bushes. A list of which can be seen at his office at the New England Farmer or Agricultural Warehouse—and will be inserted in the New England Farmer occasionally. At this Nursery, however, it is not so much an object to present the imposing display of a great number of the names of different fruit as to keep a choice collection of those sorts, whose excellence is well known and established. Orders are respectfully solicited, and will receive prompt attention if left with J. R. NEWELL, at the Agricultural Establishment, No. 52 North Market street; or with FREDERICK DAVENPORT, No. 713 Washington Street—or at the Nursery in Milton. Feb. 29.

Landreth's Nurseries—Near Philadelphia.

From the patronage already extended the Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to their other Nurseries, as offering peculiar facilities for the requirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Plants is not surpassed in the United States in this country. It embraces most of the celebrated kinds of European and American varieties, which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to grow, and the most desirable varieties, the proprietors, without any further application for seedling, will be pleased to furnish them. The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and aquatics are continually making.

The plants here to grow, and the Garden Seeds are grown almost every variety of Esculent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seedling—in short, the whole process of cultivation, gathering, &c. all being under their own personal superintendance, necessarily compares in any eminent degree, to obviate the errors and imperfections, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded. Feb. 15.

D. & C. LANDRETH.

Farmer Wanted

A young farmer with his wife, is wanted, to take charge of a farm about 10 miles from New Haven. A young Massachusetts farmer who thoroughly understands his business, and whose wife is acquainted with the management of a dairy, and who can furnish testimony of economy, neatness, and industry, will have an opportunity to make a permanent and advantageous bargain. Inquire at the New England Farmer Office. New York, March 23, 1838.

Isabella Grape.

Vines of the ISABELLA GRAPE may be had, on application to the Subscriber, in Dorchester, or at his office, 71 2 Congress Street. ZEB. COOK, Jr.

Wanted as above, a first rate Gardener, who can produce satisfactory recommendations. At March 21

Milk Carriage.

For sale, a new Milk Carriage—inquire of Walter Frost, No. 18 Common street. Boston. March 21

JAMES BLOODGOOD & Co's. Nursery, at Flushing, on Long Island, near New York.

IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists, who may be desirous of stocking their gardens with Fruit Trees, of the finest sorts, and most healthy and vigorous stocks the present season. BLOODGOOD & Co. attend personally to the Inoculating and Engrafting of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove genuine. The subscriber, Agent of the above Nursery, will receive orders for any quantity of FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him. The reputation of this Nursery is so extensively known, and has been so well sustained, that it is unnecessary to refer those in want of Trees, to the names of the Horticulturists in this City, as its vicinity; and if further demonstration is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Orders for Trees will be delivered gratis, on application to ZEB. COOK, Jr. Rogers' Buildings—Congress St.

hose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 89 hundred Red Rose bushes—50 do. Provence, or Callega 10 do. four seasons—30 do. Damask—30 do. Burgundy—5 do. Astrucan—25 do. Marais—10 do. Trianon—100 do. Tree—1 do. very large pots monthly Roses, six years old, and in prime health—5 varieties Double Dollars—Single, do.—8 Livingstonia Indica, or Crapè Myrtle, two of which are 20 years old—200 Grape Vines, (White Sweet water)—Snow ball Bushes—White Lilies—Red and White Lilies.

20 Double-pinn Double and Single double Rose Water, made entirely from Danish Rosess. The above Rose Water is constantly kept for sale at Mr. C. Webb's Porter Cellar, No. 12 Mercantile Row, by Donjon or less quantity. 6t March 11

Greenwich Garden.

Cannie & Varick streets, and 5 minutes walk from St. Thomas Church, Broadway, and 10 from the City Hall, is now under cultivation, to which a premium has been awarded by the New York Horticultural Society. Other Shrubs and Trees, in great abundance. The Hyacinth, Narcissus, Crocus, &c. are now in bloom, will continue in succession the greatest part of the year; and will be well worthy a visit to the Garden and Green-house, by any lady or gentleman in or near the city. If any persons, farmers, or Gardeners, Trees, and Shrubs, (pruned or trained, at the shortest notice. Asparagus (plants of the first quality. Catalogues may be had at the Garden, gratis. Orders from any part of the Union will be strictly attended to. Gentlemen supplied with experienced Gardeners. Likewise, situations kept for Gardeners of industrious, sober habits, and that perfectly understand their business, none other need apply.

superior quality. Du Pont's Gun Powder, at 23 to 50 cts per pound—Shot—Balls—Plugs and Percussion Caps. Also, Albin—Richard—Sash—Petrie—Blue Vitrol, &c. constantly for sale at the Dupont Powder Store, No. 63 Broad street—By E. COPELAND. If The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. March 11

Fruit and Ornamental Trees.

The KERRICK MESSRS in New York, near Brighton, are the great nursery in New England for sale at the Dupont Powder Store, No. 63 Broad street. examine for themselves—and make their own selection. The Apple and Peach Trees are extraordinary in size, variety, and fruitness. Written orders addressed to JOHN or WM. KERRICK and sent to the New York Post office, or left with Joseph B. Alden, agent, in Court street, where Catalogues may be had gratis, will be carefully attended to. Trees will be suitably packed for shipping or land conveyance, and delivered in Boston when desired. Gentlemen living at a distance, however, should have agents in the city to receive and pay for them. Mar. 11

Garden Seeds.

The subscriber has for sale a very large assortment of fresh and genuine Garden Seeds, from the New England Farmer Seed Establishment, Boston. Likewise, a few pounds Lathere Seed. Newburyport, March 21. E. STIDMAN.

50,000.

For sale, Forty Thousand engrafted APPLE TREES, from two to four years from the graft—consisting of forty-three varieties of the most approved and superior Fruit; including early autumn and winter Apples. Also, other Fruit and Ornamental Trees. Orders may be sent to this place via Post office, directed to FRANCIS WINSHIP. Brighton, March 21st, 1838

PRICES OF COUNTRY PRODUCE.

Table listing prices for various goods including Apples, Beans, Butter, Cheese, Flour, Grain, Hog's Lard, Milk, Pork, Seeds, and Eggs. Columns include item names, units, and prices.

MISCELLANIES.

THE DEITY.

Not in the solitude
Alone may man commune with heaven, or see,
Only on savage wood
And sunny vale, the present Deity;
Or only hear his voice
Where the winds whisper and the waves rejoice

Even here I do behold
Thy steps, Almighty!—here, amidst the crowd
Through the great city roiled
With everlasting murmur, deep and loud,
Clanking the wags that wind
Amongst the proud piles, the work of human kind.

The golden smushie comes
From the round heaven, and on its dwelling lies,
And lights their inner homes;
For them thou fillst with air the unbounded skies.
And givest them the stores
Of ocean, and the harvest of its shores.

Thy spirit is around,
Quickening the restless mass that sweep along;
And this eternal sound,
Voices and footfalls of the numberless throng.
Like the resounding sea,
Or like the ramy tempest, speaks of Thee.

And when the hours of rest
Come, like a calm upon the mad sea brine,
Hushing its billowy breast,
The quiet of that moment too is thine;
It breaths of Him who keeps
The vast and helpless city while it sleeps.

As Sir Walter Scott was riding (a few weeks ago) with a friend in the neighborhood of Abbotsford, he came to a field gate, which an Irish beggar, who happened to be near, hastened to open for him. Sir Walter was desirous of rewarding the civility by the present of sixpence, but found that he had not so small a coin in his purse. "Here, my good fellow," said the Baronet, "here is a shilling for you; but mind, you owe me sixpence." "God bless your Honor!" exclaimed Pat, "may your Honor live till I pay you!"—*Literary Gaz.*

In *Englishman's account of New England Farmers*.—The whole country, (New-England, United States,) are going mad about manufactures, and water powers and water privileges. New England, however, does seem to be admirably fitted for a manufacturing, and not for an agricultural nation. There is not much improvement in husbandry here, though the people have a strange look of property and comfort, and all the rocks, and rivers, and woods, of New England, are swarming with healthy and happy children. How they are fed, God only knows: for not a thousandth part of the soil is properly cultivated, and it is a very difficult thing for a farmer to sell enough from what is raised on his farm, or in his dairy or poultry yard, to pay his yearly taxes, which are little or nothing. And yet no one ever saw, or heard of, so happy a people. They are crowded with children—well educated, well clothed, healthy children—with enough to eat and drink, with a horse or two for every farm, a few cows, a few sheep, a few pigs, plenty of poultry, and two or three yoke of fine cattle: and so happy are they, and so far from feeling poor, that, in nine families out of ten, they would think no more of adopting a stray child that might come in their

way, than most people would of giving it a dinner. Wages on a farm are one dollar (4s. 6d.) a day, or 12 dollars a month the whole year round (2l. 14s.) or 120 dollars per year (32l. 2s.) In all these cases the laborer is found. In the haying season he may earn one dollar and fifty cents, or 6s. 9d. a day.—*Notes of a Tour through New-England in 1832.*

Mode of travelling in Russia.—As soon as winter sets in, that is, as soon as the sea which is now agitated by the slightest wind, becomes a solid mass, the road is marked out on the ice which leads from Petersburg to Kronstadt: this is done by a line of large buoys. About every league are stationed six sentry boxes, well armed, and the centinels, during foggy weather, keep up fires at certain distances, and, by the tinkling of bells, serve as a security and guide to the traveller.—About half way is established a restaurant. The innumerable crowds of people, of all ages and both sexes enveloped in their large pelisses, and gliding with indifference upon the fragile surface, which alone separates them from the abyss beneath, offer to the inhabitants of a southern country a strange sight, and impress him with a feeling of terror quite unknown to a northern people. But it is when they begin to run the *bouers*, that the road to Kronstadt represents the most animated picture. These bouers are boats fixed on two plates or blades of iron like skates, with a third which is adapted like a rudder. Seats are arranged round this hack, which has one, two, or sometimes three masts. Driven before a wind which always blows with violence during this season, and directed by an able pilot, these boats, distinguished by their variety of rigging and flags of different colours, skim along the surface with inconceivable rapidity. A pale sun lends its rays to the scene, but imparts no heat; the sails are unfurled; the north wind whistles; the boats dart forward; and the sailors, by skillful manœuvres, endeavor to pass each other; and thus, in less than an hour, you glide through a space of ten leagues.—*Ancelet's Travels in Russia, in 1820.*

An English merchant, established at Hammersfelt, has founded a colony of 25 Laplanders and other Northern Europeans, at Spitzbergen, to collect furs. The brother of the undertaker is at the head of the establishment. They have convenient houses; the climate is very healthy, and not too cold to prevent hunting; no one has been sick for the three years that the colony has existed.—Every year a ship brings provisions and takes away the furs.

Never make an enemy, or lose a friend, unnecessarily.

Fruit Trees.

WILLIAM PRINCE, the Proprietor of the Linnean Botanic Garden and Nurseries at Fushing, Long Island, has the pleasure of informing the public, that his Nursery now contains 172 varieties of the Apple—22 do. of the Pear—70 do. of Cherries—30 do. of Plums—25 do. of Apricots—34 do. of Peaches—2 do. of Nectarines—1 do. of Almonds—14 do. of Mulberries—1 do. of Quinces—16 do. of Figs—16 do. of Currants—13 do. of Raspberries—17 do. of Gooseberries—2 do. of Strawberries—257 do. of Grapes—6 do. of Ornamental Trees, &c. Above 5 of the above kinds of Fruit are not to be found in any other collection in America. The different varieties cannot be adverted to as genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J. R. Newell, at the Agricultural Warehouse, 52 North Market Street, gratis; and orders left there, or sent by mail, will meet prompt attention. March 11

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New-England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New-England, of the crops of 1837. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

- | | |
|--|---------------------------------------|
| <i>Artichoke</i> , Green Globe | <i>Melon</i> , Fine Apple |
| <i>Asparagus</i> , Devonshire | <i>Green Cucumber</i> |
| Gravesend | <i>Persian</i> |
| Battersea | <i>Nutmeg</i> |
| Large white Reading | <i>Large Cateleupe</i> |
| <i>Beans</i> , (26 varieties,) including | <i>Pomegranate</i> , or <i>Musk</i> |
| the English broad beans; | <i>Carolina Water</i> |
| dwarfs and pole. | <i>Long Island Water</i> |
| <i>Bets</i> , Early Long Blade | <i>Apple seeded, Water</i> |
| Early Blood Turnip | <i>Majoran</i> |
| Early White Scarcity | <i>Moscho, White and Brown</i> |
| French Sugar, or Amber | <i>Nasturtium</i> |
| Orange | <i>Mangel Wurtzel</i> |
| Green, (for soups, &c.) | <i>Oliva</i> |
| <i>Broccoli</i> , Early White | <i>Onion</i> , Potatoe |
| Early Purple | <i>White Portugal</i> |
| Large Cape | <i>Yellow</i> |
| <i>Brussels Spouts</i> , Madeira | <i>Stratsburg</i> |
| <i>Cabbage</i> , Early Salisbury dwarf | <i>Large Red</i> |
| Early York | <i>Parsley</i> , Ciliated |
| Early Dutch | Dwarf Curled |
| Early Sugarloaf | Curled, or Double |
| Early Lou, Battersea | <i>Parsnip</i> , Large Dutch swelling |
| Early Emperor | Silver Skinned |
| Early Wellington | <i>Peas</i> , Early Washington |
| Large Bergen, &c. | Early double blossomed |
| Large Cape Savoy | Early Fane |
| Large Scotch | Early Golden Hopsur |
| Large Green glabrous | Early Charlton |
| Large late Drumhead | Early Strawberry Imperial |
| Tree, or 1000 headed | Dwarf Blue Dwarf |
| Green Globe Savoy | Dwarf Blue Prussian |
| Red Dutch | Dwarf Spanish, or Fan |
| Yellow Savoy | Dwarf Marrowfat |
| Turnip rootel, &c. | Dwarf Sugar |
| Russian | Matchless, or Tall Mar. |
| Late Imperial | Knight's Tall Marrows |
| Late Sugarloaf | Tall Crooked pod Sugar |
| <i>Cardoon</i> , Peppers, Long, or Cayenne | |
| <i>Carrots</i> , Atringham | Tomato, or Squash |
| Early Horn | Cherry |
| Blood Red (for West India market) | <i>Pumpkins</i> , Finest Family |
| Lenon | Connecticut Field |
| Long Orange | Mammoth |
| Cremor | <i>Radish</i> , Early Frame |
| <i>Cauliflower</i> , Early and Late | Short top Scarlet |
| <i>Celery</i> , White solid | Long Salmon |
| Rose coloured or Garden | Purple Short Top |
| Italian | Long white, or Naples |
| Celeric, or turnip rooted | Cherry |
| <i>Chervil</i> , Violet colored, | |
| <i>Chives</i> , White Turnip Rooted | |
| <i>Corn Salad</i> , or Veticok | Black Fall, or Spanish |
| <i>Cress</i> , Broad leaved or Garden | |
| Water | <i>Rhubarb</i> , for tarts, &c. |
| Long Orange | <i>Ruta Baga</i> , |
| <i>Cucumber</i> , Early Frame | <i>Salsify</i> , or vegetable oyster |
| Green Cluster | <i>Sau Kale</i> , |
| Short Prickly | <i>Skirret</i> |
| Long Prickly | <i>Sarcocoma</i> |
| Long Green Turkey | <i>Saffron</i> |
| Long white Turkey | <i>Spinach</i> , New Zealand |
| White Spined | Prickly, or Fall |
| Small Girkin, &c. | Round leaved summer |
| <i>Egg Plant</i> , Purple | Eng. Patience Dock |
| White | <i>Sage</i> , |
| <i>Dahlia</i> , Green | <i>Squash</i> , |
| White Curled | Early bush Summer |
| broad leaved Batavian | Long Crook Neck |
| <i>Garden Burnet</i> | Vegetable Marrow |
| <i>Galic Sotts</i> | Porter's Valparaiso |
| <i>Indian Corn</i> , (several varieties) | Acorn |
| Purple curled | <i>Tomatos</i> , |
| Green curly Scotch | <i>Turneps</i> , |
| <i>Leek</i> , London | Early White Dutch |
| Large Scotch | Early Garden Stone |
| <i>Lettuce</i> , Early Curled Silesia | White Flat, or Globe |
| Large Green head | Green Round |
| Royal Cape | Red Round |
| Imperial | Swain's Egg |
| Hardy Green | Large Egg, Norfolk |
| Brown Dutch | Long Tankard |
| Grand Admiral | Long Yellow French |
| Tennis-ball, or Rose | Yellow Dutch |
| Drumhead | Yellow Maltese |
| Magnon Bonam Coss | Yellow Aberdeen |
| Ball Coss | Yellow Stone |
| Ice Coss | Yellow Swiss Dutch |
| White Coss, or Leaf | <i>Thyme—Sweet Basil—Borage,</i> |
| Green Coss | <i>f. a. corder—Rosemary—Hyssop,</i> |
| | <i>Wormwood—Sage—Savory,</i> |
| | <i>Penny royl—Spikenard—Dill,</i> |
| | <i>Balm—Tansy—Bore. &c.</i> |

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

SEEDS.

Sir.—In order to obtain genuine seed, the parent plants of the same tribe or family, should be set at some distance from each species; otherwise, the different kinds will be liable to be crossed or mixed. No plants, but the most perfect should be planted for seed, and no inferior plant of the same species should be allowed to flower near them.

Intermarriages are not confined to the animal creation—they are very frequent in the vegetable kingdom; and in such cases, the offspring is different from either of the parents'. Thus the union between a *pumpkin* and a *squash* will produce a progeny resembling neither the one parent, nor the other; as is well known to every observing farmer. There can be no intermarriages between a cabbage and a beet; but cabbages of different species, and beets of different kinds, seem to have a strong inclination to the union in their respective families, and the same may be said of many other tribes of vegetables.

And after all the care and precaution, various kinds of plants are liable to be crossed, more or less, in consequence of bees and other insects conveying the farina, or fertilizing dust, from plant to plant.

The soundness of seeds may be, generally, ascertained by putting a few of them into warm water. If they sink, there can be no doubt, as to their soundness. But as many kinds of seeds are very light, or covered with hairs or a light buoyant substance, or have light appendages attached to them, will not sink immediately; therefore, let a few remain in the water an hour, or until they are thoroughly wet, and if they then fall below the surface of the water the presumption is that they are good. The unsoundness of seed is generally caused by unripeness, blight, mouldiness, or being improperly exposed to the air.

Seeds should be gathered when perfectly ripe, in a fair day, and spread in a dry room; and after they are thoroughly dried, should be cleansed, and put into paper bags, and the bags, into tight boxes, and the boxes kept in a dry place.

What is said in Cobbett's American Gardener, as to the durability of the vital principle of certain seeds, contained in his list, we consider very incorrect. The durability of the vital principle depends, very much, on their ripeness when gathered, and the manner in which they are preserved.

The integument, which surrounds the seeds of vegetables, is calculated from its durable nature to preserve their principle of vitality, and consequently their principle of germination a long time, when they are kept from the action of the air and moisture. How long the vital principle of seeds, and of course the power of germination, may be preserved, under favorable circumstances, has not yet been accurately ascertained. Instances may be produced, where seeds have germinated after the lapse of thirty or forty years, and even a much longer time. Melon seeds found in the cabinet of lord Mortimer, evidently collected in 1660, were planted in 1762, [102 years afterwards] germinat-

ed and produced fine fruit. But in these cases it must be presumed, that the seeds were well preserved from the effects of the air and moisture.—The power of germination lay dormant, until it was brought into action by the combined powers of heat, air, and moisture; and, in some respects, like the torpid vital principle of loads, incurred many hundred years, in the centre of solid rocks of granite, perfectly secluded from the common air; yet, notwithstanding this great length of time, on being exposed to atmospheric air, aided by the influence of the sun, resume their former, (perhaps antediluvian) vigor and activity.

After all that has, or can be said, generally speaking, seeds of the last year's growth are to be preferred: for they will germinate one or two years, should they not be very nicely preserved.

VERITAS.

Mansfield, March 27, 1828.

FOR THE NEW ENGLAND FARMER.

INSECTIVOROUS BIRDS.

MR. FESSENDEN.—These are to the farmer and gardener of great value. They were designed by the Creator to check the too great increase of insects; and no farmer ought to suffer them to be wantonly destroyed on his premises. The number of insects destroyed by the robin, swallow, sparrow, mock-bird, and other small birds, is astonishing. One little family will destroy several hundreds in a single day. Some little time since, a pair of these small birds built a nest on a lilac, which grew close to one of my windows. In the time of incubation, there was a long and severe storm, and a strong wind. The eggs were in danger of being thrown overboard by the wreathing of the bush. Conscious of this, the female kept on the nest to prevent any accident which might follow on her leaving it, to collect food. Her mate, like a good provider, was busily engaged during the day in collecting food (insects) which he carried to his companion, and she received it of him with apparent affection. This circumstance excited particular attention: and of course this little society was closely observed. In a short time the eggs hatched; but from the roughness of the weather, or tenderness of the brood, the female chose not to leave the young. During this time, the male with surprising industry brought small insects, in the larva state, to the nest, but was not suffered to feed the nestlings. The female received the food, and divided it among her little charge. When the young had gained sufficient strength, the male was permitted to feed them; and from this time, both parents were mutually and incessantly, (by day) employed in collecting small insects from every quarter; and, on a moderate calculation, to the number of about seven hundred in a day.

One great cause of the increase of many insects, so destructive to vegetation, is the decrease of those little friends to the agriculturist. Should a few of them innocently trespass on the property of the farmer, to the amount of a few cents, let him remember, that he is greatly indebted to them for services rendered; and not wage a war of extermination.

They are not merely useful, in destroying insects—for they call the farmer and the gardener to their business—cause the groves to resound with music, and usher in the morning with melodious praise.

R. GREEN

Mansfield, March 27, 1828.

FOR THE NEW ENGLAND FARMER.

BEEES.

Mansfield, April 1, 1828.

MR. FESSENDEN.—Every thing respecting the preservation of these profitable insects is interesting. I was much pleased with the remarks of Medicus, published in the New England Farmer. Vol. vi. No. 26. He observes that the "*bee moth seldom or never perambulates to any considerable height in the atmosphere.*" I had confidence in his plan of converting the garret into an apiary. I suggested the same to an experienced apiarian, who resides in this vicinity; and he informed me, that he had no confidence in it—for on felling a large tree in the woods, he found, more than thirty feet from the stump, the remains of a swarm of bees, with all the appearances of the bee moth—their cocoons or cots were numerous.

Salsafy, or Vegetable Oyster.—This plant (*Tragopogon parifolius*) is biennial, and the root is a good substitute for the real oyster. It is of easy cultivation in a deep rich soil. The young plants are not so liable to be destroyed by insects, as most other biennials. The roots are white, and shaped like a parsnip. They may be taken up late in the autumn, and secured in moist sand from the air; or be suffered to remain out, and dug up when wanted. Every lover of oysters, who lives at a distance from the sea-shore, will wish to cultivate this plant, after he has once eaten them, when properly prepared for the table.

Mode of cooking.—Wash the roots and cut them transversely into thin pieces—boil them in a little water, or milk and water—when boiled soft, mash them, and thicken the whole with flour to some degree of stiffness—then fry them in the fat of salt pork or butter. They are a luxury.

Lime Plant.—This plant (*Podophyllum peltatum*) is a singular production of nature. The stem, foliage, flower, and fruit are formed in the earth and after the plant has come up, there is nothing more, than the extension of parts. The stems, at the height of from eight to twelve inches, branch out in two arms, at the extremity of each is a large palmated leaf. In the fork proceeds the fruit stem. The first that is seen in the spring is a delicate membranous cap, which is soon burst open by the flower bud, which is large, white, and round. The shoulders and arms, lying close to the stem or trunk soon appear, and as the plant rises, the fruit stem elongates and the arms elevate themselves. The fruit is about the size of a large lunc, green while growing, and yellow when ripe; has the flavor of a pine-apple; and as to eating, but little inferior to that fruit. The plant requires a moist soil in a shady situation. May be propagated by seed, but best by dividing the roots, which are creeping and jointed. The root is medicinal.

Tart Rhubarb, or Pie Plant.—The cultivation of this useful plant has been greatly neglected. It is hardy, delights in a deep rich soil, and is easily propagated by seed, or off-sets. Many tons of the stems are annually sold in the city of London.—The leaf stems, which are long and large, are only used for culinary purposes. They possess an agreeable acid, much admired, and are a good substitute for sour apples—requiring much sugar. If the seed stalks be broken off while young, the leaf stems will be larger and more numerous.—The young plants are delicate and require some little attention the first year.

For Pies. Strip off the rind, and the stems are in the same state of preparation, as paired green apples—the remaining part of the process is the same.

For Tart. Strip off the rind, and cut the stems transversely—stew and press out the pulp, and then proceed according to art.

Pies and carts properly made of this vegetable, are inferior to none.

Prolific, or Tree Onion.—These onions are very early, and produce bulbs of a good size the first year—and in the second year, a bunch of small ones on the top of the seed stalk, about which, small heads of seed frequently shoot out, resembling the seed of other species of onions. The bulbs which proceed from the top, are from the size of a large pea to that of a large horse chestnut. Those of the middle size are better for planting, than those that are larger, as they will not throw up seed stalks the first year, of course the bulbs will be larger and better. They should be planted very early in the spring, in rows ten or twelve inches asunder, and set two or three inches apart, and one inch deep; taking care to place the bottom of the bulb downwards. They soon spring up, and from their size and vigorous growth, are not liable to be destroyed by insects. Should they put forth seed stalks, (as many of the larger ones will) break them off soon after they appear, otherwise the bulbs at the bottom will not be so large. These onions are mild, and are, generally, raised with less trouble than the common species.

Gourds.—There are several species. They are great runners, and when they do well, make a handsome appearance. They are not liable to be injured; for no creature will eat them. They should be planted early and near some wall or fence, which they will soon cover. The large Bottle Gourds, (*Cucurbita lagenaria*) are from ten to fifteen inches in length, and the shells will hold from one to three quarts. They are light and make good dippers, and with good usage will last years. If, after a few gourds have set, the ends of the vines be pinched off, the fruit will be larger and better. The Bicolored Gourd (*Cucurbita bicolor*) is a small, beautiful round fruit, one part a deep green and the other a bright yellow. Only ornament 1.

GOOSEBERRY BUSHES.

The following directions for the management of Gooseberry bushes, were written by an English cultivator in Lancashire, England, and accompanied some bushes sent to a gentleman in this city, who has politely offered them for publication in the *New England Farmer*.

If upon a clay bottom let there be from two to three feet good soil upon the clay before you

place the plant upon the said soil, but to form a convex of about two or three inches so that the bottom or lower extremity of the trunk may be two or three inches higher than the extremity of the roots,—if it be a heavy soil it would be better to get some coarse sand out of a water course and mix it well with the soil, in such proportion as may make it appear lightish, probably 20 per cent of sand,—after setting the plant and spreading the roots upon the soil as before described, lay a covering of the same soil upon the top of the roots from four to five inches thick, which will settle down so as not to be more than three inches probably in a short time—this covering should be thicker or thinner as the soil is light or heavy—either before or after you set the plant, let it be well pruned so as there will not be more than two or three buds in a shoot, and particularly as these will be out of the ground some time, they should be cut harder than usual. Gooseberry plants will not thrive unless they are moderately drained or laid dry, this should always be done in a heavy soil, in a light one there is no occasion; in proportion as the soil is light or heavy, so should be the proportion of soil upon the top of the root. It is common here to set them in beds about a yard and a half wide and the plants a yard asunder, varying the depth of the walk as the ground is wet or dry; if it be about right, the roots after setting down ought to be about level, or rather if any thing above the middle of the walk; do not lay any manure upon the surface or any other part of the bed in winter, about the middle of March is about the right time if the weather be favourable. Common dung out of a midden, will do, but it is better to mix it in the winter with soil half and half, and give it a turn or two before using; never take any soil from the root to make room for the manure, but lay it upon the top with a light covering of soil, as well to make it look neat as to keep the sun from parching it.

If after the trees are landed they should live and seem as if they would answer, I shall be glad to give some other instructions more minute. I do not know whether you will understand all the above, as I have written in very great haste.

Yours, &c.

P. S.—I forget to mention that if the trees are strongish grown and a good weight of manure placed upon them for that purpose, it is quite necessary to take the manure off again when or after the fruit are gotten, or the roots will probably rot in the winter. This second hand manure will do very well mixed up again in the manure for the succeeding year.

FOR THE NEW ENGLAND FARMER.

BEEES.

MR. FESSENDEN,—FEELING anxious to obtain information relative to the management of bees, I would cheerfully communicate to others, any facts or information I may possess, which might have a tendency to promote an object so interesting and important. Should the following narration and accompanying remarks, produce such an effect in any degree, the object of the writer will be accomplished.

In the *N. E. Farmer*, vol. iv. page 138 is an account of an extraordinary produce of honey, obtained by Mr. E. Williams of Ashfield, in which it is stated that he so managed a hive of bees, as to prevent their swarming, and having kept them

six years, took them up, and after making half a barrel of methueglin, had 293 pounds of strained honey, and 91 lbs. of excellent honey in the comb, making 384 lbs. He also made 47 pounds of bees-wax. Mr. Williams some time since related to me some particulars respecting this extraordinary production, the substance of which I will now state.—He bought a swarm of bees, of middling size, and having no convenient place near his house, where he could set them, he built a shelter several rods distant, so situated that they might swarm and go off without being discovered. To prevent their swarming, he added other hives to the original one in the following manner: first making a large hive with a hole through the top, three or four inches square, on which he placed his hive of bees, having a hole two inches square through the right and left sides of the new or lower hive, at the bottom, then made other large hives with holes through two sides similar to the first, with cleets nailed around each of these holes, so as to come in exact contact with each other when placed on the stand, and in this way connected them together, giving the bees a chance to pass and re-pass through the whole range of hives, having them go in and out at the front of each one, as they found most convenient. By this kind of management, his bees spread and increased, and soon became a numerous and powerful community, and eventually yielded the extraordinary and valuable production which has already been stated.

In regard to wintering bees I will venture a few remarks. Many a hive of bees is undoubtedly lost merely for the want of proper management,—they are left to starve and die, when a little care and attention might preserve them from destruction and prevent the loss. If bees are kept in a dark cellar through the winter, they will spend but very little if any of their stock of provisions, as they immediately become dormant, and so remain until they are removed to a different situation. In this way I have frequently preserved them through the winter, when they would probably have perished within a month, after they were unable to obtain their living abroad, had they been left to take care of themselves.

I once had a swarm of bees come out late in the summer, and when the season of their labors was over, the crown of a common hut would probably have contained the bees and all they had collected. I put this swarm of bees into a cellar, where they lived through the winter, and the next season they filled their hive and swarmed twice. This may appear incredible to some, but those who doubt the correctness of what I have stated if they try the experiment, I doubt not will find that I have not overleaped the bounds of truth. I could relate other similar instances but I deem it unnecessary, as a word to the wise is sufficient.

Worcester, March 30, 1828. A FARMER.

MR. FESSENDEN,—The enclosed is from Henderson's Treatise on Swine, and is an amusing account of the "Early Days of the Porcellian Club" in Scotland. I thought at least that it would entertain you, and is at your service to use as you please.—Yours, &c. Salem, March 28.

Though swine were kept so early in the south of England, it appears from the following anecdote that they were very little known in the north of England and south of Scotland.—Within the

la. (probably about ninety years ago), a person in the parish of Rothwell, in Dumfriesshire, called the 'Gudeman o' the Brae,' received a young swine as a present from some distant part, which, from all the information I could get, seems to have been the first ever seen in that part of the country. This pig having strayed across the Lochare into the adjoining parish of Carclavac, a woman who was herding cattle on the marsh, by the sea side, was very much alarmed at the sight of a living creature, that she had never seen nor heard of before, approaching her straight from the shore as if it had come out of the sea, and ran home to the village of Blackshaw screaming. As she ran, it ran, snorting and grunting after her, seeming glad it had met with a companion. She arrived at the village so exhausted and terrified, that before she could get her story told she fainted away. By the time she came to herself a crowd of people had collected to see what was the matter, when she told them, that 'There was a de'il came out of the sea with two horns in his head (most likely the swine had pricked ears) and chased her, roaring and gaping all the way at her heels, and she was sure it was not far off.' A man called Wills Tom, an old schoolmaster, said if he could see it he would 'cungere the de'il,' and got a bible and an old sword. It immediately started up at his back and gave a loud grumph, which put him into such a fright that his hair stood upright on his head, and he was obliged to be carried from the field half dead. The whole crowd ran some one way and some another; some reached the house tops, and others shut themselves up in barns and byres. At last one at the house top called out it was 'the Gudeman o' the Brae's grumphy,' he having seen it before. The affray was settled, and the people mostly reconciled, although some still entertained frightful thoughts about it, and durst not go over the door to a neighbour's house after dark without one to set or cry them. One of the crowd who had some compassion on the creature, called out, 'give it a lock of straw to eat, it will be hungry.'

Next day it was conveyed over the Lochare, and it seemed to find its way home. It being near the dusk of evening, it came grunting up to two men pulling thistles on the farm of Cockpool.—They were much alarmed at the sight, and mounted two old horses they had tethered beside them, intending to make their way home. In the meantime the pig got between them and the houses, which caused them to scamper out of the way and land in Lochare moss, where one of their horses was drowned, and the other with difficulty relieved. The night being dark, they durst not part one from the other to call for assistance, lest the monster should find them out and attack them singly; nor durst they speak above their breath for fear of being devoured. At day break next morning they took a different course, came by Cumlungon castle and made their way home, where they found their families much alarmed on account of their absence. They said that they had seen a creature about the size of a dog, with two horns in its head, and cloven feet, roaring out like a lion, and if they had not galloped away, it would have torn them to pieces. One of their wives said, 'Hout man, it has been the Gudeman of the Brae's grumphy; it frightened them at the Blackshaw yesterday, and poor Mergie Anderson must lose her wits, and is ay out o' one fit into another sin syne.'

The pig happened to lie all night among the corn where the men were pulling thistles, and about day-break set forward on its journey for the Brae. One Gabriel Garion, mounted on a long tailed grey colt, with a load of white fish in a pair of creels swung over the beast, encountered the pig which went right among the horse's feet and gave a snort. The colt, being as much frightened as Gabriel, wheeled about and scampered off sneering, with his tail on his rizin, at full gallop. Gabriel cut the slings and dropt the creels, the colt soon dismounted his rider, and going like the wind, with his tail up, never stopped till he came to Barkirk point, where he took the Solway Frith and landed at Bowness, on the Cumberland side. As to Gabriel, by the time he got himself gathered up, the pig was within sight, he took to his heels, as the colt was quite gone, and reached Cumlungon wood in time to hide himself, where he staid all that day and night, and next morning got home almost exhausted. He told a dreadful story! The fright caused him to imagine the pig as big as a calf, having long horns, eyes like trenchers, and a back like a hedge hog. He lost his fish, the colt was got back, but never did more good, and as to Gabriel, he soon after fell into a consumption and departed this life about a year after.

About this time also a vessel came to Glencap quay, a little below Dumfries, that had some wine on board, most likely for the ship's use; one of them having got out of the vessel in the night, was seen on the farm of Newmains next morning. The alarm was spread, and a number of people collected. The animal got many different names, and at last it was concluded to be a brock. Some got pitchforks, some clubs, and others old swords, and a hot pursuit ensued; the chase lasted a considerable time, owing to the pursuers losing heart when near their prey and retreating; Robs Geordy, having rather a little more courage than the rest, ran 'neck or nothing' forcibly upon the animal, and run it through with a pitchfork, for which he got the name of 'stout hearted Geordy' all his life after. There is an old man, nearly a hundred years of age, still alive in the neighbourhood where this happened, who declares that he remembers the Gudeman of the Brae's pig, and the circumstances mentioned; and that he says it was the first swine ever seen in that country."

Almond and Mulberry Orchards have been set out in Alabama. The Olive Tree flourishes at Mobile. It is intended to raise Silk Worms.

Bleaching.—Amongst the various purposes to which steam has been applied, perhaps there is none that will be of greater advantage to the people of the United States, than the discovery recently made of its application to the purposes of bleaching linen and muslin. It will be of essential service to our infant manufactories. We have samples left at our office of thick linen drilling, which were bleached in the short space of ten hours, without the least injury to the fabric; and of cotton, which was bleached in a much less time.

We understand that a patent has been obtained for this improvement, and that a company are making application to the legislature to be incorporated with a capital of \$100,000, that its benefits may be tested by the community.

Albany Argus.

SAUER-KRAUT.

The following directions for making it, are given by Dr. Willich. In Pennsylvania it is a very fashionable dish among the Germans, and when prepared with neatness, is highly palatable, and especially when eaten with salt pork.

The soundest and most solid cabbages (the Red Dutch Cabbage is the best for this purpose) are selected, cut very small, put into a barrel in layers, about a hand high, over which is strewed a handful of salt and caraway seeds: in this manner, the layers are closely rammed down, one upon another, till the barrel is full, when a loose cover is put over it and pressed down with a heavy weight. After standing for some time, the mass begins to ferment; and as soon as it subsides, the head is fitted into the barrel, which is then finally closed, and its contents preserved for use. After being once opened, the *kraut* must be carefully compressed with a loose cover, and fresh salt and water every time substituted for that which is become foul, floats on the top, and should be removed. As this preparation has been found of considerable efficacy as an antiscorbutic, in long sea voyages, particularly those round the world, performed by Captain Cook, it deserves to be more generally known in this country (England): and though its flavour is far from being agreeable to those who taste it for the first time, yet we are convinced from experience, that it will soon be relished, even by delicate ladies, whose reason is superior to prejudice or custom. We could not recommend a more antiseptic and wholesome dish, especially if it be managed with care and strict attention to cleanliness.

A Spanish Botanist pretends that the soil of the south of Spain is suitable to all the shrubs and trees that grow in the whole world. The coffee tree vegetates abundantly, and produces a superior bean in the climate of Malaga. The mahogany and American cedar-tree, and the eucalyptus, a tree known at the Havana, bearing on account of its toughness, the name of quibra bacha, or ax-breaker—i. e. hardwood, is likewise successfully cultivated there.

The Bath Inquirer invites the attention of farmers in Maine to the cultivation of Hemp.

A tanner in the neighbourhood of Treves applies with success myrtle (*vaccinium myrtillus*) to the tanning of hides.

"Airy Sleep."—A patent has been granted in England for a newly invented *air bed, or mattress*. The ticking is formed of cotton cloth, with a coating of prepared gum elastic, and an outer covering of silk. It is so portable that it may be carried in the pocket, and may be filled and emptied at pleasure.

Hear this, ye sluggards, and rejoice. How convenient it will be, whenever the "drowsy fit is on ye," to take your bed out of your pocket, blow it up, and take a nap on your aerial couch, more soft than eider down. When the age of improvements will cease we cannot determine, but may soon expect to see a pipe of wine rendered portable as well as potable. Soon we may consider it no novel spectacle to see a traveller carrying his bed posts in a side pocket, as a carpenter does his square and compasses—a bed in his coat tail, and a bolster and pillows in his watch fob.—*Noah.*

SCIENTIFIC AGRICULTURE.

An Address delivered before the Hampshire, Franklin, and Hampden Agricultural Society; at Northampton, Oct. 24, 1827. By EDWARD HITCHCOCK, Professor of Chemistry and Natural History in Amherst College.

[Concluded from page 285.]

In order that such a journal should answer the purposes of agricultural experiment, it should embrace a great variety of particulars. It should give a daily account of the temperature of the air, according to the thermometer; and of its weight, according to the barometer. It should notice the direction, force, and changes of the wind; the state of the sky, whether clear or cloudy; the quantity of rain, hail, sleet and snow in each month; the number and relative severity of storms of lightning, and the moi- re of the atmosphere, as measured by appropriate instruments. That these circumstances have very great influence upon the growth of plants, the following paragraph from the writings of an able observer will show. "In the same tree he observed that in a cold cloudy morning, when no sap ascended, a sudden change was produced by a gleam of sunshine of half an hour; and a vigorous motion of the fluid. The alteration of the wind from south to north, immediately checked the effect. On the coming on of a cold afternoon, after a hot day, the sap that had been rising, began to fall. A warm shower and a sleet storm produced opposite effects."

Do these suggestions seem to any who hear me, to partake too much of mere philosophical speculation, and to be too refined, for the adoption of the practical farmer, even if he be an intelligent one? Far be it from me, gentlemen, to propose as your guides, mere philosophical conjecture, or abstract reasoning. So far as these suggestions are not based upon experience, let them be disregarded. But I would have this Society aim high. Agricultural experiments, imperfectly conducted, and partially detailed, are not wanted. Enough of them have been already made; and they have served only to fill up the records of husbandry with contradictory and perplexing results. And where can a Society be pointed out more favorably situated than this, for setting a better example; for bringing to this work minds versed in the principles, as well as hands skilled in the art, of husbandry? Think of the extent of territory, amount of population, embraced by this society. Consider too, that here is almost every variety of soil and situation on which to operate. Neither forget how widely industry and intelligence are diffused in this centre of New England. With such materials, ought this society to content itself with feeble and unmethodical efforts? How easy for it to take a high stand among kindred institutions, and to make its light shed over the land, and descend upon unborn generations?

And permit me here to say, gentlemen, that the objects you have in view are worthy of all the zeal, and effort, and perseverance, you may embark in the enterprise. These labours are not calculated to build up the fortunes of a few, upon the degradation and poverty of the many. They are not undermining the foundations of our free institutions, and paving the way for anarchy or despotism. On the other hand, they tend directly to elevate the character, and increase the happiness, of the great mass of the citizens: If pursued successfully, they will spread over these hills and valleys, an air of comfort, and independence, and intelligence, far superior to that they now

exhibit, with all their loveliness. By the blessing of Providence, this society has it in its power to double and to treble the present population of these counties without diminishing their enjoyment; so that the future traveller shall see our roughest mountains and glens smiling with cultivation and fertility. By giving a spur to industry, and fixing a stigma upon indolence, it will take away one of the grand sources of vice, ignorance and misery: so that an increase of numbers shall not be an increase of corruption. And while that increase will strengthen the arm of a virtuous ruler against foreign enemies, it will band together a firmer phalanx to resist the encroachments of designing men upon our liberties and rights.

The objects of this Society are likewise worthy of vigorous pursuit, on account of the personal enjoyment their prosecution affords. Earthly happiness is not a phantom; it has a positive existence, confused and disordered as the world is. And we all of us taste more or less of this happiness, as we are hurried along through life. True, it is not heavenly happiness in its kind; nor is it unmixed. The fountain has been poisoned and the streams flow out contaminated. Still we all thirst for the waters, and earnestly seek that region where they flow most pure and abundant. The ambitious monarch believes he shall find them by desolating the earth; and that every cup of happiness he dashes from the lips of others, will be poured into his own. But he soon finds that he has filled his cup with wormwood and gall. The warrior's heart beats high in anticipation of the pleasure he shall feel, when the battle and the wreath of glory are won. But he finds that he has mistaken a sea of blood for a sea of happiness. The youthful Statesman, as he rises from one station to another in the councils of his country, but faintly realizes how far away from the regions of happiness, the surges and the storms of public life are driving him. The man who strives for pre-eminence in the learned professions, knows not, till the desired elevation has been reached, how high it stands above, not merely the follies, but the enjoyments of life. And so in many other pursuits; when the charm of novelty has passed away, when time has cooled the passions, and possession has robbed the object of its false splendor, then it is found that the streams of happiness, like the streams of the desert, are almost dried up; leaving only their empty channels to mock desire. It is then that men begin to sigh for pursuits more calm, and peaceful, and retired. Hence it is, that so many, from the highest stations in life, have spent the evening of their days in the pursuits of agriculture; in the prosecution of experiments for increasing the produce of the soil. Here they found that contentment and satisfaction, which in vain they had sought, in the possession of power, and wealth, and reputation, and learning. For when all artificial pleasures have become insipid and even disgusting, rural scenes and pursuits have still the power to make new chords of happiness vibrate in the soul. We need not wonder then, that so many, after faithfully serving their God and generation, till exhausted nature demanded repose, have sought these scenes as a resting place from their toils; have landed on this peaceful shore, from the tempestuous voyage of public life. Says Washington, "I was summoned by my country, whose voice I can never hear but with veneration and love, from a retreat, which I had chosen with the fondest predilection, and, in

my flattering hopes, as the asylum of my declining years."

It is not therefore, a mere poetic dream, that invests agricultural scenes and pursuits with a peculiar charm. Imagination may here resign her pencil into the hands of experience, nor fear that the picture will want in vividness and interest.

Wool.—Mr. Mallary, of Vermont, [a wool-growing State] in his speech on the tariff bill, reported by the committee on manufactures, opposed the proposed additional duty on wool costing eight cents per pound and under. He said such wool was not and would not be produced in this country. The farmers of Vermont would not grow wool worth ten or twelve cents, when they could as well produce that which may be worth forty or fifty cents. This coarse imported wool is made into negro cloths, and inferior baizes and flannels. The manufacture of it is established, and ought not to be driven from the country and given to foreigners. The proposed duty would amount to more than one hundred per cent, and would ruin the manufacturer of coarse fabrics at a blow, without benefitting the farmer. If the latter should raise wool worth eight or twelve cents, he could not find a market for it. He was also opposed to the other provisions of the bill respecting wool and woollens. The charge on wool was too high, or that on woollens was not high enough; and this disproportion would inevitably ruin the manufacturer, and with him the wool grower. If the former could not purchase the wool of the latter, it would be in vain to produce it. The markets of Europe are full of wool, and prices are very low. The English wool growers are petitioning parliament for a duty on foreign wool, but their petitions will not be granted. The English woollen manufacturers will receive every encouragement, and will be able to sell their goods at the lowest rate possible, so long as there is a prospect that they can break down the American manufacturers. Should they succeed in accomplishing that object, they will then raise their prices and we must pay them.—*Hampshire Gazette.*

Growth of Silk.—It appears that the East India Company are likely to prove perfectly successful in their attempt to form a profitable establishment in the island of St. Helena, for the production of raw silk. A specimen has recently arrived from that island, and it is considered to be a very fine quality. It is entirely free from any disagreeable odour, which speaks much in its favor. The mulberry trees thrive remarkably well, and have a luxuriant appearance. The slips, when planted, are generally from one to two feet in length, and in a single season they frequently attain a greater height than ten feet. The climate and soil, however disagreeable and fruitless in other respects, seem in this instance to be propitious; no doubt is entertained that sufficient food will be procured to supply all the worms that can be hatched. In August last, the number of worms in progress, was 218,000; which were in a very healthy condition, and expected to spin in a few days. By the common process of nature, the worms would multiply with great rapidity; but it appears that artificial means, to accelerate the quickening of the insects may be advantageously had recourse to. The experiment has been tried, and it is proved that by steeping the eggs in water, heated to a certain degree, they can be hatched at any period.—*New Monthly Magazine.*

The formation of a new territorial government west of Lake Huron or the territory of Michigan, is contemplated. Michigan will soon claim admission in the union as an independent State. The increase of this republic in wealth and population is unparalleled. In a few years, at least three more States will be added to the confederacy—Michigan, Arkansas, and Florida. And west of the two former, new territorial governments will necessarily be established. So we are destined to progress, until the whole country between this point and the mouth of Columbia river will be divided into States, and subject to the dominion of civilized man.—*Kentucky paper.*

Cornish copper mines—In the parish of Gwennap alone, the copper ores sold in the last seven years amount to £1,929,000. The last year the amount was upwards of £37,000—besides what was received for tin, fluor-spar, &c. and which may be estimated at £50,000 more.

Mode of keeping apples—It seems not to be generally known, that apples may be kept the whole year round, by being immersed in corn. If the American apples were packed among grain, they would arrive here in much finer condition. In Portugal it is customary to have a small ledge in every apartment, (immediately under the cornice) barely wide enough to hold an apple; in this way the ceilings are fringed with fruit, which are not easily got at without a ladder; while one glance of the eye will show if any deprecations have been committed.—*Lon. Quart. Jour.*

New potatoes were brought into this market and sold, (says the Pennsylvania Gazette of the 22d of March,) two or three days ago. We have before us a dozen, all about the size of walnuts. They were raised in Jersey, three miles from this city, in the open ground, in the ordinary way, without artificial heat or forcing. Shad, also, are abundant, at 3½ cents each.

Improvement in stock—Mr. Erasmus Harris, of Chesterfield, has raised a bull calf, which on the 6th inst. (at the age of one year) weighed, alive, seven hundred and thirty-two pounds.

Dog Mill—An ingenious Mechanic—Mr. Mathias, of this city, has in operation in King-street, a Mill for sawing timber for Sashes and Window-Blinds, driven not by steam power nor water, nor cattle power, but by *Dog power*. Four dogs belong to the establishment. They are worked two at a time, for about fifteen minutes, when the *team* is taken off, and a relay of the two other dogs put to labour. They travel on the circumference of the *inside* of a wheel about 12 or 15 feet in diameter, which gives motion to the machinery which drives a circular saw with great velocity. It requires some days and some art to *break a dog in*. It is really amusing to observe the sagacity of these animals. They are taught a practical lesson that, industry is necessary to animal welfare. The cost of keeping four dogs is estimated at only 6d. per day.—*Troy Sent.*

Essex Beef—A yoke of oxen seven years old, from West Newbury, were slaughtered at Newburyport last week, and sold at seven dollars per hundred. The nett weight of one was 1509 lbs. The other, 1571 lbs. and each had upwards of 180 lbs. of tallow.

Potatos—Mr. Wm. Wilson states in the New York Farmer, as the result of twenty years' experience, that the driest and best flavored potatoes, and the most abundant in crops, are produced on strong heavy loams. He tried seven years to raise them on sandy soil, but did not succeed; the drier the season, the more soft and watery was the produce of the sandy soil.

Cost of iron in Europe—Russia old sable iron costs from 57 to \$62 per ton—the freight is \$10 the duty \$18, and it sells from 95 to \$100 per ton. Swedes iron costs \$57 per ton—the freight is \$7, the duty \$18, and it sells from 94 to \$98 per ton. Rolled iron costs in England \$44 per ton—the freight is \$3, the duty \$30, and it sells at about \$82 per ton. The annual consumption of iron in the United States is 97,000 tons—and of this, 29,635 tons are imported.

Teazels are becoming quite an article of trade. A single woollen factory, in the flourishing and active manufacturing village of Sommersworth, N. H. which consumes annually 109,000 lbs of wool, uses 900,000 teazels a year, worth, at \$3 a thou, and \$2,700.

The Mercer Potato—The best of all roots of the potato kind, called by this name, is the production of a neighboring State. It has been a question among our farmers for many years, whether it was produced by an improved mode of raising them, or whether it was a foreigner. We are at length enabled to settle this question, by the assistance of a kind friend. He says the species of potato called Mercer, was originally raised in Mercer county, Penn. by a gentleman of the name of Gilbey, and are there called Nophannocks, from the name of a creek which passes through that county. About twenty years since, this gentleman planted the *apple*, or ball of a potato, from which has sprung this delightful root.—*Dela. Adv.*

Good Beef—Mr. Artemas Lawrence, of Jaffrey, N. H. has raised, and lately butchered a cow and her calf, weighing as follows: The cow, 9 years old, hide, 106—tallow, 155—quarters, 995—total, 1256 pounds. The heifer, 30 months old, hide, 104—tallow, 56—quarters, 677—total, 877 lbs.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 4, 1828.

POTATOS.

(Concluded from page 286.)

Soil. "The soil," says Loudon, "in which the potato thrives best is a light loam, neither too dry nor too moist, but if rich so much the better.—They may, however, be grown well on many other sorts of land, especially those of the mossy, moory, and other similar kinds, where they are free from stagnant moisture. The best flavored potatoes are almost always produced from a newly broken-up pasture ground not manured; or from any new soil, as the site of a grubbed-up copse or hedge, or the site of old buildings or roads. The best climate for the potato, is one rather moist than dry—and temperate or cool rather than hot.—Hence the excellence of the Irish potatoes, which grow in a dry loamy, calcareous soil, and moist and temperate climate; and hence, also, the inferiority of the potatoes of France, Spain, Italy, and even Germany. In short, the potato is grown no

where in the world to the same degree of perfection as in Ireland and Lancashire, and not even in the South of England, so well as in Scotland and the north and western counties; all which is, in our opinion clearly attributable to the climate."

Although a *light loam* is a proper soil for the potato in a cool and moist climate, a strong and heavy loam is not suitable for the same root in a dry and hot climate. In a paper read before the New York Horticultural Society, in 1823, by Wm. Wilson, an experienced horticulturist, are the following remarks on this subject: "Those soils, which prove the very bane of the potato here [in the United States] are just such as prove the most congenial for them in Britain. And so on the contrary, the best soils, by far for producing the driest and best flavored potatoes here, and altogether the most abundant crops are those of a strong heavy loam." These assertions are corroborated by a number of experiments, mentioned in the paper from which they are extracted. Mr. Ducl of Albany, likewise asserts, that "the best potatoes, are grown upon cold, moist, but porous and rich soils."

Methods of Planting. These are various. If the land is rough, hard, or strong, the common mode of planting in hills is, perhaps, the most expeditious. But if it be somewhat mellow, drills are to be preferred. Dr. Cooper says, "if your soil is stiff and wet, plough it in ridges; if sandy and dry, plough it flat. Plough it deep. Plant your sets in drills marked out by the plough or the bar. The plants should be dibbled in, six inches deep, on long dung, scattered not sparingly, along the drills—then covered with about four inches of mould.

The drills should be in threes \equiv one foot apart; the plants should be eight inches apart, with an interval, on each side of each set of three drills, of two feet, which will admit of horse hoeing between the sets of drills, and of hand weeding between each drill,

To have a good crop, you must not spare dung, or spare labor in weeding. Some persons prefer sets of four or five drills instead of three; or where horse-hoeing is not convenient, the intervals may be reduced to one foot between each set of drills for the convenience of hand weeding; but upon the whole, the method here first proposed is as good as any. Forty loads of dung per acre will pay better than a less quantity.

If small potatoes are wanted for feeding, the sets may be at six inches apart, and the rows at nine inches; but the method first here proposed, admits what is essential, accurate weeding, and sufficient air to circulate between the plants."

Dean says the sets may be either in single rows, three feet or double, one foot apart, and from seven to nine inches asunder in the rows.

An expeditious way of planting potatoes, is as follows: After the ground is prepared, by ploughing and harrowing, cut furrows with the horse plough, forty inches apart, drop the sets in the furrows; then pass the plough along the back of each furrow, which will throw the earth of both furrows upon the sets; and afterwards level the ground with the back of the harrow, or with a harrow that has short tines; but it is of no great consequence whether it be leveled at all. Another

or method of planting, is to plough the ground plain, keeping the furrows straight and regular and drop sets in every third or fourth furrow.— But before this is done the ground should be ploughed and made level and fine with the harrow.

A writer for the *New England Farmer*, Vol. ii. page 331, gives the following as “an easy and cheap method of raising potatoes. On an even and smooth piece of mowing, or pasture land, make deep single furrows with a plough at three feet distance. Fill these furrows with rye [or any other] straw, and drop your potatoes six or eight inches apart on the straw. Then with a hoe, cover the potatoes by turning down the ploughed furrows upon them. They will require no more attention till they are grown. No hoeing will be necessary. The same land may be improved as a pasture for sheep—as those animals will not eat, nor materially injure the tops of the potatoes.”

The after-culture of potatoes consists in harrowing, hoeing, weeding, and earthing-up. All potatoes require to be earthed-up; that is to have at least one inch in depth of earth heaped on their roots, and extending six or eight inches round their stem. The reason is, that the tubers do not, properly speaking, grow under the soil, but rather on, or just partially bedded in its surface. Potatoes should, generally, be hoed three times, though twice will do in ground not infested with weeds. The last hoeing should be finished before the plants are in blossom; otherwise the plants will be apt to form a second set of roots, which will not have time to come to maturity, but will rob those first formed of their nourishment. If weeds are prevalent, they should be cut up or pulled out, but the plants should not be earthed-up in that stage of their growth. Plaster of Paris, well pulverized and applied to the leaves, has a beneficial effect on potatoes.

Pinching off the blossoms. It is now generally admitted, that a certain advantage in point of produce, is obtained by pinching off the blossoms as they appear on the plants. The fact has been repeatedly proved, and satisfactorily accounted for, by Knight, who imagines that it will add an ounce in weight to the tubers of each plant, or considerably above a ton per acre.

Gathering the crop. It is believed that cultivators are apt to err by gathering their potatoes too early. The roots continue to grow larger and better after the tops have attained their full growth. The Hon. O. Fiske, of Worcester, in an address to the Worcester Agricultural Society, says “nature has not accomplished its maturation at the period when the vines decay, and the farmer believes it to be ripe. It seems probable that the earth by some unknown process, perfects its qualities after it has attained its growth. That potatoes, which have remained the whole season in the earth are more farinaceous, has been ascertained.” It may be stated as a general rule, that potatoes succeed best when planted early and dug late.— But it is most advisable to harvest them before the occurrence of those soaking rains which, generally precede the setting in of winter.

A mode of taking part of a crop, is mentioned. “Having ascertained that some of the tubers have attained an eatable size, go along the rows and loosen the earth about each plant with a blunt stick, taking two or three of the largest tubers from each, and returning the earth carefully.”

The most expeditious way of gathering a potato

crop, is, first to run furrows on each side of the rows, and then a deep one in the middle, which turns up most of the roots to the surface for the purpose of picking up by hand. In this way, however, we should apprehend some waste, and should not advise it except where potatoes are plenty and labor scarce. A hoe with prongs, such as is sold at J. R. Newell's Agricultural Establishment, 52, North Market street, is, probably, the best implement for gathering potatoes.

Securing the crop. Mr. Bucl, of Albany, says, “there are many erroneous notions in regard to the culture and treatment of the potato, which every class in society have an interest in exploding, as the root has become a necessary food for every family.” These errors consist in supposing—1st. That potatoes should be grown on a dry warm soil. 2d. That they should be dried in the sun, or washed, to render them pleasant to the eye. 3d. That they should be kept warm and dry during winter, to fit them for culinary uses. 4th. That they should be of large size. In contradiction to these popular opinions, he asserts. “First, that the best potatoes are grown upon cold, moist, but porous and rich soils. Second, that it were better the sun never should shine upon them—that they should be housed with all the dirt that adheres to them—that it is beneficial to add more in the bin or cask, to exclude external air as much as possible. And, third, that their surface should be kept moist, and the atmosphere which surrounds, as little above the point of keeping as possible.”

Potatoes may be kept during winter in a cellar, free from frost, or in pits or caves in the field. In the latter case, they must be so situated on a dry knoll, or the side of a hill, as to be secured from the possibility of the pits being pervaded by water; and they must be so covered, first with straw and then with loam, as to prevent the intrusion of frost. They may, likewise, be placed in barrels, casks, or boxes, and if packed in moist sand, or the loam of the field in which they grew, they will be preserved better than in almost any other situation. If they are exposed to the sun and air till the upper side acquires a green color, they become poisonous.

Use. The use of the potato as an article of diet both for man and beast, is, probably, more extensive, and more common, than that of any other vegetable production. From having no peculiarity of taste, and consisting chiefly of starch, it approaches near to the qualities of the flour of grain; “and for this reason,” says Loudon, “it is the most universally liked, and can be used longer in constant succession by the same individual without becoming unpalatable, than any other vegetable, the seeds of grasses excepted.” Neill observes, that “so generally is it relished, and so nutritious is it accounted, that on many tables it now appears almost every day in the year.”

An Essay on the Solanum Tuberosum, by H. C. Worsham, from the Philadelphia Journal of the Medical and Physical Sciences, gives the following summary view of the excellent qualities of this superlative root: “Having its origin in a warm climate, it was supposed to be intolerant of cold, and upon that account incapable of cultivation in a more northern clime. But experience has shewn the contrary, and the potato is naturalized almost in every region. With the lower classes of people it is one of the greatest blessings, which the soil produces, forming flour without a mill, and bread without an oven; and at all seasons of the

year an agreeable, wholesome dish, without expensive condiments. What resources does the potato present to us? Its stalk, considered as a textile plant, furnishes in Austria a sort of flax—when burned it yields much potash—its apples, when ripe and crushed, ferment and give spirits by distillation—its tubercles made into a pulp are a substitute for soap in bleaching. Cooked by steam, the potato is a most healthy food. By different manipulations it furnishes two kinds of flour a gruel and a parenchyma, which may be applied to increase the bulk of bread made from grain. Treated chemically it is converted into beer, vinegar, spirits, &c.”

Castor Beans.—An Illinois paper calls the attention of farmers to the cultivation of this article. The few experiments made in rearing this plant, prove that the manufacture of Castor Oil may become a source of vast profit to the western country at least, as an article of exportation.

Mr. John Adams of Edwardsville has commenced the pressing of oil from them. For the present he uses his cloth press for that purpose, and obtains seven quarts of cold-pressed oil from a bushel of beans. He presses them without either grinding or pounding.

[From the *New York Farmer*.]

Strawberries.—In 1825 I received twelve varieties from the London Horticultural Society, eight of which grow. The *Downton*, a new variety produced by Knight, by artificial crossing, yielded some berries measuring 4 3/4 inches in circumference. The *Methaven Scarlet*, several of which measured four inches. They are both good bearers.

Potatos for Seed.—It seems to be a received opinion among the horticulturists of Great Britain, that Professor Schoen's rule as to grain, should be reversed in regard to this root—that *these must be gathered in an unripe state for seed, and fully matured for the table.* It also appears from numerous experiments, that the upper or seed end of the tuber will produce roots a fortnight earlier than the lower end, connected with the runner. From the same variety of seed four successive crops may be obtained, at intervals of two weeks, the seed being planted at the same time and on similar soil, viz: the first from the upper set of the unripe seed; the second from the bottom set of the same; the third from the top end of the ripe seed; and the fourth from the bottom set of the same.

Thrice Blooming Apple.—In the 6th vol. of the London Horticultural transactions, is a communication from M. Thouin, giving an account of the *Cultrille Rouge de Micoud*, an apple which affords three sets of blossoms and fruit in a season. The blossoms appear in April, June and August. The first crop of fruit ripens in August; the second crop immediately succeeds, and lasts till the last of October; the third are picked after frost, and ripen in the fruit room.

Scotch exports.—At a dinner of the Caledonian Horticultural Society, in September, the Earl of Roxburg presiding, the following was given as a leading toast: “The staple exports of Scotland, Gardeners, Doctors, and [other] Black Cattle.”—*Cal. Mer. Sept. 8.*

“Jack, which is the way to Epping?” “How do you know my name is Jack?” “I guess it.” “Then guess your way to Epping.”

Valuable Farm for sale at Auction

The Subscribers, by order of the Probate Court for the district of Windsor, will sell at auction to the highest bidder, at the dwelling house of Mrs. Jemima Hicks, on the 10th day of April next, that valuable Farm, late the property of Mr. David Hicks, deceased, situated on the main road from Windsor to Weatfield, consisting of about 330 acres—100 acres of which is rich merrable, lying on unincumbered tract, and in a good state of cultivation; and the remainder consists of upland, tillage, pasture, and woodland, of a very excellent soil, on which is considerable pine timber. On the premises is a dwelling house and watered. Also, will be sold at the same time and place above mentioned, about 70 acres of woodland, adjoining the above farm. Likewise, all the personal property of the said deceased, which remains unsold, consisting of various articles of household furniture, farming tools, stock, &c. Sale to commence at 10 o'clock A. M.—Terms made known at the time and place of sale.

DAVID ESTY } Administrators.

Weathersfield, Vt. March 19, 1838.

Grafting and Garden Work.

RUFUS HOWE, of Dorchester, informs his friends and the public, that he will attend to the Engrafting of Trees or Garden work. Having had considerable experience, he thinks he can give satisfaction to those who may favor him with their orders. Reference can be had of Mr. Samuel Downer, of Dorchester.

30 March 4

Marrowfat Peas.

For sale, a consignment from Albany, of 50 barrels Marrowfat Peas, by the barrel, at a very low price.—Inquire at the Seed Establishment, No. 52, North Market street.

Horse Wanted.

A gentleman who is located in a section of Massachusetts where there are many desirous of raising colts, wishes to hire for the season, a half blood or good framed Stallion, or if the owner prefer, would board the horse (and a groom if desired) at a very low rate.—Enquire at this office. March 29.

Farmer Wanted.

A young farmer with his wife, is wanted, to take charge of a farm about 10 miles from New Haven. A young Massachusetts farmer who thoroughly understands his business, and whose wife is acquainted with the management of a dairy, and who can furnish testimony of economy, neatness, and industry, will have an opportunity to make a permanent and advantageous bargain. Inquire at the New England Farmer Office.

New York, March 21, 1838.

Isabella Grape.

Vines of the ISABELLA GRAPE may be had, on application to the Subscriber, in Dorchester, or at his office, 71 1/2 Congress Street. ZEB COOK, Jr.

Wanted as above, a first rate Gardener, who can produce satisfactory recommendations. March 21.

Milk Carriage.

For sale, a new Milk Carriage—inquire of Walter Frost, No. 13 Common street, Boston. March 21.

Landrett's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to their Nurseries, as offering peculiar facilities for the procurement of useful and ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated in this country. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons parlors, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making. In the portion of ground allotted to Garden Seeds are grown almost every variety of European Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in sowing—in short, the whole process of cultivation in gathering &c. all being under their own personal superintendence unobscuredly conspires in an eminent degree, to obviate the errors and disappointments in a department of commerce on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15. D. & C. LANDRETH.

SUPERB BULBOUS ROOTS.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbous Roots, suitable for spring planting. Consisting of black, purple, orange, violet, crimson, rose, madder, amaranth, and white colored DOUBLE MEXICAN DILLIAS. Also, Ferraria Tigrida, or Mexican Tree Flower—Amaryllis Formosissima, or Jacobean Lily—Double Tuberosa and Ranunculus; paintings of which may be seen at this place. The above collection of bulbs is in fine order, and is from the same House from which we obtained the Bulbous Roots last autumn, which gave such uncommon satisfaction.

Just received direct from Glasgow Scotland, a large collection of SCOTCH GOOSE-FERRY BUSHES, of the largest and finest fruit, done up in bundles of five roots each with the name marked—price 1.50 per bundle. Specimens of the fruit, preserved, measuring four inches in circumference, may be seen at this place.

A supply of the Roots of WILMOT'S SUPERB STRAWBERRY—measuring six and eight inches in circumference, is daily exported from Europe.

At this place is kept a large variety of Ornamental Flower Seeds, (of 300 different sorts) in papers of 6 cents each, or \$5 per hundred assorted; the names of which it is of course impracticable to give here. The collection comprises many French, Swiss, and Oriental plants, ones introduced by Nutall, from Missouri, and the Rocky Mountains.

A few barrels of superior Early Manly Potatoes, have been received. This is the same sort as those sold at this place last year, which gave universal satisfaction, as to uncommon earliness, and good quality.

Also, seeds of the Cuba Tobacco, Yellow Flacco, Teazel, Leucht, Spring Wheat, Spring Rye, Barley, Rape, Corn, Spring Vetches, Castor Oil Bean, Corn, (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Burnet, Orchard Grass, Rye Grass, Tall Meadow Oats Grass, White and Red Clover, Mangel Wurtzel, &c.

N. DAVENPORT offers for sale at his Nursery in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Pears, Peaches, Prunes, Nectarines, &c. Gooseberry and Currant Bushes. —A list of which can be seen in office of the New England Farmer, or Agricultural Warehouse—and will be inserted in the New England Farmer occasionally. At this Nursery, however, it is not so much an object to present the imposing display of a great number of the names of different fruits, as to keep a choice collection of those sorts, whose excellence is well known and established.

Orders are respectfully solicited, and will receive prompt attention if left with J. R. NEWELL, at the Agricultural Establishment, No. 52 North Market street; or with FRENCH & DAVENPORT, No. 713 Washington Street—or at the Nursery in Milton.

Rose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 80 hundred leaf Rose bushes—90 do. Province, or Cabbage 10 do. four seasons—30 do. Damask—30 do. Burgundy—5 do. Austrian—25 do. Marble—10 do. Tuscany—100 do. French—6 very large pots monthly roses, sixteen years old, and in prime health—7 do. double Damask—5 do. single—5 do. single—200 India, or Grape Myrtle, two of which are 20 years old—200 Grape Vines, (White Sweet water)—Snow ball Bushes—White Lilies—Red and White Lilacs.

ROSE WATER.

20 Demijohns Double and Single distilled Rose Water, made entirely from Damask Roses. The above Rose Water is constantly kept for sale at Mr. C. Wadell's Porter Cellar, No. 12 Merchant's Row, by Demijohn or less quantity.

6t March 14

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long Island, near New York.

In behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who may be desirous of stocking their gardens and fields with Fruit Trees of the finest sorts, and most healthy and vigorous stocks the present season. *Bloodgood & Co. attend personally to the forwarding and Engrafting of all their Fruit Trees—and purchasers may rely with confidence, that the Trees they order will prove genuine.* The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS.

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him.

The reputation of this Nursery is so extensively known, and has been so well sustained, that I take leave to refer those in want of Trees, to one of the Horticulturists in this City and its vicinity; and if equal demonstration is desired, I invite those who wish to be thus satisfied to examine the Trees in my garden at Dorchester, procured from this Nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis, on application to ZEB COOK, Jr. Rogers' Buildings—Congress St.

Gunpowder, &c.

Do Pont's Gun Powder, at 23 to 50 cts per pound—Shot—Balls—Flints and Percussion Caps. Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Gunpowder Store, No. 65 Broad Street—By E. COPPELAND, Jr.* The Do Pont sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. March 11.

Fruit and Ornamental Trees.

The KENRICK NURSERIES in Newton, near Boston, are the most extensive in New England. Gentlemen in want of Trees, are invited to call and examine for themselves—and, make their own selections. The Apple and Peach Trees are extraordinary for size, variety, and fruitiness.

Written orders addressed to JOHN or WM. KENRICK, and sent to the Newton Post office, or left with Joseph Bridge, agent, in Court-street, where Catalogues may be had gratis, will be carefully attended to. Trees will be suitably packed for shipping or land conveyance, and delivered in Boston when desired. Gentlemen living at a distance, however, should have agents in the city to receive and pay for them. Mar. 14.

Garden Seeds.

The subscriber has for sale a very large assortment of fresh and genuine Garden Seeds, from the New England Farmer Seed Establishment, Boston. Likewise, a few pounds Lucerne Seed. Newburyport, March 21. E. STEDMAN.

40,000.

For sale, Forty Thousand engraved APPLE TREES, from two to four years from the graft—consisting of forty-three kinds of the most approved and superior Fruits, including early autumn and winter Apples. Also, other Fruit and Ornamental Trees. Orders may be sent to this place via Post office, directed to FRANCIS WINSHIP. Brighton, March 21st, 1838.

MISCELLANIES.

The following lines, (enclosing a ring) were addressed by Lord Lyttleton to his wife, fourteen years after marriage.

Thy, Mary, with this ring I wed;
So fourteen years ago I said.
Behold another ring! For what?
To wed thee o'er again; why not?

With that first ring I wedded youth,
Grace, beauty, tin, conceit, and truth;
Taste long admired, sense long revered.
Ah! all my Mary then appeared.

If she by merit since disclosed
Prove twice the woman I supposed.
I plead that double merit now,
To justify a double vow.

Here then to day, with faith as sure,
With ardor as intense and pure,
As when amidst the rights divine,
I took thy truth and pledged mine.

To thee, sweet girl, this second ring,
A token and a pledge I bring
With this I wed, till death us part,
Thy ripper virtues to my heart;

Those virtues which, before untried,
The wife has added to the bride—
Those virtues, whose progressive claim
Endearing wedlock's every name.

My soul enjoys, my song approves,
For conscience' sake, as well as love's—
For why? they show me hour by hour,
Honor's high thought, affection's power—
Discern the deed, some judgment's sentence,
And teach me all things—but reputation.

Old Bailey wit.—A man tried for stealing a pair of boots from a shop door in Holborn, with which he ran away. (*Judge, to the witness who had pursued and seized the prisoner*)

Judge.—What did he say, when you caught him?

Witness.—My Lord, he said that he took the boots in joke.

Judge.—Pray how far did he carry the joke?

Witness.—About forty yards, please your Lordship.

An Irishman who was employed on the canal last spring, was observed one day attentively watching a red headed wood-pecker, while it was tapping a beech tree. On being asked what attracted his attention, he said, "I'm speering at the strange baste upon yonder tree—for sure enough the silly crathur has knocked his face against it till his head is a gore of bluid."

Grese.—One of these birds was hatching on a hill in our neighbourhood during the late snow storm. The winds blew and the snow descended and drifted around her but she hung on like the tooth ache. And it was not until every part and parcel of her was covered except her head that the benefit of a removal occurred to her. She then "rose, reported progress," and we believe has had "leave to sit again."—*Tavunon Id.*

Appropos Paula singing.—Many years ago, in "old Continental times," an obscure parish, in a corner of the town of W—, in Connecticut, set about the erection of a house of public worship.—As not unrequently occurs on such occasions, a disagreement took place about the location of the

house; which, after the frame was raised grew to such a height, that the work was stopped; and the uncovered frame stood for years exposed to the elements, until it literally tumbled down. An attempt was then made to rebuild the house—a new frame was provided for the purpose—and the "society" gathered together for the raising. Among those present, was the late Dr. Lemuel Hopkins, of witty memory, (then a boy) together with his father, the clergyman of the adjoining parish.

As was customary in those times, it was proposed to have prayers and singing before the "raising" commenced—but there was no Psalm Book there. Young Hopkins, however, suggested that he could remember a Psalm, and was accordingly requested to give it out, in the old way, by "lining it." He therefore began—

"Except the Lord doth build the house,
The builders work in vain.

These being duly sung to the good old tune of *Mear*—he continued,

"Except the Lord doth finish it,
'Twill tumble down agan."

We have now before us a better school-slate than we ever saw before. It is of sufficient thickness and polish, of a fine grain and of a dark colour.—This slate is from the quarry of *J. M. Porter*, near Easton. He has an immense number ready for market, and will sell them as cheap as the imported article. Its manufacture will give employment to some hundred of our citizens.—*Phila. Press.*

A discovery has recently been made at Albany, it is said, to bleach linen and muslin by steam.—Thick linen drilling has been bleached in ten hours, without injury to the fabric, and cotton in much less time. It has been patented.

Conveyance of Sound.—The wide spread sail of a ship, rendered concave by a gentle breeze, is also a good collector of sound. It happened once on board a ship sailing along the coast of Brazil, 100 miles from land, that the persons walking on deck when passing a particular spot, always heard most distinctly the sound of bells; varying as in human rejoicings. All on board listened and were convinced, but the phenomenon was mysterious and inexplicable. Months afterwards, by comparing notes, it was ascertained, that at the time of observation, the bells of the city of St. Salvador, on the Brazilian coast, had been ringing on the occasion of a festival; the sound, therefore, favored by a gentle wind, had travelled over 100 miles of smooth water, and had been brought to a focus by the sail in the particular situation on the deck where it was listened to. It appears from this that a machine might be constructed having the same relation to sound that a telescope has to light.

Cochineal.—The Washington papers, of last week, contained a valuable article on the subject of cultivating Cochineal, in the United States.—The late English publications state, that it has succeeded in Europe. The common opinion that these insects fly from leaf to leaf to deposit their eggs, is not correct. The male insects only fly. They are few one or two to every thousand females. These insects feed upon the prickly pear, which is indigenous in the Southern States.—Hence it is inferred, that the Cochineal may be cultivated, very profitably in this country. Its price is about three dollars per pound. The experiment certainly should be attempted.

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—and the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

<i>Achille</i> , Green Globe	<i>Melon</i> , Pine Apple
<i>Asparagus</i> , Devonshire	Green Curoon
Gravesead	Persian
Battersca	Nutmeg
Large white Reading	Large Calatoupe
(20 varieties) including the English broad beans, dwarfs and pole.	Homogranate, or Mash
<i>Beets</i> , true Long Blood	Carolina Water
Early blood Turnip	Long Island Water
Early White Scarcity	Apple seeded, Water
French Sugar, or Amber	<i>Marjoram</i> ,
Orange	<i>Mustard</i> , White and Brown
Green, (for soups, &c.)	<i>Nasturtium</i>
<i>Borax</i>	<i>Mongol</i> Wurtzel,
<i>Brocoli</i> , Early White	<i>Onion</i> , Potatoe
Early Purple	Tree
Large Cape	White Portugal
<i>Brussels Sprouts</i> ,	Yellow
<i>Cabbage</i> , Early Salubary dwarf	Madeira
Early York	Strawberg
Early Dutch	Large Red
Early Sugarloaf	<i>Parsley</i> , Siberian
Early Lon. Battersca	Dwarf Curled
Early Emperor	Curled, or Double
Early Wellington	<i>Parsnip</i> , Large Dutch swelling
Large Bergen, &c.	Silver skinned
Large Cape Savoy	Early Washington
Large Scotch	Early double blossomed
Large Green glazed	Early Fane
Large late Dromhead	Early Golden Hotspur
Tree, or 1800 headed	Early Charlton
Green Globe Savoy	Early Strawberry Dwarf
Red Dutch	Dwarf Blue Imperial
Yellow Savoy	Dwarf blue Frussian
Turnip, rootcd, &c	Dwarf Spanish, or Fan
Russian	Dwarf Marrowfat
Late Imperial	Dwarf Sugar
Late Sugarloaf	Matchless, or Tall Mar.
<i>Cardoon</i>	Knight's Tall Marrows
<i>Carrots</i> , Altringham	Tall Crooked pod Sugar
Early Horn	<i>Peppers</i> , Long, or Cayenne
Blood Red (for West India market)	Tomato, or Squash
Lemon	Bell
Long Orange	Cherry
Cremor	<i>Pumpkins</i> , Finest Family
<i>Conflower</i> , Early and Late	Conocretic Field
<i>Celery</i> , White solid	Mannoth
Rose coloured solid	<i>Radish</i> , Early Frame
Italian	Short pot Scarlet
Celeriac, or turnip rooted	Long Salmon
<i>Cherrie</i>	Purple Short Top
<i>Chives</i>	Long white, or Naples
<i>Corn Salad</i> , or Venetost	Cherry
<i>Cress</i> , Curled, or Peppercress	Violet colored, or
Broad leaved or Garden	White Turnip Rooted
Water	Black Fall, or Spanish
Long Orange	<i>Rhubarb</i> , for tarts, &c.
<i>Cucumber</i> , Early Frame	<i>Ruta</i> Baga,
Green Cluster	Salisbury, or vegetable oyster
Short Prickly	<i>Sea Kale</i> ,
Long Prickly	<i>Silver</i>
Long green Turkey	<i>Scorzonera</i>
Long white Turkey	<i>Saffron</i> ,
White Spined	<i>Spinach</i> , New Zealand
Small Girkm, &c.	Prickly, or Fall
<i>Egg Plant</i> , Purple	Round leaved summer
White	Eng. Patience Dock
<i>Endive</i> , Green	<i>Sage</i> ,
White Curled	<i>Squash</i> , Early bush Summer
Broad leaved Batavian	Long Crook Neck
<i>Garden Broom</i>	Vegetable Marrow
<i>Garlic</i> Sots	Porter's Valparaiso
<i>Indian Corn</i> , (several varieties)	Acorn
<i>Kale</i> , Sea	<i>Tomatos</i>
Purple curled	<i>Turnip</i> , Early White Dutch
Green curly Scotch	Early Garden Stoue
<i>Leek</i> , London	White Flat, or Globe
Large Scotch	Green Long
<i>Lettuce</i> , Early Curled Silesia	Red Round
Large Green head	Swan's Egg
Royal Cape	Large Eng. Norfolk
Imperial	Long Tankard
Hardy Green	Long Yellow French
Brown Dutch	Yellow Dutch
Grand Athural	Yellow Maltese
Tennisball, or Rose	Yellow Aberdeen
Dromhead	Yellow Stone
Magnan Bonum Cuss	Yellow Swedish
Black Cross	Deulam
De Cuss	<i>Thyme</i> —Sweet Basil—Bonest,
White Cuss, or Leaf,	<i>Watercress</i> —Rivemary—Hyssop,
Green Cuss	<i>Wormwood</i> —Nutmeg—Sage,
	<i>Penny-rub</i> —Spickard—Dill,
	<i>Balm</i> —Tansy—Bene, &c.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VI.

BOSTON, FRIDAY, APRIL 11, 1828.

No. 38.

AGRICULTURE.

(From the American Farmer.)

ON THE

EFFECTS OF THE PROTECTING SYSTEM

Upon the Agricultural Interests.

Boston, near Boston, 15th Feb. 1822.

To JOHN S. SKINNER, Esq.

Dear Sir,—By an editorial article in a late American Farmer, (No. 42,) we learn that you are in a *quandary* on the tariff question, that you saw the system of 1821 established, and in 1822, the farming interest more depressed than you ever knew it. Every friend to his country, who has witnessed your zealous and untiring exertions to promote its best interests, will, from motives of gratitude, feel disposed to lend a helping hand to relieve you; thus actuated, I proffer my feeble aid.

I shall commence with an expression of my deliberate opinion, that a *mania* with regard to the question at issue, has been somewhat *rife* in our country for several years past; and, as in the *physical* system, when an *epidemic* prevails, the *robust* are often its victims, while the *feeble* escape, so in the *intellectual*, when a *mania* rages, it not unfrequently passes by the *weak* and *puny*, and seizes upon the *wise* and *sage* ones.

But before we proceed to discuss the subject, I crave your indulgence to *recolise* a little. I would not be understood as hostile to the manufacturing interest—the contrary I am an advocate for fostering “domestic industry” especially *ho* *she* *hold* manufactures, which I consider the *philosopher’s stone* for the farmer. But I protest against attempting protection by *tariffs*. As I deem the state legislatures the best judges of those branches that require encouragement, and the legitimate fountains from which the means should flow. Nor am I an importer of European commodities of any kind, and never have been.

I was formerly engaged in mercantile pursuits, and shipped flour to France, that was purchased, or rather taken by the French republic, for which they promised to pay *silver bars*, but my supercargoes no agents, could never get them or any other pay, although some of my brethren were so fortunate as to get paid for their flour from the *droppings* of the Louisians purchase. I consoled myself, however, that when the revolutionary volcano had spent its fury, France would settle down with a permanent government of some sort or other, and being impressed with an idea that no government can be permanent unless administered upon principles of *strict justice*, at the same time seeing her riches “*progressive*,” I consoled myself, as before observed, that I should ultimately get my *bars*, or an equivalent in coin. But it was not long before I was deprived of that consolation—for our own government took my claim, together with others similarly situated, into their own hands, and without our consent, relinquished them to redeem a guarantee of the West India islands, which had been pledged to France at a critical period of our war of independence, for the assistance rendered in that struggle, without which it is doubtful whether our complete emancipation would have been the result. Notwithstanding I lost my claim on France, being habitually an op-

timist I still derived consolation; as I considered the redemption of the guarantee of nearly as much importance in its consequence, as was the assistance originally derived by the pledge;—for there can be no question, but that it prevented the nation from being involved with one or other of the belligerents, at a crisis that its very existence would have been eminently jeopardised.

Ever since the loss of my flour or *silver bars*, which is more than thirty years, I have lived on my farm, chiefly occupied in *horticulture*, *farming* and *breeding of animals*; and being located in the vicinity of the *great Cattle fair*, which is attended *weekly* the year round, by farmers, graziers, and dairy men from all parts of the New England states, opportunities offered, which I was not backward in improving, of mixing and conversing with a class of men, who, for strength of understanding intelligence, and *bonate* shrewdness, will not suffer by a comparison with any class or body of men on the globe. Often have I, in times of great agricultural distress, I dined over the pens or fences, and conversed with them for hours on the causes that led to such a lamentable state of things. I have also associated with many of the most intelligent of the mercantile classes in the capital and principal trading towns of New England, during the period referred to, and anxiously sought their opinions on the measures of the national councils for promoting the commercial prosperity of our country, in which, from investments dependent on it, I felt a strong interest. I doubtless have not profited by such advantages, so much as many others would, thus situated. But I have deemed it necessary, sir, to speak thus far, of my own affairs, in order to shew the causes which placed me on the field of observation, among such practical men as I have named, during a period of thirty years, which has enabled me to assert, that the positions I am about to assume, are not founded upon hasty reflections, elicited by recent disappointments, or my conclusions drawn from perusing the writings of *political economists*. Thus supported, I fearlessly declare my most solemn conviction, that the interests of agriculture require no other protection than a free unshackled commerce, and a fair scope for competition in foreign markets. And that to legislation upon the model of what is termed the *counting house policy*, or *monopolising* system of Great Britain—to *protecting* statutes, excited by circumstances of the moment, may be attributed by far the greater portion of agricultural distress and public calamity, that has befallen the nation since the days of the “*first Adams*.” We then heard that exalted patriot and profound statesman, declare, that “the interests of agriculture and commerce were inseparable—their only effectual protection, *wooden walls*.”

A long time elapsed, unhappily too long, when the nation united with one accord to *build* those *walls*. Then arose a gleam of hope that the *gold* *en days* were about to return; but it proved delusive. The *snake* was not *killed*, nor even “*scathed*,” he laid torpid but for a moment, and has come out, clothed in a more specious garb, with renewed vigour, to protect *manufactures* with his *songs*—*charm agriculture* with his *rattles*, and crush *commerce* amid his *folds*.

I most conscientiously believe, sir, that “*time*, with which every thing rises and falls,” will prove this assumption to be a “*faithful saying*”—that it is not declamation, nor the language too lightly figurative, to portray the “*form and pressure*” of the AMERICAN SYSTEM. I shall not plough over the whole surface of that field, nor explore the *strata hidden beneath it*—my labours will be confined to an obscure corner, and I trust I shall be able to demonstrate that this same system or any of its ramifications, will operate most injuriously, if not destructively to the interests of the agriculturists of our country.

I begin with analysing the *sugar plums* heretofore given, and now held out to those *sickly children* to induce them to take their *physic*.

The first item to be examined in the catalogue, is a tariff on cheese of nine cents per pound, granted in 1816—this has, doubtless, been considered by the farmers as amounting to a prohibition, and of course a complete protection. But it is probable they, nor the national legislature, were aware that one more *potent* then existed, and still exists—namely, that such foreign cheese as would sell in the United States and could possibly come in competition, costs in the country where it is produced, with the charges of importation, exchange and a living profit only to the importer, full three times as much as cheese from the best dairies in our country! Dr. Franklin would have advised those who granted this boon, to “*save the paper*”—the parchment on which the law is engrossed, was worth more to the farmers than the protection. As we may derive instruction from this article, I shall attempt a brief history of its progress towards improvement. Before the adoption of the federal constitution, much the greater portion of cheese made in New England, was *disgastingly* inferior to what it now is;—nearly all the wealthy classes in the commercial cities and southern states, were supplied with *foreign* cheese—chiefly English;—there were a few good dairies, but so rare that their product was distinguished by the names of the proprietors. The farmers who brought their *poor stuff* to the grocers, saw English cheese selling for three times, and that from those dairies I have named, twice as much as they could get for theirs, entered into a spirited competition before the impost of four cents a pound was laid in September, 1790. Foreign cheese was considered a *luxury*, and was taxed as a fair object of revenue. The preamble to the act which contains this item, recites:—“*To make provision for the payment of the debts of the United States.*” Revenue was the only object—no one ever dreamed that it was for the *protection* of a particular class of citizens.—The discovery that Congress possessed the power of imposing prohibitory tariffs, was reserved for more “*evil times*.” This is an *exercisesence* that has attached to the constitution since that period. Had it appeared then, every hand of those illustrious patriots who organized the government, would have been put forth to pluck out the *constructive tumour* by the roots. They would have pronounced most *emphatically* that “the State Legislatures were the only *legitimate almoners* of the people’s money!”

It is said, that the want of success in the

production of good cheese, may be ascribed more to the want of knowledge in the process than to soil and climate—that a complete knowledge rests on *chemical niceties* which are not practised—of the making it *systematically* depends on the unerring rules of *science*, in which the conductors of dairies are not versed. The dairy woman having brought her cheese, by *guessing*, to such perfection as to reach the point to command a ready sale, at a satisfactory price, for the “*home market*,” keeps her *secret* and *guesses* no farther.

It is the opinion of numbers of such men as I have named, who attend the Brighton fairs, that the surest machine in New England for transmuting herbage into money, is a *dairy*, when cheese will bring six cents a pound at the door; and I believe the same may be said of all well managed dairies throughout the whole *hill country*, as far south as the cotton latitude. But we cannot well have stronger proof than that dairy farmers are more flourishing than any others; indeed, they appear to be the only class that are growing rich, except the growers of fine wool that manage prudently.

Such has been the increase of population, and the extension of new settlements where dairies do not flourish, that the supply of cheese has seldom exceeded the consumption. Sometimes, however, it does, and then it perishes in the warehouses of the sea ports, as you informed your readers was the case last year in Philadelphia—the blessed effects of a “*home market*.” As for the exportation of good rich American cheese, it is out of the question. But little of it will keep at *home* after the first year. Some skim-milk cheese is exported, to which I have no reference: for it has been satisfactorily ascertained, that the dairy woman who robs her cheese of the *cream*, robs her husband's pocket: as the loss in the quantity of *curd*, and of course *weight*, with the difference of *price*, is considerably more, than the value of the butter. There are often a few days in a season, however, when it is found, from the state of the weather, profitable to make skim milk cheese. There have been a few instances of good American cheese keeping sound to Calcutta, that was sold at twenty-five cents a pound, when English cheese, stored in the same warehouse, sold at fifty cents. But no prudent merchant will ship rich new milk cheese to warm climates. Whereas if it was made to imitate English or Dutch cheese, in *quality* and *keeping* properties, scarcely a ship bound to the East and West Indies or South America, but would have her cargo assorted with considerable investments, even at fifty per cent. above the present price. But the dairy farmers have had a “*home market*.” They saw no foreign cheese and naturally supposing the tariff protected them, had no inducement to imitate it: as they were selling at their own doors at seven or eight cents a pound, they were satisfied—not being like some of their fellow citizens engaged in other pursuits, “*never contented but with a little more*.”

Now let us suppose that Congress, instead of granting a prohibitory tariff, had offered a *bounty* on the importation of foreign cheese, (which I contend, they had an equal right to do,) for the purpose of stimulating the farmers to enter into competition with it, that they might bring the manufacture to such perfection as to compete in all foreign markets—and no doubt they can—thereby creating a very important staple of export. It is not probable you might, by this time, have seen

the slopes and *urges* of the Alleghames covered with dairy farms? And would not such a measure “*provide for the common defence, promote the general welfare, and regulate commerce with foreign nations*.” (the only “*pegs*” in the constitution the “*protecting system*” can hang upon,) full as well as a prohibitory tariff? It is said Great Britain will take nothing of us but cotton;—she would be glad to take our cheese if it was equal to her own, which she sells on the spot at eighteen or twenty cents a pound. Our merchants could not make a better remittance for “*coarse woolsens*,” than to purchase such cheese for fifteen cents.

Great Britain draws large supplies of butter and cheese from Holland; she has no land to spare for a corresponding increase of the dairy with her population. She is so much attached to *home consumption*, that double the number of horses are kept for agriculture that are necessary—*those* and her *corn laws* eat up every thing. She even imports large quantities of eggs and poultry from France. Yet in what country do *yeomanry landlords* and *tenants* complain more?

The tariff intended for the protection of other products of the soil, except those which will be noticed in the sequel, may be ranked with cheese. Ten cents a bushel on potatoes is mere sound; they are a bulky, perishable article. A few farmers in the vicinity of the eastern and northern sea ports may, in some seasons, be benefitted.—But it will come out of the pockets of those of the south, who are obliged to purchase their seal every year.

The report of the committee on manufactures, and the bill presented by them to the House of Representatives, providing for an increased tariff on wool, woollens, hemp, &c., having just come to hand, we proceed to examine the protection held out to agriculture. The first in order are wool and woollen manufactures. I must here express my astonishment at the want of information manifested by the attendants on the “*protecting system*” at Harrisburg, and of those now in attendance at Washington, of what pertains to the *firming interest*. Indeed, I cannot furnish a more forcible illustration, than to transcribe a story told of the natives of Chili, by the celebrated *Zimmerman*, which I found quoted in a recent British publication now on my table: “In Chili,” says Zimmerman, “the physicians blow around the beds of their patients to drive away diseases, and as the people of that country believe that physic consists wholly of this wind, their doctors would take it very ill of any person who should attempt to make the method of cure more difficult. *They think they know enough when they know how to blow*.” If the farmers can be induced to consider the tariff on wool and woollens any protection, it may, with truth be said, that “*credulity is indigenous*” in other climates besides Chili.

The committee state in their report, that “the very rapid increase in the importation of low qualities of wool since the tariff of 1824, furnishes the strongest reasons to conclude that they are supplying the demands and answering the use of which the coarse wool of our country would, in most cases, supply.” Without stopping to inquire whether this conclusion is not founded upon isolated facts, or whether the real cause of these importations is not *physical*; namely: that such qualities cannot, and never will be, found in our country; I would respectfully intimate to the honourable committee, that numbers of intelligent

men, who constantly attend the Brighton fairs, and whose veracity they will not question, could inform them that the farmers throughout New England were striving, with all their might, long before the fall of wool, or the importations referred to by them, to get rid of their native coarse woolled sheep, and to substitute those that produce fine. “Excellence is of slow growth;” time is required to change the flocks of a country. It has been estimated by competent judges, that within the last four or five years, half a million of native sheep and lambs have been sold at Brighton, and a great portion of those that came in autumn and the early part of winter, at prices little above the value of their *pells*. It is an unquestionable fact, that a drover has been known to start from Vermont for Brighton with a flock of *native sheep* and a drove of *swine*—and to slaughter the sheep to fatten his hogs on the road, throwing their *pells* into a wagon, to sell on his arrival.

I have made inquiries of numbers of wool growers, as to the relative profit of growing fine wool or coarse; none fix the difference at less than three pounds of fine for two of coarse at the same expense. I am aware that difference in *flocks* and their *location*, may cause some variation. I place great reliance, however, on the information of a gentleman of science and observation, who has been a wool grower for twenty years past, and, moreover, is interested in woollen manufactures, that he could raise two pounds of fine merino at less expense than one pound of native coarse wool! With such data, *figures* will demonstrate that, until coarse wool bears a price vastly higher than fine, it is in vain to think of obtaining a supply except by importation. It must appear evident, that a tariff that would induce our farmers to grow coarse wool, would shut the gates of every woollen manufactory adapted to that description of material, in the country. There are facts from official sources now before the public, which prove that the importation of wool, of *all qualities*, has not exceeded five per cent. on the quantity grown in the country; and there is the strongest presumption that the production of fine wool has nearly reached the point of demand by the manufacturers. One of the most extensive wool growers in the union, expressed to me a few days since, an opinion decidedly confirmatory—concluding with this remark, “*we only want to be let alone*.” The information I have been able to collect from various sources, justifies the conclusion, that the period is at hand, when the staple of our fine wool will be so much improved as to become an article of export. The dissemination of considerable flocks of *Saxon* sheep, has caused a spirited and healthy competition, that will, if not paralyzed by tariffs, be productive of such results, when the art of *stapling* is better understood, as to compete with the wools of Spain, and even Saxony, in the British markets.

If I have been so fortunate as to convince you that a tariff on wool will not benefit the “*farming interest*,” it will not be necessary to shew that a enormous one already existing, and the increase now contemplated, on *coarse woolsens*, will be alike inoperative. But let us look on the other side of the wall. Will any one contend that this protecting tariff will not operate, in every section of our country, as a most grievous burden—a *tax*, and nothing but an *unequal tax* on the many for the benefit of the few? And will not the agriculturists feel it most sensibly—do they not at this

moment in a very important section of the union?—those whom it is the fashion to style “nobles of the South,” perhaps from the circumstance of their showing a fondness for the innocent luxuries and elegancies of life—a taste, which, it must be admitted, has no tendency to retard the progress of civilization and the social virtues, if it does not promote them, and make men less jealous of their just rights.

This class of citizens seem, by the advocates of the “American system,” to have been placed under “the ban of the protecting empire.” Is it because they inherit a property in “persons held to service or labour,” which their ancestors protected with their blood, and which, if the constitution did not guarantee to them as sacredly as it does the New England farmer his freedom, they possess by a paramount title? I am not a *Southron*, but a full-blooded Yankee; my ancestors fled from the tariffs and destructive religion of the Stuarts and Archbishop Laud, one hundred and ninety years ago, to the banks of the Connecticut, and I now inherit some of the soil they then located;—nor am I an advocate for slavery, sir; *Wilberforce*, *Clarkson*, nor the most zealous member of the society of friends in our country, do not hold it in greater abhorrence, or will go further to promote its abolition, if it can be accomplished without manifest injustice and encroaching upon rights that are held sacred. I am sensible that it is an evil of enormous magnitude, that is increasing. But I see not a finger lifted to check it. We, of the free states, declaim and scold about it, and complain that the constitution has entitled our Southern brethren to votes in consequence of their slave population. Would it not be better, instead of treating the subject in this manner, and attempting any infringement of their rights, to consult with them as *brothers of the same family*, and endeavour, by the joint and strenuous efforts of the whole nation, to mitigate the evil, and, if possible, to lay a *legitimate* foundation for its ultimate removal.

I have never seen the question fairly met;—according to my apprehension, there has always been too much enthusiasm manifested on the one hand, and irritability on the other, to lead to an investigation of the subject in that cool, dispassionate manner its high importance demands.

We all ought to know, that a *delusion* seized the whole *christian* world with regard to slavery, two centuries ago, and continued till the war of our revolution. Even the Quakers, “*the salt of the earth*,” did not scruple to hold slaves until a few years before, when the exhortations of that exemplary man, *Anthony Benet*, convinced them that it did not comport with the principles of their faith.

It ought also to be known, that it is *physically* impossible for all the *low country* south of Virginia, and some parts of that state, to be cultivated by any but the *African race*.

White cultivators, in the present state of the country, cannot exist there. In all probability it would have been a *desert*, had it depended on their labour, to this day. Take the slaves away, and their proprietors must starve or abandon their dwellings and the tombs of their ancestors—maim them on the spot, and the remedy would be as bad, or worse than the disease.

Can we wonder, then, that our fellow citizens of that section are so sensitive on this subject? And will those feelings be mitigated by taxing them

enormously for the clothing of their labourers, under pretence of *protecting* the growers of *coarse wool*, who will never grow a pound if they can change their flocks.

The next item we shall consider is *hemp* that pays a tariff of thirty five, which the bill before Congress increases progressively to sixty dollars per ton. Are the advocates of “*independence* on foreign countries for all we want,” aware that those very nations to whom they are indebted for nearly or quite all the examples brought to *prop* the “American system,” do not *hanker* after such independence? The whole marine of Great Britain and France, are furnished with hemp from the Baltic. It does not seem to agree with the *manipulating policy* of Great Britain, to protect the growth of hemp in *Ireland*, one of the most fertile spots, and as well suited to that crop as any on the globe—and by that means add a *little* comfort, by affording employment to a portion of her *six millions* of kind hearted subjects, that have been *debaused* to be *subdued—who labour to exist, and exist to labour*. France has found it for her interest to send her wines and the *fineries* from her work shops to Russia for hemp, and *grow wheat* that often competes with our flour, in the West India and South American markets.

How do our merchants pay for the *five thousand* tons of foreign hemp that is annually worked up in our country? They take our flour, pork, lard, and a large amount of other produce to Cuba, and Brazil, and with the proceeds purchase *sugars*, which are taken to Russia, and cargoes of hemp brought back in return, to be manufactured into cordage to rig their ships, and to export to the republics of Mexico and South America. This trade demands a large amount of tonnage, with provisions for the crews. And until the preparation of hemp is better understood and practised will it not promote the “*farming interest*” infinitely more than to grow that crop?

The committee say “hemp and flax only need the consumption of duck and cordage of our extensive commerce and growing navy.” But the commissioners of the navy will not hazard their well earned reputation, by sending the national ships to sea clothed with sails and rigging made of materials the growth of our country nor will the ship owners. But if they are a little more oppressed with *tariffs*, they will send their ships to Europe to be clothed. There is no question, but by a proper system of management, hemp can be grown in the western country, and become a profitable staple at \$100 per ton; and we can prove by facts, that a small sample was prepared in New England, during the last war, equal to the best Russian hemp. The system, as now practised, is radically wrong. A high tariff, however, will not change it—during the war, hemp sold for \$350 a ton; since, the price has averaged over \$200—it is now \$275 in Boston. Where do we see hemp prepared in the Russian manner? It should be considered, that all improvements in agriculture, are of “*slow growth*.” The only method to bring hemp to such perfection as to be consumed by our marine, is for the State Legislatures to offer *large bounties* for hemp that shall equal Russian, and to encourage the erection of machinery for dressing it, by loans to the farmers for that express purpose; and even then the increase will be so gradual, that it will take probably twenty years to furnish the demand for our navigation.

If the supply could keep pace with the increas-

ed consumption for ten years, it would be doing well. In 1826, there was exported only from St. Petersburg, 29.3 tons of hemp to the U. States, and 4,639 tons in 1827. The cordage manufacturers, if the present bill passes into a law, and they are not allowed a *draught*, will be fairly *run down* by the *tariff ship*, as those of duck were in 1824. Flax may be supposed, with trifling variations, to stand on the same bottom with hemp.

The proposed increase of the tariff on *oiden spirits*, sweetened as it is with *maltsters*, as a protection to the agriculturists of the nation, is too disgusting to dilate upon. If our countrymen will take poison, it is quite immaterial whether it be hel ebore or arsenic. It is believed however, that the present high duty on West India rum, has done more to occasion the loss of the British colonial trade than any mismanagement in negotiation. As the planters had nothing but rum to pay for of our agricultural products they wanted, have not been very strenuous to induce the government to open their ports. And I think it may be fairly assumed, that had the tariff on rum been no higher than for the purpose of revenue, it would have been continued a commerce with the West Indies, demanding a much greater amount of exports from our country at large, than any advantages that have been derived from an increased consumption of grain for distillation.

Internal improvements are said to be pressed into the service of the *America system*. If that is the case, does not one of its features resemble a steam boat with her *wheels* moving in contrary directions? We find that the Legislatures of the several States, and individuals are most ardently and *laudably* engaged in cutting canals and constructing rail-ways for the express purpose of enabling the farmer to transport his produce to market at a very *cheap* rate. The advocates of the “*protecting system*,” by high tariffs on hemp, iron, and duck, are taking the most effectual method that can be devised that he should transport it coastwise and to foreign markets at a very *dear* rate. For it is as certain as that the tide will flow, as the materials for ship building advance in price, the freights of our immense *coasting* navigation and also that carrying our products to foreign ports will advance in proportion.

Having denied that Congress possess the power they have assumed, and on which the “protecting system” is based, it is incumbent on me to produce authority other than my own opinion, which certainly ought not to weigh a feather against a contrary doctrine, embraced by very able opponents. Happily I have it in my power to offer, such as I trust will be considered paramount to that of those eminent characters he they ever so learned and well skilled in the science of construction.

It was my good fortune, sir, to be on the stage when the federal constitution was formed—and during the debates of a convention of delegates, chosen by the people of my little native State of Connecticut, to deliberate upon the question of its ratification; I attended in the galleries every moment of their sessions. I was young, ardent, and *my little all* depended upon the issue; and, as you may well suppose, not a lip escaped me. I heard Wm S. Johnson, R. Sherman and Oliver Ellsworth, who had assisted to frame that compact, explain and defend its provisions, answer objections, and allay the prejudices of strong pure minded men—with such eloquence, calmness, and energy, that made an indelible impression on my mind. A

that period, the people were jealous of *privileged orders*, and a prominent objection was, that Congress might appropriate the public lands with other wealth of the nation, and grant *immunities* to some large and favorite States or class of citizens. They were answered, that, as by express provision, no money could be drawn from the people by taxes, but in the ratio of representation—the inference was *irresistible*, that it must flow back through the same channel. That considering the proviso, that all *duties, imposts, and excise* should be uniform, it would be an absurdity to suppose that *grants of land*, money, or any immunities whatever should not be equally so. That the constitution conferred no powers on Congress to make any other disposition of the surplus wealth of the nation, than to hold it in trust for the people, and that the Legislatures of the States were the only constitutional almoners of the people's money.

I do not pretend to have repeated the language used by those highly talented men, but I declare what I have stated to be the purport, that seems as vivid to my recollection as if it was but yesterday. It may be said that it is difficult to remember sentiments expressed forty years ago. I appeal to any man who has been upon the stage of life for that period, whether he cannot recollect the substance of remarks that occurred at that distance of time on particular and interesting subjects, with as much or more accuracy, than such as he may have heard within one year.

I assure you, sir, that I never shed a drop of ink in support of party politics, or with electioneering views, in my life, and never will. As I have inadvertently upon the *American system*, which appears, from what cause I cannot divine, to be in some way connected with the Presidential question, I deem it an imperative duty to declare, that I have not in the most remote degree had reference to that question, and that I entertain the highest opinion of the pre-eminent talents and integrity of the present incumbent, and a firm conviction that those associated with him in the administration are actuated by motives of the purest patriotism.

I have done, sir; if I have satisfactorily shewn you are relieved of the difficulty under which you labored, I am most richly rewarded. Be it otherwise, I feel sure of compensation by your smiles. For the notion is strongly impressed on my mind, that man is irresistibly impelled to laugh rather than weep, at the vanity of his fellows. Be it as it may, you may rest assured of my cordial good will and esteem.

SAMUEL WYLLYS POMEROY.

As an evidence of the beneficial effects of internal improvements, the Pennsylvania Gazette states that 1000 vessels and 5000 seamen may now be profitably employed in the Lehigh Coal trade.

Silk in Pennsylvania.—A Society has been formed in Philadelphia, of which B. R. Morgan is President, and Matthew Carey, Secretary, for the purpose of promoting the culture of the Mulberry, and the raising of Silk Worms.

From the National Journal.

The invention which is described in the following article will commend itself to the favor of all those who are of opinion that exposure to a chilling atmosphere would sooner mar the choicest specimens of scientific cookery. It will be regarded

as an invaluable appendage here, where the heat in the Capitol is too apt to counteract all that the fire in the kitchen has contributed for the gratification of our appetites. We hope the Table Stove will practically sustain the recommendation of the inventor.

TABLE STOVE,

The object of which is to produce, or preserve in articles of food upon the table, such heat, or temperature as may be required.

The utility of this instrument will be obvious, when we consider the inconveniences and difficulties attending the preparation of such articles as require heat to render them palatable.

The application of the instrument being the principal constituent in the invention, any peculiar form or invariable structure, will not be considered essential. The Stove may be constructed of either tin, iron, or any other suitable material.

For cheapness, it may be made of tin; the height about four inches, including the foot; the top formed to receive the dish with food, which is placed upon it. Under the dish is a furnace or fireplace, formed by means of a drawer, which may be taken out, to be supplied with burning coals, or any species of fuel, and replaced; near the front part of the drawer is a grate, to prevent coals or other substances from interfering with a small door, through which the furnace is supplied with air; and to prevent any inconvenience which might arise, there should be a pipe attached to carry off the smoke, or other discharge from the furnace. By means of two or more sections of pipe, with long bends, connected by ball and cap joints, or straight pipes joined in the same manner, whose sections will slide or sheath into each other, leading from the furnace to the ceiling above, any position of the stove may be accommodated; and by means of a small cord and pulley, the pipes, when detached from the stove, may be raised to the ceiling. Between the furnace and the dish may be placed either a close partition, or one admitting a communication to prevent or admit the direct action of heat to the plate. Between the furnace and the table, there should be a non-conducting partition, to prevent heat from descending upon the table; and there should be such a division between the furnace and partition, as to admit a free circulation of air between them. The top of the furnace, where it supports the dish, should be large enough to admit a cover for the plate and the articles upon it. It is entirely optional, what number of stoves are used upon the table and elsewhere, the object being either to cook, or offer the food in a suitable temperature. They may extend to a stove for warming the dishes for the guests, or even to a stove for each individual. Articles may be transported any distance unexposed and one dish kept in waiting for another; but in the ordinary way, it is found impossible with every exertion, to furnish the articles in a suitable temperature; and even such as are offered in a palatable state, soon lose their heat and flavor, and whoever is not down at the first stroke of the bell, must nince his meat cold and insipid. J. W. POST.

The sugar Maple.—This tree, so little thought of by our northern agriculturists, would, by proper attention, in a little time become a source of profit to the country. I am not a little surprised that our farmers should have been so long inattentive to the subject. The rock-maple will pay for its own rearing, in timber and fuel; so that

the sugar and molasses which it yields will be nearly net gain—as the business of making sugar would be carried on at that season of the year when little else could be done. I hope the work will be soon begun—let each farmer, as every spring and autumn comes round, transplant from his forest to the sides of the highways leading along his lanes, as many of these trees as he conveniently can, until the ground is completely occupied. What a change such a course, if generally pursued, would effect in the appearance and condition of the northern States. Our highways and avenues, lined with this useful, cleanly, and highly ornamental tree, would give new life and animation to the valleys and mountains, and greatly add to the beauties of our scenery. And instead of importing hundreds of thousands of hog-heads of sugar and molasses from the West Indies yearly, we should in the short space of twenty-five or thirty years, not only supply ourselves with these indispensable articles, but should have a surplus, which at no distant period would be an important item of exportation.

FOR THE NEW ENGLAND FARMER.

DISEASE IN HORSES.

MR. FESSENDEN.—Mr. J. N. Ludgdon of Kennebunkport, in your last paper, [see page 282 of the current volume,] states the case of his neighbor's horse, being severely purged; that he emaciated rapidly and that the disease had continued nearly six weeks. "When he is still for two days, he becomes apparently well, but as soon as he is rode the complaint returns. The day previous to his attack he was fed with corn, and rode about twenty miles."

The disease is a chronic inflammation of the mucus coat of the stomach and bowels, produced by the corn and exercise, and affects the whole digestive apparatus. Astringents and tonics so frequently recommended in this case, prove uniformly injurious, and often fatal; he requires bleeding, abstinence, and rest. I would recommend eight quarts or 16 pounds for the first bleeding, taken from a large orifice in the neck, and receive the blood in a pail, to ascertain the thickness of the inflammatory or buffy coat, which will probably be from two to three inches. The same quantity should be taken every second or third day till the evidence of inflammation should disappear, which will probably happen on the third.

He should be fed on bran mash exclusively with but little hay—He will begin to recover his health and flesh in ten or twelve days. I would here remark that there is no disease in horses more uniformly misunderstood than purging, diarrhœa, and scours, which are only aggravated degrees of the same complaint, and they will bear the loss of blood in proportion to the augmentation of disease. In 1817, I had a fine young horse so far reduced with scours that he was unable to stand, which had continued nearly six weeks. I became convinced that it was inflammation of the bowels, and I ordered him bled twelve quarts. In 24 hours both the thirst and diarrhœa were considerably abated; the second day he was bled twelve quarts more, and he had so far recovered his strength by the removal of disease, as to get up and lie down at his leisure and manifest some little appetite.—

Supposing the disease broken down, I left him for three days, presuming he would gradually recover, but on examination I found no improvement.— I ordered him bled 30 pounds, and repeated the same bleeding the following day, with such marked benefit that I became convinced the inflammation was still unsubsided. I repeated the bleeding at different intervals until the loss of blood amounted to 170 pounds, when the horse recovered his health and strength, and his constitution was unimpaired by the disease. Yours, &c

FOR THE NEW ENGLAND FARMER.

FOXTAIL.

MR. FESSENDEN.—Allow me to call your attention and that of your readers, to a kind of grass richly deserving the notice of the farmer. I refer to the proper foxtail, (*Hopocurus pratensis*) in its general appearance closely resembling timothy, or herds-grass. I have looked in vain for an account of it in the agricultural journals of Massachusetts, where many other grasses, less meritorious, have received considerable attention. Compared with herds-grass, it has the following advantages: 1st It comes to maturity a month or six weeks sooner and may be cut accordingly. I have often seen the full grown heads on stalks more than five feet in length, as early as the last of May. 2d. In quality, I believe it will be found equal with herds grass; in England it is considered superior, as a fodder for cattle. Our farmers are in the habit of cutting early in June, what is called speargrass (*Poa pratensis*); foxtail is earlier than this, and in every respect superior. 3d. Foxtail, it is said, grows equally well on dry or moist land; the latter, I believe to be more favorable to it, which its early growth seems to denote. It does not require any more attention than herds-grass.

If I mistake not, there are fields of it in your vicinity; if so, perhaps the statement I have made will receive some notice from those who cultivate it, as confirmed or contradicted by their experience. Yours, &c

PLANTING OF TREES.

MR. FESSENDEN.—In looking over the 5th Vol. of the New England Farmer, I was not a little pleased in finding so much urged in favor of planting trees. I should be highly gratified if I could suggest any thing that would aid in furthering so desirable an object. Even as a matter of rural speculation, what project could be adopted that would so surely add profit to pleasure. Some one has said of an industrious and beneficent citizen, that he may be followed by his track; these few words fully portray the cares of a worthy man, who in cultivating the earth, leaves marks of his industry, and of his love for those who may succeed him.

One of the greatest defects of a farm, says an excellent French writer, is the lack of wood—not only for fuel, but for general use. A proprietor who well understands his interests, ought to find on his own lands all the wood necessary for purposes of building, &c. Little is planted and much extirpated by those attentive only to the fruition of the present moment; but the prudent father of a family, who places his consolation in thinking

that he lives again in his children, will plant much, and fell little. The Tartars of Dagestan, all Tartars as they are, inhabiting a sterile country, have an excellent custom which they carefully observe, and which they hold as a law. No person with them can marry before having planted in a certain indicated place, an hundred fruit trees; so that there are actually found every where in the mountains of that country of Asia, grand forests of fruit trees of every species. Cyrus caused Asia Minor to be covered with fruit trees; and it was from its spoils that poor Europe was enriched. It was a dogma of the religion of the Guebres, that one of the actions, the most agreeable to the Supreme Being, was the planting a tree.

Cato said it was necessary to reflect a long time before building, but that the making of plantations should not be deferred an instant.

But presuming New England cultivators are now sufficiently apprized of the utility and importance of planting, both fruit and forest trees, I need only offer some remarks on the manner of arranging them to the best advantage. I would recommend the ancient quincunxial mode of planting. The advantages of this method are, more trees, at any given distance apart, may be planted on a given space than in the customary way; and each tree will be at more freedom to flourish, being equidistant from its neighbors in every respect—as if planted in the centre of a circle, or rather hexagon. The explanation of the quincunx in Dr. Deane's Geographical Dictionary is entirely erroneous; and the description of it in Dr. Rees's Cyclopedia is inaccurate, and not easily intelligible. The quincunx order is not a plantation of trees disposed in a square, consisting of five trees, one at each corner and a fifth in the middle—repeated again and again. It has its name from the numeral V;—three trees being planted in that form, are called the single quincunx. The double quincunx, is the V doubled, which makes an X—being four trees planted oblongly with a fifth in the centre, like the five of spades in playing cards. This being often repeated, forms the following figure, a connected series of equilateral triangles:

Cabbages, beans, strawberries, potatoes, &c. may also be thus planted. I mention the potato, to induce an experiment made in my family above a dozen years ago. When about making starch, it was concluded to try which would yield most, the common round [English white] or long red [La Plata] potatoes; supposing the last most nutritive, as they are preferred by cattle and swine. Sixteen pounds of each, weighed after paring, were made into starch separately by the usual process. When dried, the starch from the long red weighed twenty-four ounces— that from the round white fourteen ounces. As potato starch is an article in great demand, this experiment may be of use to those who manufacture it. This starch is an

excellent demulcent, soothing remedy in coughs, the potato belonging to a more early tribe of plants. From this experiment, I think it may be infered, that the long red potatoes are preferable to others for live stock. Wishing you increasing success in your laudable exertions, I am, yours, &c.

FOR THE NEW ENGLAND FARMER.

FEDGREE OF HORSES

MR. FESSENDEN,—I send you the pedigrees of the horses John Richards and Rattler. The first is highly esteemed as a stallion, in the State of New Jersey, where he has covered two seasons. The second covered one season in the vicinity of the city of New York; and his stock, now rising two, is very good.

John Richards, a brown bay horse, foaled in 1819, bred in Northampton, North Carolina; got by Sir Archie; dam by Rattler (by Shark); grandam by English Medley; g. grandam by English Wildair, out of Nonpareil mare. He was asserted to be the best horse of his year in the South at four years old; but was then lamed. He is own brother to Betsy Richards, who has been the best mare in the States.

Rattler, (I believe a chestnut horse, I do not know where foaled), bred in Mecklenburg, Virginia; got by Sir Archie; dam by English Robin Redbreast; grandam by English Obscurity; g. grandam by English Wildair out of an English Cub mare. He is own brother to Pirtilla, who has beaten the best Nags.

TOWSELS.

MR. FESSENDEN.—As towseles are an article which have lately come into use in this country, if you or any of your correspondents have any facts relative to their cultivation, you will confer a favor on the public by making them known.

The following questions I should like to have answered: What kind of soil suits best? What time ought they to be planted, and how? Whether in drills, broad cast, or hills? And, what time are they fit for the market? Yours, L. W. B.

Bristol, R. I. April 5, 1828

[From the New York Farmer.]

MODE OF PLANTING THE GRAPE.

The months of March and April, being, in this country, the most favorable season for planting the grape vine, I thought it might be interesting to those who wish to undertake the cultivation of this precious plant, to offer some remarks on the best mode of performing it. With this view, I take the liberty of addressing to you the following lines, which you are welcome to insert in your journal if you think them useful.

The grape vine is produced either from the slip taken from good and wholesome vines, or by transplanting the roots themselves. By the first mode, it requires six or seven years before the vine can be in full bearing; and for the two first years, you have to replace the plants which have failed and which may be generally estimated at one third part of the whole that has been planted.— The second mode is far the best— for, by being supplied with good roots, about two or three years old, there is no danger of losing them, and on the second year, they will yield fruit.

In countries subject to severe winters, the season for planting is the latter part of March or the beginning of April. Trenches, eighteen inches wide and twenty deep, must first be prepared.—Could these trenches have been made in the course of the preceding summer or autumn, it would be still better; the earth, thus having had time to lay open to the air, would be more favorable to the plant. The most economical and expeditious way of performing this operation is by using the plough, and going three or four times over the same furrow with it; after which, the loose earth is taken out with the spade, and the trench made to a proper depth. If the plantation be but small, or the expense no consideration, the best way is to work the ground altogether with the spade, and turn it up in all directions.

In lands which are very dry, you must plant from fifteen to eighteen inches in depth; the drier the soil the deeper you must plant. In rich soils, from twelve to fifteen inches are sufficient. The plants ought to be placed four, five, or six feet distance from one another, according to the quality of the soil. The richer it is the more distant the plants must be. If horses be used for ploughing, the rows ought to be placed at six feet distance; and at seven, if oxen be used. The rows must be in a straight line, in order to facilitate the ploughing. Finally, if the spade be only used, the plants may be placed at five or six feet distance, both ways—but in all cases, care must be taken not to place the plants of one row immediately opposite those of the next row.

The best mode of planting the grape vine, is thus: You lay down six inches of the plant flat at the bottom of the furrow or trench, and lean the upper part of it on the side of said ditch, so as to form the figure of an angle, then placing one foot on the roots to press them flat with the bottom of the ditch, you cover the plant with three or four inches of good soil well pulverized, or two handfuls of moistened ashes, which are pressed strongly over with the foot. After which, the trench is filled up with earth, only leaving out, uncovered, two eyes of the plant. The trenches, at the time of planting, must be free from water; if any should remain in them, wait until they are dry.

Rousseau's Herbal.—We have just seen the MS. *Herbal* of the Philosopher of Geneva. It consists of eight small folio volumes, bound up neatly in vellum, each volume having a thong of the same material bound three or four times round it. The plants are crushed flat, and fastened to the paper with gum; and the natural history, or rather the scientific description of each, is written on the opposite page, in Rousseau's small, beautiful hand-writing. A very pleasing scent exhales from the volumes when open; and neither the leaves nor the flowers of the plants have lost their brilliant colors. The MS. is valued at three hundred guineas.—*Weekly Review.*

Dahlia.—This most beautiful autumnal flowering plant is a native of Mexico, and of late introduction into this country. It has more than 150 varieties now cultivated in Europe.

Potato Flour.—A Dorsetshire farmer, who has recently made some experiments in the preparation of this article, states as the result, that a bag of potatoes (210 lbs.) will produce 60 lbs. of flour; and that plain puddings made with two-thirds po-

tato flour, and one third wheat flour, are even superior to those made wholly of the latter. On ordinary lands, 100 bags will be produced from an acre, so that 6000 lbs. of flour may be obtained from an acre of land. Potato flour is now much used in Scotland.

An earth has been discovered in Virginia, which contains portions of Gypsum, and is successfully used as a manure.

Method of salting Butter.—Take of sugar, one part—nitre one part, and clean salt two parts; beat them well together and put it by for use.—To every pound of butter, [when it is freed from the butter-milk] take one ounce of the preparation, and mix it thoroughly together. Butter salted in this manner and put down in tubs with a little melted butter poured over the surface, to fill every vacuity, before the top is put on, will keep for many years.

From the New-York Farmer.

ON THE CULTIVATION OF CARROTS, BEETS AND PARSNIPS

To insure a good crop of any of these roots, it will be requisite to be provided with a sufficient quantity of well fermented heavy manure, which may be laid on the ground two inches thick, and broken with the hoe. The ground should be deep dug and the manure well mixed with the soil. This work, where the soil is light and dry, I would prefer having done in autumn, so that the manure might have time to be incorporated with the soil; and in the spring the ground should be dug over again. Parsnips and carrots may be sown as soon as the ground is fit to work in spring, but beets are more tender and are easily killed with frost when young. For carrots and beets, the drills should be drawn at the distance of 18 inches from each other, and 16 inches between the 5th and 6th drills; which will throw them into beds of 5 drills. This is a great advantage in cleaning, as the 16 inch space serves the purpose of an alley, and keeps the beds more open and loose. The seeds of beets should be dropped into the drill at the distance of three inches, seed from seed, as the beet seed sends up several plants from each seed; and by having them dropped at that distance a great deal of labor is saved in thinning, and the plant has a better chance to advance from the beginning. Carrots ought not to be sown too thick; it will therefore be requisite to rub the seed well between the hands to take off the beardiness which is attached to the seed; this will make the seeds adhere less to each other, so that it may be sown more regularly along the drill.—When the plants of beets or carrots have put out four or five leaves, they should be thinned out to the distance of six inches, plant from plant; the beds should be kept clean by frequent hoeings, till the plants cover the ground, when the seeds will be effectually kept down by the crop.

Parsnips should have 16 inches between the drills, and an alley of 20 inches between every four drills; they should be thinned out to 6 or 7 inches, plant from plant; when the vines are very luxuriant, they should be broken down either by trampling them with the feet, or by drawing a roller over them; this process takes but very little trouble, and is of great service to the swelling of the roots. In the keeping of these roots through winter, great care should be taken to have them dry, that is, in a dry place. Parsnips will stand

the winter where they grow; so that those for spring use may be suffered to remain till wanted for the table.

Carrots and beets may be laid in a pit three feet deep; and two and a half wide, and covered with two feet of earth, well beat with the spade to send off the water. Parsnips should be laid into the pit with a layer of earth or sand between each layer of roots, which will keep them well colored and free from rust, which they are very subject to when laid up without having earth between them. In planting out any of these roots for seed, the most genuine roots are to be selected; they should be planted up to their necks in the ground, at the distance of three and a half feet; when they send up their flower stems a stake should be put down beside each plant, to tie them to; and it may be requisite to run cross bars between the stakes, especially for beets, which should be well tied up. When the seed begins to ripen they should be looked over, and the ripe seed taken off, which may be easily known by the change which takes place in the color. Carrots change from a light green to a brown; and beets get likewise of a brownish color. Parsnips get to a light yellow, and will lose their seed with the first wind after its arrival at maturity. The seed first taken off should be kept by itself, as the earliest on the plant is generally of a superior quality to the later produced part of the seed. The seed when taken up should be hung or laid in an airy room or loft, till it is perfectly dry; it should then be rubbed out and put in boxes or bags, and kept till wanted. WM. CURR, *Gardener, New York.*

To keep butter from growing rancid.—To one peck of fine salt add one ounce of crude sal ammoniac, and two ounces of salt-petre, both finely powdered; and mix them well together. With this mixture, work your butter till the milk is entirely extracted; and then put it in firkins, salting it with the above preparation, to such a degree as to be palatable. This mixture is stronger than the clear salt, and of course less is required.

Early Potatoes for feeding swine.—It is a good practice to plant some early sort of potatoes on a small fertile piece of ground near your hog sty; which together with your peas (if you have any) will enable you to bring forward your pork, and half fatten your hogs before your Indian corn is ripe enough to gather.

We notice as uncommon productions of the season, (says a Charleston paper) the artichoke, as large as the crown of a man's hat; and strawberries of a very large size, which we saw this morning. They grew in the vicinity of Canonsborough.

Peas.—Field peas should generally besowed early in the spring as the ground can be got into proper order. The last week in April, or the first week in May will do very well, but if the soil is a light sandy loam, which is recommended for that crop, they may usually be sowed still earlier to good advantage. But when it is feared that they may be infested by bugs it will be safest to sow them as late as the 10th of June. Col. Worthington, of Rensselaer County, New York, sowed his peas on the 10th of June six years in succession, and a bug has never been seen since in his peas. Whereas, his neighbors, who have not adopted this practice, have scarcely a pea without

a bug in it. He supposes the season for depositing the egg of the pea bug is passed before the peas are in flower. Col. Pickering likewise expressed an opinion that the bug may be avoided by late sowing, but the hot sun in June will so pinch the late sown peas that the crop will be small unless the land be moist as well as rich.

Erratum.—In the article "on the effects of the protecting system, &c." page 300, last paragraph, leave out the words "I have satisfactorily shown."

New Treatise on Flowers.

In press, and will be published the beginning of the ensuing week, at the office of the New England Farmer, and by G. Thompson & Son, New York. "A Treatise on the Cultivation of Ornamental Flowers: comprising Remarks on the requisite Soil, Sowing, Transplanting, and general Management; with Directions for the general treatment of Bulbous Flower Plants, Green-house Plants, &c. By Roland Green." Price 37 cts.

Just Published

And for sale at this office, "Observations on the Efficacy of White Mustard Seed, (Sinapis alba) taken whole. From the 10th London edition, revised and improved." Price 6 cts.

N. A. Review

This day published by Frederick T. Gray, Boston, and G. & C. Carrill, New York, the New American Farmer, Contents, Von Donin's Memo.—Legal Condition of Woman—Structure of the Indian Languages—Hope Leslie—North Eastern Boundaries—Revolution in Paraguay—Florida—Duelling—Canton Hall's Voyage to the Eastern Seas—Travels in the East—Quarterly list of New Publications—Index &c.

Hawthorn Quicks.

For sale at the Seed Establishment, No. 52 North Market street, 5000 two year old seedling Hawthorn Quicks, for line fences—in fine order, at a moderate price.

One barrel Early Royal George Potatoes, early and prolific growers. Two casks Virginia Spines Potato Spigs. 6 casks Early English Manly—English Kidney, and Cheague seedling Potatoes.

10 barrels Early Frame Peas, raised in Bangor, Me. A further supply of the celebrated New Zealand spinach. [T. Travers's opinion.]

1000 pounds Irish Lucerne, imported from Europe this spring. 20 barrels English White Mustard Seed.

Also, seeds of the following: Yellow Tobacco, Tansel, Leunis, Spring Wheat, Spring Rye, Barley, Rape, Broom Corn, Spring Vetches, Castor Oil Bean, Corn (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Bernet, Orchard Grass, Rye Grass, Tall Meadow Oats, White and Red Clover, Man, & Vortzel, &c.

Also, Seeds in Doors, used in Ornamental Flower Seeds, &c. comprising the largest collection of Seeds to be found in New England.

A supply of the Roots of "WILMOT'S SUPERB STEW BERRY"—measuring six and eight inches in circumference, is daily expected from Europe.

SUPERB BULBIOUS ROOTS.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbious Roots, suitable for spring planting. Consisting of Black, purple, orange, violet, crimson, &c. Also, seeds of the following: Yellow Tobacco, Tansel, Leunis, Spring Wheat, Spring Rye, Barley, Rape, Broom Corn, Spring Vetches, Castor Oil Bean, Corn (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Bernet, Orchard Grass, Rye Grass, Tall Meadow Oats, White and Red Clover, Man, & Vortzel, &c.

hose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 50 hundred feet Rose bushes—30 do. Privet, or Calibago 10 do. four seasons—30 do. Damask—30 do. Burgundy—5 do. Austrian—25 do. Marble—10 do. Tuscany—100 do. French—6 very large pines mostly Red—fifteen years old, and in prime health—7 varieties Double Dutch—Single do—5 Long-stemmed Indica, or Grape Myrtle, two of which are 25 years old—20 Grape Vines, (White, Sweet water)—Snow Ball—White Lilacs—Red and White Lilacs.

ROSE WATER.

30 Demijons Double and Single distilled Rose Water, entirely from Damask Roses. The above Rose Water is constantly kept for sale at Mr. C. Wade's Power Collar, No. 12 Merchants Row, by Demijon or less quantity.

Grapewater, &c.

Du Pont's Gun Powder, at 25 to 50 cts per pound—Shot—Balls—Flints and Percussion Caps. Also, Alon—Refined Salt Peter—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 63 Broad street—By E. COPELAND, Jr

The Du Pont soil as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston" on the head of the cask.

Landreth's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquisition of useful and ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department, kept in native and exotic Plants—contains a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Esulent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seedling—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance undoubtedly ensures in an eminent degree, to give the fruits and dispositions, unavailable in a dependent order for foreign importation, or on such or imperfectly growers at home. Orders, received by Parker & Codman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15.

D. & C. LANDRETH.

N. DAVENPORT offers for sale at his Nursery in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Pears, Peaches, Prunes, Vegetables, &c. Gooseberry, and Currant Bushes. A list of which can be seen at the office of the New England Farmer, or Agricultural Warehous—and will be inserted in the New England Farmer occasionally. At this Nursery, however, it is not so much an object to present the imposing display of a great number of the names of different fruit, as to keep a choice collection of those sorts, whose excellence is well known and established.

Orders are respectfully solicited, and will receive prompt attention of J. R. WELLS, at the Agricultural Establishment, No. 52 North Market street; or with FERRIS & DAVENPORT, No. 713 Washington Street—or at the Nursery in Milton. Feb. 29.

JAMES BLOODGOOD & Co's, Nursery at Flushing, on Long Island, near New York.

IN behalf of the Proprietors of the above Nursery, the subscriber solicits the orders of Horticulturists who are desirous of procuring choice and early bearing and vigorous Fruit Trees of the finest sorts, and most healthy and vigorous stocks the present season.

Bloodgood & Co. attend personally to the handling and Laying out of all their Fruit Trees—and put Passes may rely with confidence, that the Trees they order will prove genuine. The subscriber, Agent of the above Nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,

FLOWERING SHRUBS,

AND PLANTS

The Trees will be delivered in this City, at the risk and expense of the purchaser—the bills may be paid to him. The reputation of this Nursery, so extensively known, and it has been so well sustained, that I do not believe to refer those in want of Trees, to any of the Horticulturists in this City and its vicinity; and if peculiar demonstration is desired, I invite those who wish to be thus satisfied, to examine the Trees in my garden at Flushing, prepared from this Nursery for four or four years past—some of which are now in bearing, and in a healthy and vigorous state.

Catologues will be delivered gratis, on application to ZEB. COOK, Jr. Rogers' Buildings—Congress St.

Engrafting and Garden Work.

REFUS HOWE, of Danvers, has his friends and the public, that he will attend to the Engrafting of Trees or Garden works. He is a good and careful engrafter, and thinks he can give satisfaction to those who may be desirous to employ him. Reference can be had to Mr. Samuel Downer, of Dorchester.

38 April 4

40,000.

For sale, Four Thousand engrafted APPLE TREES, from two to four years from the graft—consisting of forty-three of the most approved and superior Fruits; including early autumn and winter Apples. Also, other Fruit and Ornamental Trees. Orders may be sent to this place via Post office, directed to FRANCIS WINSHIP.

Brighton, March 21st, 1823.

Farmer Wanted.

A young farmer with his wife, is wanted, to take charge of a farm about 10 miles from New Haven. A young Massachusetts farmer who thoroughly understands his business, and whose wife is acquainted with the management of a dairy, and who can furnish testimonials of economy, industry, and industry, will have an opportunity to make a permanent and advantageous bargain. Inquire at the New England Farmer Office. New York, March 25, 1823.

Marrowfat Peas.

For sale, a consignment from Albany of 50 barrels Marrowfat Peas, by the barrel, at a very low price—Inquire at the Seed Establishment, No. 52, North Market street.

Horse Wanted.

A gentleman who is located in a section of Massachusetts where there are many desirous of raising colts, wishes to hire for the season, a full blooded and good framed Stallion, or if it will be proper, would board the horse (and a groom if desired) at a very low rate.—Enquire at this office.

Fruit Trees.

WILLIAM BRINEE, the Proprietor of the Large new Botanic Garden and Nurseries at Flushing, on Long Island, has the pleasure of announcing that his Nursery now contains 172 varieties of the Apple—2 do. of the Pears—7 do. of Cherries—2 do. of Apricots—21 do. of Peaches—2 do. of Nectarines—1 do. of Almonds—14 do. of Mulberries—6 do. of Quinces—16 do. of Figs—16 do. of Currants—15 do. of Raspberries—12 do. of Gooseberries—2 do. of Strawberries—27 do. of Grapes—1 do. of Ornamental Trees, &c. Above 5 of the above kinds of Fruit are not to be found in any other collection in America. The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are propagated from bearing trees. The Cherry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of F. R. WELLS, of the Agricultural Warehouse, 52 North Market street; gratis, and orders left there, or sent by mail, will meet prompt attention.

March 14

Table with 2 columns: Item Name and Price. Includes items like Apples, Beans, Butter, Flour, Grain, Hogs, Lard, Plaster, Pork, Seeds, Wool, and Provision Market.

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

Occasioned by reading: "The Grave of Napoleon," in the Farmer of the 28th of February last.

FAME WORTHLESS WITHOUT VIRTUE.

O'er private greatness sympathy will mourn,
Though seas of blood have once that greatness seen;
But sympathy is not a vision wild,
And shields with it are worthless and defiled.
'Tis true, the course victor soar'd on high,
Like a broad meteor in the troubled sky.
His furious arm o'er bowing nations roll'd;
He crush'd his enemies, and he clutch'd their gold.
Sceptres and crowns at will, he gave, or took,
And o'er his name, remotest empires shook.
Dare number of the grooming world he stood,
His all embark'd upon a crimson flood!

A length reverse to victory succeeds,
The vanquish'd triumph, and the victor bleeds—
His veterans, oh! a nest have pass'd away—
His mighty empire's crumbling to decay—
His crown has fallen; his iron sceptre's gone;
The lord of kingdoms finds himself alone!

A feeble captive, to Helena's aisle
Departs the Chief, who triumph'd o'er the spoil;
There, that pointment spread its baneful shade,
And his fierce soul upon its mansion prey'd,
Till death, that conqueror of lungs, drew near,
And laid the restless hero on his bier.

He seal'd the summit of imperial power,
And sank from sight in dark affliction's hour
How keen the pangs his lofty spirit felt,
What sad presages in his bosom dwelt,
When the vast object of his whirlwind course,
Was roughly pluck'd from his strong arm by force
When the world's dadem, so near his own,
Fell from him, and he trembled for his throne;
When still increasing weakness bow'd him down,
To yield his hopes, his sceptre, and his crown,
What sad reflections rent his troubled breast,
When dire disease his sinking frame oppress'd;
When death, the good man's friend, the sinner's dread,
With certain aim his fatal arrow sped.

The height of worldly pomp, and depth of woe,
Pass'd o'er the head of him who lies so low!
We see the contrast, and our souls will melt,
And feel in part, the very pangs he felt.
So sympathize on earth, when Caesar fell,
And so the weeps, e'en o'er the Prince of Hell!
But justice knows no sympathetic tear,
True worth 's the standard of her righteous school;
And tried by this, Napoleon sinks beneath
The lowest, poorest, virtuous, that breathe.
Self was the object of his constant aim
Whose altar blaz'd with a perpetual flame,
For her, he intrigued—and for her he fought,
And all his mighty powers to action brought
No sacrifice for her, too dear, was found,
Though waves of blood and tears the nations drown'd
Shall he be sanctified then, whose wild career,
Fill'd earth with desolation, and with fear?
Have we no feeling, but for him who sleeps
Upon that wave worn rock, and eastern deeps?

Whose sword made mothers childless—at whose word,
Whole armies were in ghastly heaps invert'd!
Where nations mourn, who scales the grief can weigh?
Whose eye the wide extent of war survey?
But my roads bleed, and millions e'er them cry,
Not worth a tear, unworthy of a sigh!
While the fierce tyrant who mangled the wound,
Has both a hand and a foot found!

Let those that please, the bloody victors crown,
Who hear their paths terrific to remove;
What though at length they sink, as once they rose,
Crush'd by the angry strokes of vengeful foes?
'Tis but a just reward, ambition's gain,
A righteous retribution, pain for pain

For woes they once inflicted, now they feel;
The sword alone can pierce their hearts of steel;
Earth is befriended when the conqueror wanes,
And sounds of joy reanimate her plains.
Thus she rejoic'd when Gallia's monarch fell,
And still the notes upon the breezes swell,
So let each warrior sink, no more to rise,
Who draws his ruthless sword for fortune's prize
Could I once stand beside Napoleon's grave,
Where Helen's rock denies th' eternal wave,
Thus would I mourn the celebrated dead,
Who there reclines his solitary head.—
The robes of a fallen Chief lie here,
Whose very name the nations shook with fear:
His vigorous form, a powerful mind sustain'd;
But fell ambition had his soul enchain'd.
A thirst for empire, and the hero's fame,
Scorch'd every virtue with a ceaseless flame.
O'er seas of blood to power sublime he flew,
And kingdoms and republics sank from view;
'Till the dark clouds of vengeance round him burst,
And laid his empire and his schemes in dust,
Thus cied his projects, and thus fell his crown,
His sole inheritance, a bad renown!

Oh, had his active soul but lov'd the truth,
When the bright morning beam'd upon his youth,
Then had his brow have worn a diadem,
Unfading as the oriental gem.
What evils had he quell'd, what good perform'd,
Had real virtue but his bosom warm'd!
How had his glorious fame thro' nations ran,
And gam'd the love and gratitude of man;
Pierc'd thro' the shades of death, and rose on high,
A quenchless star in the eternal sky.
But now, his name must with the wicked rot—
Enroll'd as infamous, or be forgot.
The blood of slaughter'd millions, from the ground
Cries out for vengeance, with prophetic sound;
Woes countless, indescribable, were strow'd
Around the awful path his falcion hew'd,
With fearful aspect, all against him rise,
And wait the righteous sentence of the skies.
Where has his spirit fled? Ah! where indeed,
Since from its emburied bow'd of earth, 'twas freed?
None but the orphan's friend can this decide,
The widow's God—before whom kings are tried.

Gilsum, N. H.

CANTHOR.

Alligators.—The alligator is the most terrible animal of this class. Vast numbers are seen in the slow streams and shallow lakes of Florida and Alabama; but they abound most on Red river, the Mississippi lakes, and the bayous, west of that river. On these sleeping waters, the cry of a sucking pig on the bank will draw a shoal of them from their muddy retreats. The largest alligator, ever killed in these regions, measured more than sixteen feet. They have at times, especially before a storm, a singular roar or bellow. When moving about in the water they seem like old logs in motion. In fine weather, they dose on the sand bars, and such is their recklessness, that they allow people to pass in boats within a few paces of them. A rifle ball will glance from their bodies, unless they strike in a particular place. The animals when slain, emit an intolerable musky smell, and it is asserted that its head contains a quantity of that drug. They sometimes chase children, and would overtake them, were it not for their inability to make lateral movements; for having few joints in their body, and very short legs, they cannot readily turn from a straight direction. Consequently, those who understand their movements avoid them without difficulty, by turning at right angles. They are chiefly formidable to pigs and other animals of that size. The skin is valuable to the tanner.—*Flint.*

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—and of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises state of our most prominent sorts.

<i>A. trichole.</i>	Green Globe	<i>Melon.</i>	Pine Apple
<i>Asparagus.</i>	Devonsire		Green Citron
	Grass-land		Peas
	Batavia		Yanagee
	Large white Reading		Large Canteleupe

BOSTON, FRIDAY, APRIL 18, 1828.

No. 39.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

SILK.

[The following article on a subject of great and increasing interest in the United States, from the pen of an able and patriotic correspondent, composes a part of the contents of a volume now in press, (in Boston) entitled the "NEW AMERICAN GARDENER," which will compose, not only directions for the culture of all the vegetables usually raised in gardens, but remarks on Fruit Trees, Flowers, Ornamental Gardening, and some of the most prominent productions of Field Husbandry. It is principally compiled by the Editor of the New England Farmer. Some parts of the work, however, are from the pens of some of the most experienced and scientific horticulturists in Boston and its vicinity. It will be published by John B. Russell, (proprietor of the New England Farmer) and be ready for delivery in the course of six weeks.]

The cultivation of the soil is a duty which was imposed on man almost coeval with the creation. It bears with it the sanctity of a primeval ordinance, and is irresistibly endearing, in as much as it admirably suits our nature, so as to promote in a singular degree, health and comfort, vigor and clearness of mind; the blessing on a ready compliance, with this divine law, is evident, from the happiness which flows therefrom, and which would make of the cultivators of the land, under some better advantages of education the greatly favored order of society. It is at the table of their own providing, that the nation is entertained—it is to the vigor, and to the faithfulness of their arm, that it trusts for its security.

All hail, Agriculture and its noble bands! On the fragrant earth their appointed labor is performed; their dome is the pure vault of heaven, and their employ is that, by Mercy assigned, for the renovation of our race. There, since the days of old, has been the firm foundation of national greatness and prosperity; and there it must remain until the end of time. It is to those purposes, that comprehensive and active minds would find delight in directing their powers, because of the vastness of the field to explore, and of the greatness of the results to be expected.

Much has been said of the roughness of the New England soil and climate, and much more than ever was true. Since the time of the pilgrims, however, what harshness there was has been softened, and the climate in our days, is hastening to take its rank among the most favored for temperature and healthfulness. When the eye roams among our hills and vales, where can we meet with a more delightful variety? or a choice of aspects, and situations, so valuable for agricultural purposes? Some of our land is hard to work, because it wants a more thorough cultivation; and some abounds with rocks, that we may find there the best materials for our dwellings. What is there wanting, then, to make of New England a vast garden? Nothing, but contented labor, and intelligence to direct it—and that we have. Let all awake then, and try to improve to the best advantage, the natural advantages of the country—and we shall find, that far from any cause of discouragement, we are greatly favored.

To the cultivation of grain and potatos, we have

discovered (in late years) that the soil and climate are well adapted to the raising of wool, even of Merino; and in a wonderfully short time, all over the land, there are great sheep-folds. There are also manufacturers that employ all that wool, and much more; and provide us with comfortable and handsome clothing.

There are other mines yet unexplored. To the industrious and active, the prize most belong; and to them, we wish to point out the article of SILK, as one most deserving their attention. What is there, that the soil can yield, so rich as silk, that can be obtained with so easy a labor? Excepting the first raising and planting of the mulberry trees, all the work can be performed by women, children, and aged people. We are fully and sufficiently satisfied, that this noble article, may be made a staple of our country; and the advantages that would result from it, in a private and national point of view, are so important, that we cannot deny ourselves the satisfaction of devoting a few pages of this volume to that interesting subject—hoping that they may prove acceptable, and eventually, useful to many of our readers.

The raising of silk is not altogether novel in our land; many individuals in Massachusetts and Connecticut have attended to it for a number of years, with much advantage; and it is a fact fully established, that the soil and climate are congenial to the flourishing growth of the mulberry; and that the silk worms will thrive in New England, under proper management; as well as they do in most parts of Europe, where the raising of silk is the vital sinew of the community. Without any further remarks, we shall enter upon the subject, and set down, first, such practical information as relates to the raising of mulberry trees.

The mulberry and the silk-worm are natives of Asia. They were both unknown in Europe until the year 555—when the emperor Justinian sent two monks to Serinda, in India, from whence they brought to Constantinople, the seed of those precious insects, and the necessary information for their management. Thus they laid the foundation of those superb silk manufactures, which for near seven hundred years, flourished in Greece, at Athens, at Thebes, and Corinth. Before that time, the great of the earth, alone, could afford to clothe themselves with silk; the price of which was weight for weight in gold. About six hundred years after, the culture of silk was introduced from Greece, into Italy; and from thence into France, in the year 1494. Since those days, it has spread over all the southern and midland parts of Europe, and is now cultivated with success, as far north as Prussia, where the mulberry tree resists the most rigorous winters without injury.

There are two different species of mulberry, the *black*, which is cultivated for its excellent fruit, of a dark crimson color, almost black; and is a tree of slower growth than the white; the leaves are larger, of a darker green, thicker and stronger. The silk-worms will eat them for the want of better, but they do not thrive upon them, and the silk is coarse and inferior. The *white* mulberry tree bears a white, or light pink fruit; and its leaves are the most congenial food for these precious insects; is of a quicker growth, and does not come

to so large a size as the black. The white mulberry is a very hardy tree, and bears our severest winters without any apparent injury; will last twenty many years. If it be cut down close to the ground, will send up many suckers all around, and resist destruction for many years. There are many kinds of white mulberry, the leaves of which differ in point of merit as a food for the silk worm. Some are of a small size, earlier, and more tender; and, on that account, are cultivated as the most proper for the worms when first born; the others are large, of a peculiar quality, which suits the taste of the worms, upon which they thrive best, and make the handsomest silk. In France and Italy, they universally graft the wild stocks, with those sorts which experience has taught them to be the most valuable.

At this early stage of the business with us, it would be difficult to attain at once, the nicety which a long practice has introduced in the old countries. What we have to do for the present, is to sow mulberry seed, raise the young plants as in a nursery, reject those whereon thorns appear, as being the wildest, and bearing the smallest leaves; also those that have thick, coarse, hairy leaves. Save those that have the largest and handsomest smooth leaves; the worms eat them more readily, and experience has shewn that they thrive best upon them, make more silk, and of a better quality. The best plants for carliness and superiority of leaves, should be set out and noted, as they may hereafter furnish arions for grafting. Upon dry soil, the mulberry trees do not grow much taller than our largest peach trees; but they are stouter and thicker set. Their roots, which are of a remarkable bright color, (that of silk) extend to a considerable distance; and they ought not to be planted, on that account, nearer than thirty feet from tree to tree.

As the gathering of leaves, too soon, would injure their growth and constitution, we would recommend that no leaves should be gathered until after the fifth year. In the mean time plantation may be made for immediate use, by sowing the seed in drills, at a convenient distance; planting beans or potatos between, to keep the ground clear of weeds. The second year after sowing, these seedlings might be cut down with a sharp instrument, three or four inches from the ground, and would give a second crop the same season. In the silk countries, they raise seedlings in rows for the first feeding of worms. These young plants putting out their leaves earlier than the old trees, and being more tender, are better adapted for the worms in the first stage of their existence. They also plant the mulberry trees, and suffer them to grow according to unrestrained nature, branching out from the ground. This is for the convenience of gathering the leaves more easily, and making a food stronger than the seedling. They consider the leaves from trees regularly trained, with a single butt, and of several years' growth, to give the most substantial food; upon which the worms should be kept during the last period of their life, previous to their ascending, in order to obtain an abundant crop of silk of the best quality. At our first entering on this new, and profitable business, we shall be under the necessity of trust:

ing wholly to our rows of seedlings, as the only food, we can offer to the worms. But when the trees planted out come to maturity, we shall adopt the more systematic way of feeding, which experience has pointed out as most favorable. Although with us, the despatch of cutting down the seedlings for food, instead of the slow process of gathering leaves, will always remain an object of serious consideration.

The white mulberry thrives in all soils and situations, and will grow very rank and full of leaves upon low moist ground; but the food it affords in such situations, is very inferior and apt to disorder the worms. A warm loam, even if gravelly, will give leaves of the best quality; and a sheltered, warm situation will produce leaves many days sooner than one which is exposed to cold, and is desirable on that account.

The mulberry tree may be raised from suckers, and sometimes slips stuck in a moist soil, will take root; if the low branches of a tree can be bent so as to be fastened, and covered in the ground they will take root. The trees may be planted near buildings, for shade, or in a yard; the fowls are very fond of the fruit when it falls. A variety of situations will increase the means of early and late feeding which is very desirable.

We shall conclude these remarks on the cultivation of the mulberry, by observing, that the most esteemed seed of that tree in Europe, is that raised in Piedmont. The seed from Spain is also excellent. But the best quality of seed is large, bright, and heavy; and when bruised it will appear oily, and when thrown on ignited coals it will crackle.

The next object to consider, is the *seed from which the worms are to be hatched*; and here it will be proper to observe, that one ounce of seed will produce about forty thousand worms, who will consume about one thousand lbs. weight of leaves, and produce from eighty to one hundred pounds of cocoons; and twelve pounds of cocoons will give about one pound of silk. It is important to procure the best seed, because that which is inferior, will produce sickly worms, who will be much more exposed to the various disorders to which these insects are subject; a greater proportion will die, and those which survive, will not make good cocoons. The best seed is of a dark grey color, almost as dark as slate, looks bright, and if thrown into wine will sink. Those which are light, of a white or yellow color, and look dull, are barren and good for nothing. The seed should be kept in a cool, dry situation, until the mulberry trees have their leaves opened; when the food is thus in readiness then is the time to get it hatched. In Italy and France, at that appointed time, the women put the seed in small bags of worsted stuff, and place them in their bosoms, during the day, and at night under their pillows, for about forty-eight hours; at the expiration of which, the seed is transferred into boxes, over which a paper cover is fastened with many small holes, through which the little worms will creep. Some mulberry leaves should be placed on the paper so that they may feed, which they will do, as soon as they come to life. These boxes are placed on leather beds with pillows around them, in order to keep a uniform heat whilst the worms are hatching. Those which come to life in the course of the same day, should be collected and kept together; they will shed their skins, and ascend to make their cocoons, at the same period. The

hatching of each successive day should be kept separate; this order will render the management and care easier, and more profitable. When the hatching has been well conducted, the heat proper and regular, most of the worms will make their appearance on the third or fourth day; and such seed as has not come to life on the 5th or 6th day, is not worth preserving; for if it should hatch the worms will be weakly, and not likely to do well. If on the second day, the seed that has been set to hatch should change color, and appear red, it proves that the heat has been too great, and that the seed is spoiled.

In the middle provinces of France, where the climate is variable, and subject sudden returns of cold, the cultivators are very cautious occasionally to exclude the outward air, by shutting the doors and windows, always, in the night and early part of the morning. Sudden cold, dampness and especially, foggy weather, are sure to injure the worms by bringing disease upon them, which will often prove fatal, and always reduce the quantity and injure the quality of the silk. A uniform temperature, not too warm, is considered as very desirable for the success of the silk crop; and about seventy three degrees of the thermometer of Fahrenheit is the most suitable.

The silk worms shed the skin four times, which is for them a period of sickness; and, during which, they do not eat, but appear drowsy, and are more particularly affected by sudden changes of the weather to cold or dry. The first shedding takes place the 6th or 7th day after their birth; the head appears to increase in size. This time of trial, will last three or four days, if the weather is warm and genial; but if otherwise, much longer. As soon as the skin is cast off, they appear active again, eat with a good appetite, and will continue so, for six or eight days longer, when the second shedding comes on under the same circumstances, and is succeeded by a third and fourth shedding. The second shedding is the easiest for them, and fewer die under the operation than during the first, third, and fourth. Eight days after the worms have got through the fourth shedding; and at the end of about six weeks from the commencement of their existence, they have arrived nearly to maturity, and are going to make their cocoons and reward the care that has been taken of them. They want then to go up to spin their cocoons, but it is necessary not to encourage this natural disposition, until it is evident that they are fully ripe. If they go up too soon, their cocoons will be light and flimsy. The signs of their full maturity, are some change in their color, which until then is white; the head appears wilted, the tail larger, the green circles round the body become a bright gold color, and they keep moving about among the others, but without eating, and seem as if stretching their heads for the purpose of spinning. When the worms exhibit these indications, they should be separated from the rest, and put into a place where small dry branches of oak, hazel, white birch, or any other wood, have been prepared for them to ascend and spin their cocoons. When they have ascended, it will be some days before they begin to spin. The first day, they lay out threads for a foundation—the second, they form the shape of the cocoons—the third, the worm is entombed and out of sight; but continues to spin, (inside) until he has expended the whole of his stock of liquor, which in general, is the seventh or eighth day. The thread

of a good cocoon is about nine hundred and fifty feet.

(Concluded next week.)

FOR THE NEW ENGLAND FARMER.

Mr. FESSENDEN.—Fioding a leisure moment, this afternoon, I took up the yesterday's number of your truly useful paper. The first article which met my eye was one, "On the Effects of the Protecting System upon the Agricultural Interest," taken by you from the American Farmer. This article appears to have been written by "Samuel Wyllis Pomeroy," of "Brighton, near Boston."—Having read through what the writer has chosen to say of himself and his own affairs, with which I have nothing to do, I come to what was intended for the *substantial* part of the performance; viz. a statement of the history of the "Protecting system," and an argument, founded on that statement. It is here that I shall begin my observations on the treatise.

Mr. Pomeroy says the first impost on cheese, "of four cents a pound, was laid in September, 1790. Foreign cheese was considered a *luxury*, and was taxed as a fair object of revenue. The preamble to the act which contains this item recites "To make provision for the payment of the debts of the United States." "Revenue," he further observes, "was the only object—no one ever dreamed that it was for the *protection* of a particular class of citizens. The discovery that Congress possessed the power of imposing prohibitory tariffs was reserved for more evil times. This is an *evanescence* that has attached to the constitution since that period. Had it appeared then, every hand of those illustrious patriots who organized the government would have been put forth to pluck out the *constructive* tumour by the roots.— They would have pronounced, most emphatically, that "the state legislatures were the only legitimate almoners of the *people's* money."

The shortest and most effectual mode of correcting the above mis-statement of the early history of the protective system in this country, is to quote, verbatim, the titles and declaratory parts of the first acts of Congress on that subject; which I shall here do, for the information of Mr. Pomeroy and your other readers.

The first act on the subject, and the first *business* law made by Congress under the present constitution, was "An Act for laying a duty on goods, wares and merchandizes, imported into the United States," which says, "Whereas it is necessary for the support of government, for the discharge of the debts of the United States, and the *encouragement and protection of manufactures*, that duties be laid on goods, wares and merchandizes imported." Approved by Washington, July 4, 1789. This act imposed a duty of four cents a pound on imported cheese.

The second act on this subject was that for "making further provision for the payment of the debts of the United States." Approved by Washington, August 10, 1790. This act recites, that, "Whereas by an act for laying a duty on goods, wares and merchandizes, imported into the United States, divers duties were laid on goods, wares and merchandises, so imported, for the discharge of the debts of the United States, and the *encouragement and protection of manufactures*: And whereas the support of government and the discharge of the said debts render it necessary to increase the said duties." By this act the duty of

four cents a pound, on cheese, imported, was continued.

Now, sir, let Mr. Pomeroy and your other readers, compare the laws, as they may be found in the statute book, with Mr. Pomeroy's statement. The mere inspection will be sufficient for my purpose; and comments would be superfluous!

On reading Mr. Pomeroy's communication to its conclusion, I find that there is nothing more in it, which requires animadversion. If he chooses to take the *anti* tariff bill, now before Congress, as a specimen of what is wanted by the *true* friends of the "American System," and to deprecate the details of that bill, his supposition is erroneous, however well directed may be his objections.

Providence, April 12, 1828.

W. E. R.

FOR THE NEW ENGLAND FARMER.

Mr. FESSENDEN,—I learn with regret that Major Jaques has lost the celebrated bull *Cælebs*.—This I consider not only a heavy loss to the enterprising owner but a loss to the public, believing it will not be an easy matter readily to supply the place of that fine animal.

If sir, "he who contrives to make two spires of grass grow where but one grow before be entitled to rank with the benefactors of mankind;" it follows, that he who contrives to make one spear of grass produce as much beef or as much milk as two did before is entitled to the same distinction. I am not so visionary as to believe this advantage can ever be fully realised; much however, has been done, and much more may be done, tending to this result.

I am surprised at the apathy of our agricultural brethren on this subject, and the indifference so manifest in the community generally towards our agricultural societies. The advantages which have and must continue to accrue to the public from the operations of the Massachusetts Agricultural Society, are incalculable. The public spirit of the founders and liberal supporters of this institution is in my opinion by no means duly appreciated; succeeding generations while reaping the fruits of their labors will bless their memories as public benefactors.

Among the objects of this Society improvement in the breed of stock I believe is, and I think deservedly so, one of the most prominent. In this pursuit the gentleman above mentioned appears engaged heart and soul, so far as his location and facilities admit, but these compared with his activity and perseverance are quite limited. It is much to be desired that his zeal should be exerted in a field commensurate with his abilities, and we have no fear that it would not be as beneficial to the public as satisfactory to himself.

A FRIEND TO IMPROVEMENT.

FOR THE NEW ENGLAND FARMER.

Mr. FESSENDEN,—Having seen pieces occasionally in your very useful "New England Farmer" on the subject of Peas, time of planting same for preventing bugs, &c. I will mention a very simple plan I have for several years adopted, so many that I begin to think it originated with me—Immediately before planting I put the peas in a tub, and pour very hot water on them, keep stirring for one or two minutes, and have cold water at hand to pour on sufficient to cover them one or two inches, leaving it not more than blood warm, for one or two hours before planting, in which time they

will swell considerably and come up much sooner; all the bugs will be destroyed and found floating on the top of the water. In fact I have very few, and verily believe, if the plan was universally adopted, we should not hear any more about buggy peas; but if here and there a slovenly neighbour should neglect this rule, the flying weevil would pass from his field, to his more careful neighbours as readily, as the miller from the neglected apple and wild cherry trees to the better attended ones of his neighbours, depositing the eggs of the caterpillar for the next year. P.

FOR THE NEW ENGLAND FARMER.

TEAZELS.

Mr. FESSENDEN,—For the information of your Bristol correspondent, who inquires respecting teazels in your last paper, I send you the following, derived from persons who for a number of years have cultivated them on farms in my neighborhood: They thrive best in a deep loamy soil; the ground is made mellow by 2 or 3 ploughings and well harrowed. The latter part of April the seeds are sown in drills, twenty inches apart; and thinned in the drills to 1 foot distant; must be kept free from weeds until autumn, when the plants are slightly protected during the winter by some coarse litter. In the following spring they are to be uncovered and the weeds kept down until the latter part of the summer, when the head will be ripened and must be picked as they turn brown and thoroughly dried.

It sometimes happens, that a part of the plants do not produce heads the second year. Such plants they remove into a bed by themselves, and they produce a crop the third year.

The following is extracted from M^{rs} Mahon and agrees in substance with the foregoing:

Dipsacus fullosum, or Foller's teazels. This plant is propagated by sowing this seed in March or April, upon a soil that has been well ploughed. It is observed that good wheat land is well adapted for the production of teazels. From 1 to 2 pecks of seed is sown upon an acre, and harrowed in with a light harrow. When the plants are up, hoe them in the same manner as practised for turnips, cutting down the weeds and singling out the plants to six or eight inches. Hoe them a second time, cutting out the plants to about one foot asunder, and keep them free from weeds.—The second year the plants will shoot up stalks with heads which will be fit for collecting in August, observing that they are to be collected as they turn brown and ripen.

A RHODEISLANDER.

North Providence, April 14, 1828.

FOR THE NEW ENGLAND FARMER.

MANAGEMENT OF DAIRIES IN DEVONSHIRE, ENGLAND.

"The milk is put into tin or earthen pans, holding about ten or twelve quarts each. The evening's meal is placed, in the following morning, and the morning's milk is placed in the afternoon, upon broad iron plates, heated by a small furnace, or otherwise over stoves, where, exposed to a gentle fire, they remain until after the whole body of cream is supposed to have formed upon the surface, which being gently removed by the edge of a spoon or ladle, small air bubbles will begin to rise, that denote the approach of a boiling heat, when the pans must be removed off the heated

plate or stoves. The cream remains upon the milk in this state, until quite cold, when it may be removed into a churn, or, as is more frequently the case, into an open vessel, and there moved by a stick about a foot long, at the end of which is fixed a sort of peal, from four to six inches in diameter, and with which about 12 lbs. of butter may be separated from the butter-milk at a time.

"The butter in both cases, being found to separate much more freely, and sooner to coagulate into a mass, than in the ordinary way, when churned from raw cream that may have been several days in gathering; and at the same time will answer a more valuable purpose for preserving, which should be first salted in the usual way; then placed in convenient sized egg-shaped earthen crocks, and always kept covered with a pickle made strong enough to float and buoy up about half out of the brine, a new laid egg. This cream, before churning is the clouted cream so much celebrated in Devonshire. Although it would be reasonable to suppose, that the scalding of the milk must have occasioned the whole of the oily or unctuous matter to form upon the surface, still experience shews that is not the case, and that the scalded skimmed milk is much richer and better for the purposes of sucking, and makes far better cheese than the raw skimmed milk does.

"The ordinary produce of milk per day, for the first twenty weeks after calving is three gallons, and is equal to the producing of a pound and a quarter of butter daily, by the scalding process. The scalded skimmed milk is valued at 1½d. per quart, either for cheese making or feeding hogs. The sum of the trials, procured to be made on the milk in several parts of this district, gives an average of twelve pints of milk to ten ounces of butter. When cheese is to be made (but in which manufacture there does not appear to be any superior excellence in Devonshire,) great care is taken that the milk is not heated so far as to produce bubbles under the cream.

"Although these statements will be found considerably short of the average produce from cows of a larger size, and probably much better adapted for the pail, still there are not wanting instances of what must be regarded as extraordinary produce among the North Devon cows.

"In the neighbourhood of Molland Boucaux, a single cow, judged to be rather less than eight score per quarter, within three weeks from the time of calving, yielded, in seven successive days, seventeen pounds and a half of butter; several of the meals of milk were measured during this time, which gave an average of fourteen pints per meal: instances also occurred in other parts of the district of two pounds of butter per day being obtained from cows within a short time after calving; and it is particularly clear in the recollection of a gentleman in the neighbourhood of Bishop's Tawton, that some years since a cow of the common red breed, after her second or third calf, which she had between Michaelmas (27th Sept.) and Christmas yielded, without any particular attention being paid to food or treatment, during a considerable time of the ensuing winter, two pounds and a half of butter per day; this cow living at the time in common with the other dairy cows, which were permitted in the day time to range over all the old pasture grounds, and regularly foddered morning and evening with hay in the same field."—*Vancouver's Survey of Devonshire.*

(From the New York Farmer.)

ON THE IMPROVEMENT OF PASTURES.

By J. Buel, Esq. of Albany.

I shall consider them under the two following heads:

1. Those in which the plough is altogether excluded, which may be called *permanent pastures*—and,

2. Those which intervene in alternate husbandry, and which may be denominated *temporary*.

The first comprises lands which are too stony, too wet, or too hilly, for tillage, and sometimes river alluvians. The latter are less frequently depastured here than in Great Britain. They are considered necessary to *fatten*, while the hilly uplands are appropriated to *rear and to feed* neat cattle. Their superior value with us, for hay, in situations accessible to large towns, has generally confined pasture upon them to the aftermath.

The advantages of old pasture grounds are very highly valued in Great Britain. They contain a greater variety of grasses, and yield a much greater quantity of food, than those which have been recently laid down. The food is believed to be also more nutritious, as the sods is found to abound in the four native grasses, which, on account of the little product they yield in hay, are not so commonly sown as those which afford bulkier products. Grasses do not grow alike; some start early and afford a good bite in spring; some are more luxuriant at midsummer; and others again afford nutritious herbage in autumn and winter. Old pastures contain more or less of each, and consequently give a succession of fresh food. They are truly perennial. Their value, other circumstances being similar, is in proportion to their fertility: for vegetables, like animals, require food for their development and perfection, and thrive in proportion as this is abundant and nutritious.

When pasture grounds are wet, the first object should be to drain them thoroughly. *Wet* grounds produce coarse grasses, which smother the finer kinds, and become poached by the feet of cattle, till the sod is partially or wholly destroyed. *Moist* grounds, on the contrary, produce the greatest variety and most nutritious quality of grasses.

The extirpation of bushes, thistles, dock, and other useless plants, although but seldom or partially attended to, will well repay the labour in the increased quantity of feed, to say nothing of the appearance of neatness which it gives to grounds. By this, I do not mean to exclude trees, either single, in clumps, or in belts upon the borders. These afford shade, shelter, and fuel, without materially injuring the pasture. Where the common locust is exempt from the depredations of the worm, it may be raised in this way with great profit. I have been much pleased with the attention which has been paid to this subject in Pennsylvania, and in the southern parts of this state. Belts of forest trees are peculiarly serviceable in protecting winter crops from the severity of cold.

Manuring pasture grounds, otherwise than by the droppings of cattle that are fed upon them, is a practice that has few or no followers among us; and yet it might be done with as much advantage here as in other countries. But for this purpose, I would not recommend cattle dung, but road alluvian, swamp earth, and composts. The best and cheapest top-dressing for pastures as well as meadows that I am acquainted with, with the ex-

ception of plaster of Paris, is what the Scotch call middens, or Lord Meadowbank's compost middens. It is composed of about three parts swamp earth, and one part fresh stable dung, placed in compact alternate layers, to the height of four or five feet, and suffered to remain until incipient fermentation pervades the mass. The swamp earth I speak of is the black vegetable matter, which has accumulated in bogs and wet grounds, and which is often insoluble, and unfit for the food of plants, until decomposition has been begun by the aid of hot dung, lime, or other extraneous agent. I have made this compost with success, and applied it with profit. It is a cheap method, when the materials are at hand, of trebling or quadrupling manure, for all the purposes of husbandry. It should be applied to grass grounds in autumn.

Scarifying or harrowing pastures in the spring, which are what is termed *hide bound*, is a good remedy for the evil, and serves to extirpate masses, which are the bane of the finer grasses. Seeds may be scattered previous to this operation with certain advantage. Heavy rollers are also used with benefit, as early as the sole of the grass is solid enough to sustain the weight of cattle. It reduces inequalities occasioned by frost, and presses the earth to the collar and roots of the plants.

2. In preparing new pastures, the rule should be, to endeavor as far as possible, to make them resemble old ones. And this is best effected by sowing seed of all the esteemed varieties found in old pastures. On this head our practice is very defective: two kinds being the greatest extent to which our experiments have been carried. I have read some interesting experiments made at Woburn by Sinclair, on this subject; but as the book is in the hands of a friend, I can only quote from recollection. This indefatigable experimenter counted the number of plants upon a given surface of rich old pasture, and upon a like surface of new pastures, sown with from two to ten or a dozen kinds of grass seeds. The old sod supported about 11,000 plants; on the new the number varied, I think, from about 700 to 75, and was found to be nearly in the ratio of the number of grass seeds sown. The weight of the produce cut at the proper season, corresponded somewhat with the number of plants. The deductions from these facts were, that by sowing a great number of kinds, and an abundance of seed, new pastures might in two years acquire nearly the value of old ones: for though a given space would grow but a certain number of *one* variety, yet that the same space would support more than double that number of *several* varieties; and that consequently *many* would afford much more forage than *one* or *two* varieties on the same surface.

These deductions correspond with the established maxims of natural philosophy. All plants take from the soil food which benefits all; yet every species requires for its development and perfection, something peculiar which other species do not imbibe. And although the soil contains only enough of this peculiar nutriment to support a certain number of plants of one species, yet it may abound in the peculiar nutriment of others. But I need not resort to abstruse science to illustrate what is apparent to every intelligent farmer. Our system of rotation of crops is based upon this law of nature; and we see it confirmed in the alternations which are constantly going on in our fields and forests.

Our seed shops do not afford any great range in

the selection of grass seeds. But we are better off than we have been; and if farmers consult their true interests, we shall soon find new varieties imported, and more care bestowed in collecting the seeds of valuable indigenous kinds. At present we can obtain seeds of the tall oat grass, (*Avena elatior*), the orchard grass, (*Dactylis glomerata*), Timothy (*Phleum pratense*), herd grass (*Sigragis stricta*), and white and red clover, (*Trifolium pratense* and *T. repens*.) These are all suitable for pasture grasses. The Poa pratensis, P. trivialis, P. compressa, (rough and smooth stalked meadow and blue grasses,) the Agrostis alba, white top or fowl meadow,) the Holcus lanatus, (meadow soft grass) some of the Festucas and several of the Agrostis families, are indigenous, and come in spontaneously, to soils adapted to their growth. The seeds of meadow foxtail, sweet scented vernal grass, and the fescue, may be obtained from Great Britain, and would be valuable accessions to our pasture grounds.

SWEET POTATOS.

Directions for the preservation of the slips of the Sweet Potatoes, and for their cultivation.

The Slips are nothing more than the small potatoes or roots *last* thrown off by the plant. They are preferred to larger ones on the several grounds of economy, of food and of room—of their being more easily preserved, and less likely to rot in the ground after they are planted. The writer of this, during fifteen years, never succeeded in getting more than one large sweet potato to vegetate or grow in the open ground. The ignorance of the mode of culture has probably been the cause of their not having been raised here.

The slips should be put up for preservation without *bruising* them (or as the directions from New Jersey expressed it, they should be handled as carefully as eggs) in a dry state, in *perfectly* dry sand or earth, and kept in a warm place as free as possible from moisture.

Those who wish to be perfectly assured of their success, will raise a small hot bed with, or without glass about the 10th of April, on the south side of a fence, wall or building. On this, they will lay the slips or roots so close as to touch each other, so that a bed of six feet square will be sufficient for a bushel of them. They should then be covered with about an inch of earth. If the cultivator has no hot bed frames, the bed at night may be covered with a mat or with straw.

In 10 or 14 days some of the shoots will appear above ground; when about one half or even a third so appear, they are all to be taken up to be planted. The lightest soils are best adapted to them. As their roots almost universally strike downwards, like those of the carrot, they are always placed on hills *raised* about nine inches, or about the height of a potato hill, after its *last* fruitful hoeing. These hills should be four feet and a half apart in every direction. The slips, two in each hill, one foot apart, are then put in either with the fingers, or a stick, or any instrument capable of making a sufficient hole, and the crown or top should be within an inch or half inch of the surface. When thus started or sprouted, it will be easy to distinguish the end which sends out roots, from that which puts forth shoots for the open air. The slips should be put in perpendicularly or nearly so, the *root end* downwards. They would grow without this precaution, but would be delayed and injured in their growth. A little dung

dog, or heed in will much aid their progress, unless the land be rich. They cannot bear moist, or any rich grounds, or places, where the water stands, after showers. Their vines grow too luxuriantly in such situations, and their roots are softer and more watery.

After they are planted they require the same treatment as the squash or pumpkin, that is simply weeding them. In the Jerseys, they raise the runners from the ground when they weed them—so as to prevent their taking root, which they do more readily than any plant, and which the Jersey farmers think injurious to the main roots. The subscriber permitted nature to take its course—but he should certainly make the trial another year of the New Jersey method.

The products for two successive years, have been at the rate of 229 bushels to the acre, with no greater care, nor indeed so much as that bestowed on common potatoes. They were planted this year early in June, and were killed on the 10th of Oct. which is at least forty-five days less growth, than they would have in common years, or if the seed had arrived earlier. They will begin to be palatable and fit for table about the 15th of Sept. or 1st of Oct.—as the season may have been hot or cold; but the general crop ought not to be dug till the vines are killed. They will endure six or seven frosts after the common potato stalks have been killed. So many persons have applied for slips, that it was the advice of some of them, that these hints should be published. It is not pretended that the culture is of any agricultural importance—it is merely an horticultural experiment, very pleasant to those who have a taste for such pursuits—and also gratifying to those who love the sweet potato. They certainly can be raised here of excellent quality, full as often as we can raise good grapes, peaches, or pears. They should not be gathered in by the hoe, or spade—they must be raised like the carrot, with the dung fork. J. LOWELL.

The following additional remarks are from the Massachusetts Agricultural Journal.

CAROLINA, OR SWEET POTATO.

This plant is not a potato, though there is a vulgar opinion, that the common potato transplanted to southern regions becomes sweet, and that the sweet potato on being carried to northern climate degenerates into the common potato. The common potato is what the botanists have named a solanum. It is not a running plant. Its native country is probably the high lands of South America—a cold region. It delights in cold seasons, and a moist soil, and it is a fact, that it is drier and more mealy, when raised in such soils, than in dry ones. The best potatoes known are raised in wet, flat and almost overflow ground of Lancashire in England; and in Ireland, so famous for its moisture and verdure, as to have received the appellation of the Emerald Isle. It flourishes admirably in the fens of Nova Scotia and the lower parts of the State of Maine. The sweet potato has no title to be called the Carolina potato. It is an exotic, or foreign plant with them. It is a native of tropical regions—has been gradually introduced northerly, like the Lima or Saba, commonly pronounced Civet bean. The sweet potato is not a solanum, but a convolvulus—has all the habits of the tribe of the convolvulus—it is a running or creeping plant. It never flowers in our country—is very hardy—capable of bearing more frost than the common potato, and in

wet seasons it is watery and less sweet. It may prove my great zeal, and somewhat theoretical turn, to recommend the culture of this vegetable in Massachusetts, but four years' experience have given me some right to speak of it practically. I recommend its culture on the following grounds:—1st. It will grow and succeed here under ordinary culture. 2d It is very prolific, making as good returns as the common potato. 3d It is preferred by man, bearing usually a price three times as great with us as the common potato. 4th It is preferred by all animals of whatever description. Cows and pigs eat it greedily, and even dung-hill fowls will attack and consume it in a raw state. It will produce about 250 bushels to the acre. I have never failed to raise it with success. The only impediment to its culture is the difficulty of preserving the small tubers or roots; but as soon as it is known that there will be a demand for them, our market will be regularly supplied from New Jersey, where it has been long naturalized. It can be as easily raised as cabbages. This I undertake to affirm.

JOHN LOWELL.

Salmon Trout.—A fish of this species, weighing twenty-three pounds, was caught in Schoodic lake which empties into the Piscataqua, at Kilmarnock, and sold in this town a few weeks since. Soon after, Messrs. Colby and Chick, made a tour to the lake and caught fifteen of the same species—the largest of which, weighed ten pounds. Last week Mr. Chick and others caught thirty; the largest weighing twelve pounds.—*Bangor Reg.*

The Legislature of New York, has before it a bill to grant a bounty on New-York salt sent down to Albany and the seaports.

Also a bill to encourage the growth and manufacture of hemp and flax—and a bill authorizing a loan of \$1,000,000 for the Chenango Canal.

Potato Pudding.—One pound of butter, one do. of sugar, beat to a cream, two pounds of potatoes boiled and pressed through the colander, twelve eggs, one glass of brandy, one of wine, half a glass of rose water, one teaspoonful of spice.

Mohawk and Hudson Rail Road.—The Albany Advertiser says:—"We are happy to state the amendments to the bill to incorporate the Mohawk and Hudson Rail Road Company have at length passed into a law. It will be remembered that in 1826, General Van Rensselaer, Mr. Featherstonhaugh, and their friends, were incorporated with an exclusive privilege for fifty years, to occupy, by a rail road, the communication betwixt the Erie Canal near Schenectady and the city of Albany. This communication was deemed to promise such great results, that the legislature reserved to the state the right to purchase it of the company within five years of its completion. They also made the stockholders personally liable for the debts of the company.—The company upon mature consideration, refused to construct the road with these restrictions, and applied this session to be released from them. The law accordingly has been amended: the personal liability clause being repealed the company is to have exclusive possession of the profits of the road for the first ten years after its completion; and during the five years succeeding the ten, the state reserves to itself the right of purchasing the property of the corporation, upon payment of the original cost, repairs, expenses of every kind, fixtures and ap-

purtenances, with 14 per cent per annum. This is the most valuable charter ever granted in this country. The immense increase of transportation, both of property and persons on this route, continually advancing in amount, baffles all calculation as to the future operations of this rail road.

Horse butcheries.—Near Paris is a number of horse butcheries, at two of which 14,775 worn out horses were slaughtered in one year. Every part of the animal is turned to some account. The mane and tail are sold to the upholsterers, the skin to the tanners, the meat to the owners of cats and dogs; the small intestines are manufactured into cords, the hoofs into combs, and the bones into knife handles, fans, &c. These establishments are infested with innumerable rats, which are caught and killed for their skins. More than 2,600 have been killed in a single day. The rats make nothing of devouring the whole carcass of a horse (except the bones) if left exposed, during a single night.—*Hampshire Gaz.*

In travelling through Worcester county, Mass. we have been surprised to see such a number of broad rimmed wheels. At Boston we observed a number of new stages with similar wheels. On enquiry we learnt from the most respectable authority that such wheels were coming gradually into use, and were decidedly preferred by those engaged in transporting by land. Three teams were rising a muddy hill with equal loads and an equal number of horses. The forward teamster laid his whip on his arm and walked behind his wagon. The second applied his whip with full force—and the third had put his shoulder to the wheel. The foremost wagon had broad rimmed wheels—the two others narrow rims. One of the principal carriers in Norfolk county, Mass. has adopted such wheels, and after years of trial says, that he would prefer to pay for broad rimmed wheels, in preference to using the best narrow rimmed wheels if furnished free of expense. The broad rims have a decided advantage on sand, and soft ground. They are in general use in England. It is calculated that a general use of them will save one half the expense of repairing highways, which in Massachusetts is computed to be nearly \$500,000 a year. The legislature of that State, convinced by ample experiments of many intelligent farmers, and carriers, have passed a law requiring that all carts, wagons and stages, built after two years, shall have broad rimmed wheels, the lightest not less than four inches, others five inches broad.—*Southern paper.*

Cotton seed whiskey.—The people of Georgia have discovered that whiskey can be obtained from cotton seed; another poisonous liquid is therefore to be added to those which are now ruining the country. This new whiskey has a villainous smell, but it makes the toppers "squabble, swagger and swear," and will of course be swallowed.—*ibid.*

Legs.—A person confined to the bed a week by sickness, has generally to remark a much greater wasting of the legs than of the arms; the reason of this, is, the muscles of the leg in ordinary cases, being more in use than those of the arms, have their usual bulk so much owing to this, that they suffer a greater change from inaction than others, which have a certain magnitude independently of use.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 18, 1828.

CANKER WORMS.

We shall not attempt to give either a description or the natural history of the canker worm, but refer to Professor Peck's Memoir on the subject: [which was originally published in the Massachusetts Agricultural Repository—and republished in the New England Farmer, Vol. v. page 393], and direct our attention, exclusively, to the remedies, which have been used, or suggested to preserve fruit trees from this formidable enemy.

The female of this insect, comes out of the ground late in the fall, early in the spring, or sometimes, during a period of mild open weather, in winter. Those which rise in autumn or in winter are less numerous than those which ascend in spring; but being very prolific, they do much injury. One method of preventing the ravages of the worm is to bar the ascent of the females up the stem of the tree. This has generally been attempted by *tarring*, of which there are several modifications.

First, A strip of linen or canvass is put round the body of the tree, before the females begin their ascent, and well smeared with tar. The insects, in attempting to pass this barrier, stick fast and perish. But this process, to complete the desired effect, must be commenced about the first of November, and the tarring continued, [when the weather is mild enough to permit the worms to emerge from the ground,] till the latter end of May, or till the time of their ascent is past. It is necessary to fill the crevices in the bark with clay or mortar, before the strip of linen or canvass is put on, that the insects may not pass under it.—Having put on the strip, which should be at least three inches wide, draw it close, fasten the ends together strongly, then tie a thumb rope of tow round the tree, close to the lower edge of the strip. The design of this, is to prevent the tar from running down the bark of the tree, which would injure it. It should be renewed, in moderate weather, once a day, without fail. The best time is soon after sun-set, because the insects are wont to pass up in the evening, and the tar will not harden so much in the night as in the day.

Second, Another mode of tarring, is to take two wide pieces of board, plane them, make semi-circular notches in each, fitting them to the stem or body of the tree; and fasten them together at the ends, so that the most violent storms may not displace them. The crevices betwixt the boards and the tree may be easily stopped with rags or tow; then smear the underside of the boards with tar. The tar being defended from the direct rays of the sun, will hold its tenacity the longer—and therefore need not be frequently renewed. The trees, in this way, will be less liable to be injured by the drippings of tar, by leaving a margin of two or three inches, on those parts of the boards which are next to the trees, to which no tar is applied.

Third, Another mode of blockading the paths of the insects, in their ascent up the trees, is to inclose them with collars, or circular slips of tin. Of this method, we have seen some notices, but no description. We presume, however, that the pieces of tin are shaped and fitted to the trees, somewhat like the boards above mentioned; and, perhaps, if the outer rims of the collars were cur-

ved, or bent downwards, they might present obstacles, which the worms could not pass, even if no tar was applied. We fear that this method would prove too expensive for general adoption—but would solicit further information on this subject from those who have a practical knowledge of its application and results.

Fourth, Another method, proposed by Dr. Jeremiah Spofford, of Braintree, Mass. is to spread Mercurosal Ointment (*Unguentum Hydragryi*) upon strips of woolen cloth, or narrow lists, such as are cut from the edges of broadcloth, and apply them closely round the trees, having first made the bark smooth, where it is not so, that none of the grubs, or females that deposit the eggs, from which the worms are produced, may pass under the band or strip, which contains the ointment. Dr. Spofford observes, "that the advantages of using the unguentum over any mode in common use are obvious. While tar requires to be renewed every night, that it may catch and hold the grub, merely by its tenacity, this mode requires preparing but once a year, and will be growing stronger for a long time, by an increased oxydation of the mercury, when exposed to the air."

The Massachusetts Agricultural Repos. Vol. iii No. 4, contains some remarks on the cankerworm, by the Hon. John Lowell, president of the Massachusetts Agricultural Society, from which the following is extracted:—

"I had the turf dug in around sixty apple trees, and the earth laid smooth. I then took three hogsheds of *effete*, or air slacked lime, and stretched it an inch thick round my trees, to the extent of two or three feet from the roots, so that the whole diameter of the opening was four to six feet. I tarred these trees as well as the others, and although I had worms or grubs on most that were not limed, I did not catch a single grub where the trees were limed.

"I do not speak with confidence. I am, however, strongly encouraged to believe the remedy perfect. It was ascertained by Professor Peck, that the insect seldom descended into the ground at a greater distance than three or four feet from the trunk, and to the depth of four inches, or that the greater part comes within that distance. The lime is known to be destructive of all animal substances; and I have little doubt that it actually decomposes and destroys the insect in the chrysalis state, at least I hope that this is the case.

"There are many reasons, which should encourage a repetition of this experiment. The digging round the trees is highly useful to them, while tarring is very injurious. The expense is not great—a man can dig round fifty trees in one day. The lime is a most salutary manure to the tree. After the spot has been once opened and limed the labor of keeping it open will not be great. Three hogsheds of air slacked lime, or the sweepings of a lime store will suffice for fifty trees, and will cost three dollars. As it is done but once a year, I think it cannot be half so expensive as tarring.

"I repeat it, that I mention my experiments with great diffidence, as being the first of my own knowledge. It may induce several persons to try it in different places, and where trees are surrounded with others, which are treated differently. All I pray, is, that it may prove successful—and relieve us from this dreadful scourge, which defaces our country, while it impoverishes and disappoints the farmer."

The remedies proposed by Professor Peck, were *lat*. Turning up the ground carefully in October, as far as the branches of a tree extend—to half a spade's depth, or five inches, so as completely to invert the surface. A great number of chrysalids would thus be exposed to the air and sun, and of course destroyed. 2d. Breaking the clods and smoothing the surface with a rake, and passing a heavy roller over it, so as to make it very hard and without cracks. In grass grounds the sods should be turned with the grass side down, and placed side by side so as to be rolled. The winter's frosts would heave and crack a smooth surface, but it might be smoothed and hardened by the roller, or by other means in March, with much less trouble, time, and expense than rolling requires. As lime, when slacked is reduced to an impalpable powder and is thus well adapted to close the opening in the surface, Mr P. was inclined to think its good effects are produced this way as well as by its caustic qualities.

John Kenrick, Esq. of Newton, Mass. proposed, between the time in June after the worms had disappeared and the 20th of October to take the whole of the soil surrounding the trees, to the extent at least of four feet from the trunk, and to a suitable depth and cart it away to a distance from any trees, which the canker worms are in the habit of feeding on; and returning an equal quantity of compost or rich earth intermixed with manure.

A writer for the New England Farmer, Vol. iii. page 327, states a case of an orchard having been preserved from the canker worm, by means of a large number of locust trees, equal to about double the number of apple trees.

Mr. Roland Howard, of Easton, Mass. observes, that "a quantity of lime was collected from the sweepings of a lime store and sread on the ground around a certain apple tree, some time in the month of November, (the foliage of which had been destroyed by the canker worm the preceding summer) the ground being in a pulverized state, the lime was spread as far from the trunk of the tree as the drippings from the branches extended. The effect was stated to be the entire disappearance of the worm and an increased vigor of the tree." The same writer observes, that "moving the earth with a plough or hoe late in November, or beginning of December, has been found very efficacious in destroying them." This last mentioned remedy, if it always proves efficient, will probably be the cheapest and most expedient.—But the worm must be capable of enduring a considerable degree of cold, or unerring instinct would not lead it from its dormitory in November, (as it frequently does) to brave the rigors of winter on the stem or branches of the tree. We are inclined to believe, as well as to hope that the application of lime, as above stated, will prove effectual, and if so, it will probably be preferable to any mode of applying tar, or attacking the enemy above ground.

When the insects have ascended, their numbers may be lessened by jarring or shaking the body or limbs of the tree causing them to suspend themselves by the threads, which they spin from their bodies, and striking them off with a stick.—It is said that those which thus fall to the earth, do not rise again. Whether they would be able to resist the effects of a sprinkling with soap-suds, saline, or bitter infusions, &c. is more than we can say; but we wish their powers might be test-

MISCELLANIES.

WARM RECEPTION.

Rusticus wrote a letter to his love,
And filled it full of warm and keen desire;
He hoped to raise a flame—and so he did—
The lady put his nonsense in the fire.

The President's guard.—An Englishman speaking of the presidency of Washington, was expressing to an American a wish to behold him. While this conversation passed, "there he goes," replied the American, pointing to a tall, erect, and dignified person, on the other side of the street. "Is that General Washington?" exclaimed the Englishman, "where is his guard?"—"Here," replied the American, striking his osseous with emphasis.

Irish wit.—It happened, lately, in repairing the street in which Dr. Abernethy resides, that the paving stones were accumulated before his door. The doctor, rather angry, remonstrates with an Irish laborer, and the following dialogue took place:—

Dr. A.—Why the d—l have you laid your rubbish opposite my door where carriages are daily stopping?

Pat.—Farth, your honor, it must be hid somewhere, till the strate is mended.

Dr. A.—It may be so;—but it must not be laid there.

Pat.—Where can I put it at all, your honor?

Dr. A.—Put it in h—l, if you like.

Pat.—O be dad—I'd better put it in heaven; it would be more out of your honor's way.

A Profitable Tempest.—When Isaiah Thomas, proprietor of the Farmer's Almanac was called upon by a printer's boy to know what he should put against the 13th of July, replied "any thing;"—upon which the boy set "rain, hail, and snow." The country people were amazed at this; but it so happened that it actually rained, hailed, and snowed on that day, which proved a profitable storm to the proprietor of the almanac for the future numbers.

Why is a gardener the most extraordinary man in the world?

Because, no man has more business upon Earth. And he always chooses good Grounds for what he does:

He commands his *Thyme*, and is *Master of the Mint*.

He fingers *Penny Royal*, and raises his *Celery* every year.

And it is a bad year indeed that does not bring a *Plum*.

He meets with more *Boughs* than a Minister of State.

He makes more *Beds* than are in the French King's Palace.

And he has in them more *Painted Ladies* too.

He makes *Raking* his business, and not a *Disversion*, as many other Gentlemen do.

He finds it advantageous to his Health and Fortune, which few rakes can boast.

His wife has enough of *Lady's Love* and *Heart's Ease*, and never wishes for *Weeds*.

Distempers fatal to others, never hurt him;

He walks the better for the *Gravel*, and thrives most in a *Consumption*.

His greatest *Pride*, and the World's greatest wonder is, that he can have *You* when he pleases.

A Bull.—A lady wrote to her lover, begging him to send her some money. She added, by way of postscript, "I am so ashamed of the request I have made in this letter, that I sent after the post boy to get it back, but my servant could not overtake him."

Dr. Johnson said, that a man, by taking a second wife, pays the highest compliment to the first, by shewing that she made him so happy as a married man, that he wishes to be so a second time.

Persons employed in grinding needles are usually seriously injured, and become consumptive, by inhaling the steel dust thrown off in the operation. To prevent this, a magnet is now suspended over the wheel, which attracts particles and prevents all injurious effect. This is one of the many modern applications of science, to the purposes of humanity.

Mad Dogs.—About forty sheep have recently been bitten by a mad dog at Pennamaquan, which have been killed and burned by their owners; and in Dennyville, a number of animals, we understand, have also been bitten, within a few days, by a mad dog. In consequence of this, all the dogs that are seen in the streets, in Dennyville, are instantly killed.—*Eastport Sentinel.*

Improvement by plantation is at once the easiest, the cheapest, and the least precarious mode of increasing the immediate value, as well as the future income of estates; and it would be well for the lords of the soil to remember the exhortation of the dying Scotch laird to his son: "Be aye sticking in a tree, Jack: it will be growing whilst you are sleeping."

There are in the human body no less than 500 muscles, for the purpose of performing its various functions; but these are few compared to the number assigned to some minute animals; a particular species of caterpillar was ascertained by the naturalist Lyonet, to possess 4,000 muscles in the different parts of its minute body.

Cure for the dropsy.—The following article is from a most respectable source, and we strongly recommend it (says the Salem Gazette) to the attention of our readers:—

I am knowing to two extremely distressing cases of dropsy being suddenly relieved by means of the bark of common elder. One, a woman advanced in years, in the last stages of the disease; and the other a young woman who had been for eighteen months confined to her bed, (four last of which she was unable to lie down). Her strength was nearly exhausted;—but is now wholly free from the disease, and is recovering strength in a manner surprising. Other cases less aggravated have been cured by the same method. The receipt is, "take two handfuls of the green or inner bark of the white elder, steep it in two quarts of white Lisbon wine twenty four hours—take a gill of the mixture in the morning, fasting, or more if it can be borne. If more convenient, part in the morning and part about noon, on an empty stomach." The white pith elder abounds in Essex county—we have here two kinds, the white and black pith ed. The effect of the bark prepared as above, or the juice from the leaves, has been used with success when wine could not be procured; and it promotes all the animal secretions necessary to health, which is the cause of its salutary effect in

dropsy. Great debility will always follow the use of powerful evacuants, and the best medical writers now recommend nutritious aliment as the best medicine in every case of debility. The bark and leaves of the elder have been long known as powerful evacuants, and not esteemed unsafe. Yet caution is recommended in using the buds, as their effect is esteemed and has been found dangerous in some cases.

Rose Bushes and Grape Vines.

For sale at the House of SAMUEL DOWNER, in Dorchester, 20 hundred leaf Rose bushes—40 do. Provence, or Cabbage 10 do four seasons—50 do. Danask—30 do. Emgardly—5 do. Androm—25 do. Marble—10 do. Trianon—100 do. French—6 very large pots mostly Roses—sixteen years old, and in prime health—7 varieties Double Double—Single, &c. Lagerstomia Indica, or Grape Myrtle—50 of which are 21 years old—200 Grape Vines, (White Sweet water)—Snow ball Bushes—White Lilies—Red and White Lilies.

ROSE WATER.

20 Demijohns Double and Single distilled Rose Water, made entirely from Danask Roses. The above Rose Water is constantly kept for sale at Mr. C. Wade's Porter Cellar, No. 12 Merchan's Row, by Demijohns of less quantity.

March 14

Engrafting and Garden Work.

REPEL HOWE, of Dorchester, informs his friends and the public, that he will attend to the engrafting of Trees, or Garden work. Having had considerable experience, he thinks he can give satisfaction to those who employ him with employment Reference can be had of Mr. Samuel Downer, of Dorchester.

April 4

40,000.

For sale, Forty Thousand State APPLE TREES, from two to four years from the graft—consisting of forty-three kinds of the most approved and superior Fruit; including early autumn and winter Apples. Also, other Fruit and Ornamental Trees. Orders may be sent to this place via Post office, directed to FRANCIS WINSHIP.

Bristol, March 21st, 1828.

SUPERB BULBIOUS ROOTS.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbious Roots, suitable for spring planting. Consisting of double purple, orange, violet, crimson, CAN DAHLIAS. Also, Ferrara Tigrida, or Mexican Tiger Flower—Amaryllis Focississima, or Jacobean Lily—Double Tuberoses, and Ranunculuses; seedlings of which may be seen at this place. The above collection of bulbs is in fine order, and is from the same House from which we obtained the Bulbious roots last autumn, which gave such an uncommon satisfaction.

Landreth's Narcissus—Vear Philadelphica.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green House Plants—Bulbious Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing more in these most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—contains a splendid collection of Green House Plants, most of which are cultivated for the purpose of flowering in the parlour, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and aquatics are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Excellent Vegetables for seeding. The method pursued by the Proprietors in this branch, certainly most obliging for those who are desirous to procure the best seeds, is in the shallow degree. The preparation of those kinds liable to mix in seeding—in short, the whole process of cultivation in gathering, &c. all being under their own personal superintendance undoubtedly conspires in an eminent degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Colman, No. 11 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15.

D. & C. LANDRETH.

Published every Friday, at \$3 per annum, payable at the end of the year—those who pay within thirty days from the time of subscribing, are entitled to a deduction of fifty cents.

AGRICULTURE.

SILK.

Continued from page 305.

It is highly important to feed the worms, in that particular way, which experience has shown to be the most suitable; the leaves, at all times, should be dry when given to them, therefore when rain is likely to fall, it is necessary to gather in a stack before they get wet; if the weather set in, to steady rain, the leaves should be spread in a separate room, and dried before they are given to the worms; leaves wetted by rain, or dew, will either kill them, or bring on some bad disorder; from their birth to the second shedding, they should be fed twice a day, morning and evening, afterwards three times a day to the fourth shedding, and then until they ascend, four, five, or six times a day as they may seem to require it; from the fourth shedding until they ascend, their appetite is voracious, and it should be satisfied by an abundance of leaves of the best quality, those from old trees matured by age, should be reserved for this period, and given to them fresh gathered and dry.

The worms, throughout the period of their existence, should be attended with great care, and regularly; they should be kept perfectly clean, clearing away, often, the remains of the leaves, their own ordure, &c., which otherwise would create a disagreeable effluvia, and breed disorders among them; bad smells are very obnoxious to them, and no smoking of tobacco should be allowed, where they are kept; they should be fed early in the morning, and good leaves should be given them regularly at the times appointed, that no waste of food may take place; the leaves should be fresh gathered, unless in rainy weather, and no leaves offered to them, that have been kept in the house until they have become yellow and sour, which will be the case, in general, after the third day; it is upon these attentions, that a good crop depends; half starved, neglected worms, will give light flimsy cocoons, whilst the diligent, will get them heavy, and rich; worms well attended to, and generously fed, will complete the crop within forty-five or fifty days, those that are neglected, will languish over two months and yield a light result.

The French and Italian establishments, require large premises and a great variety of utensils, such as benches, baskets, boxes of various sizes, and shapes, to suit their extensive concerns; in the progress of time it will become advisable for us to get acquainted, with the minutiae of their arrangements, but at the present day, we shall only point out such preparations as may be requisite, to make a beginning, and which each individual concerned, may afterwards increase, and modify, according to his own views and situation.

Wherever silk worms are to be raised, in any number, it is evident, that a room should be appropriated solely for that purpose; any aspect will answer, except North; the worms require heat, but it must be a free heat, that is with a sufficient circulation of air; a close sultry air, is very bad for them, and so is a damp air; we would much prefer, on that account, a room up stairs, to one on the ground floor; an unfinished room would

answer very well; the doors and windows ought to be closed whenever a sudden transition to cold, or damp takes place, or a thunder storm comes on, which often times will prove an injury to these insects; shelves or boards put up round the room, would be very convenient to keep the worms on, and if requisite a frame in the centre of the room, with shelves one over the other; sheets of large stiff paper, or of paste board, with the edges turned up all round, and stitched at the corners, would answer very well to keep, and feed the worms in, and when they are to be cleaned new leaves might be put in a fresh paper, and laid by the side of that which wants cleaning; the worms would leave it quickly to go to the fresh leaves.

It will be necessary to appropriate a corner for the diseased worms; in the most favored crop, there will be many, and they ought to be taken away immediately, from among the rest, and sent into the hospital to recover, otherwise the contagion may extend, and a great loss ensue.

After the cocoons are made, the first care is to take them down from the brush, clearing away the loose silk by which they are fastened, and selecting the best, those that feel hard and substantial, and of the brightest colour, to keep for seed; the most desirable are the worms, which, at the hatching time, came to life first; they prove to be the most hardy, and will make the best stock; it is necessary to keep an equal number of each sex; the male cocoons are the longest and thinnest, pointed at both ends; the females are larger and rounder, blunt at both ends, and resembling somewhat in shape a hen's egg; these chosen cocoons are to be threaded with a needle, in strings of fifty more or less, taking great care to run the needle slightly through the silk, without hurting the chrysalis which is inside; these strings are to be hung against the wainscot of the room, and in the course of from fifteen to twenty days, the millers will come out males and females; the males always come out first; the females are the whitest and the largest; the males appear most active and shake their wings. It is necessary to procure pieces of woollen cloth, (the Italians always use scarlet,) and to place the millers on them in rows, male and female by the side of each other; after pairing, the male dies; the female soon lays her seed on the cloth; it appears as if glued on; a female yields about 300 seeds; they are first white or yellow, and change to various hues, and finally, if good, become and remain of a dark grey. The Italians preserve the seed on the pieces of scarlet cloth, and at the proper time their women wear them in their bosoms, as observed before, to hatch it. The French are in the habit of scraping the seed off from the cloth, and by wetting slightly the back of the cloth, it will come off easy, and without injury; they put it up then, in small bags, whether it is scraped from, or left on the cloth, it should be packed carefully, and preserved over the winter, in a dry place, where it does not freeze, and where it is not too hot; if it should freeze, the principle of life would be destroyed, and if it should be too warm, the seed would start for hatching, and would be lost; one hundred pair of cocoons will weigh about one pound, and give about one ounce of seed.

Persons who intend to make a business of raising silk, should raise their own seed; it is too important a part of the concern, to entrust to strangers; they should pay the most particular attention to the choice of the cocoons, which they select for seed, and to the preservation of that seed through the winter. The French use stoves to warm occasionally the rooms, where the worms are reared, and thus secure them against any unexpected return of cold weather, and perhaps it may be requisite to use that caution in such parts of New England as are much to the north or west of Boston; in the neighborhood, and further south, we believe that it would not be necessary, and that the only caution requisite, would be the closing of doors and windows, whenever a sudden change in the weather might require it; we have observed before, that hot weather is favorable for the worms, and they can bear it to a high degree, provided it is not sultry and close; on that account, the room where they are kept, should be so situated, and the windows so arranged, that there may be at any time a thorough draft, when wanted, so as to prevent that deadness of air, and unpleasant smell, which would greatly endanger the health, and lives of the worms; in extreme cases of stuffiness, the French are in the habit of burning a small quantity of nitre, in an earthen ware dish, which greatly improves the atmosphere of the premises; it may also answer a good purpose, in such cases, to heat a brick, or a stone, and throw on some vinegar.

Respecting the hatching, from the information we have obtained of those who have attended to that business in our country, nothing is required, when the proper time comes, but to place the seed in a warmer room, but not to the sun, and it will hatch naturally in the course of a short time; it will take several days and longer time than when assisted by human heat; but which is the best, and preferable method of the two, for our climate, time and experience, must determine; the French, and Italians think the finest crop, is generally secured, by hastening the worms through the various stages of their existence, from the hatching to the ascending, and that any check, or delay, is to be esteemed as unfavorable to the ultimate success; hence their vigilance, to secure an even temperature in the apartments an abundance of food for the worms, adapted to their age, in its quality, a perfect and constant cleanliness, and such an arrangement of the windows, doors, and traps in the floors as to insure a free circulation of air, and to prevent that suffocating and offensive atmosphere which would undoubtedly occasion a great mortality among them. The cocoons will not be of a uniform color, they will be of various shades of yellow, and some white, yet they all are of one, and the same species, and may all be worked together; after the cocoons are gathered, and cleared of the floss silk which fastened them to the brush, they should be reeled without delay, and before the millers come out, for if the silk is left on until then, the quality is thereby injured; they should be thrown into a kettle of hot water, a small quantity at a time, and stirred with light clean rods, this will dissolve the tenacious gum by which the threads adhere to-

gether; female industry will search out the end of the thread, and wind and spin the threads from ten to fourteen cocoons together into one single thread, with that care, and correctness, which will make a silk perfectly even, and perfectly clean.

Here we could enter into minute details, and furnish drawings of such winding and reeling machines, as are used in the large Italian and French establishments, but we consider that, at the present early period, it would have a tendency to fatigue, and perplex the attention, of such of our readers as may wish to embark in a trial; their first attempt will probably be upon a limited scale, and undoubtedly the simple means used for winding and reeling in this State, and in Connecticut, which may be more easily learnt by actual view than by tedious descriptions, will be found amply sufficient, and as we progress in the business, our own intelligence and experience, gradually assisted by further information respecting the practice of Europe, will make us fully acquainted with the best process; when it is not convenient, to wind and reel all the cocoons at that time, then all the millers must be destroyed before they come out, in order to save the silk from injury; this may be done in the following manner: a kettle of hot water must be prepared, and when boiling, a sieve filled with cocoons about three or four inches thick, may be placed over the kettle, so as to receive the hot steam without dipping in the water; a wooden cover may be placed over the sieve to confine the steam, and after leaving it in that situation for about ten minutes, you throw the cocoons into a cloth and wrap them up in it, that the heat may be sure to penetrate into them, and destroy the life of the chrysalis: they must immediately, afterwards, be spread in the sun to dry thoroughly, and then be put away on shelves, or on a floor, spread very thin, that the dead insects, within, may dry up and harden. otherwise it might corrupt there, and stain the silk; when this is done the cocoons may be kept, if convenient, for three years without any ill effect to the quality of the silk, which will wind easily, and be as good as if it had been wound immediately, but will not appear quite so bright. At the opening of the season, the object to attend to, is as soon as convenient, to procure good seed of the white Mulberry, and to sow it in rows as before directed, hoeing the young plants carefully and frequently, to keep them free from weeds and as thrifty as possible, that they may gain strength and not suffer from the first winter; the second spring after sowing, they will be in a good condition for gathering, and feeding the worms: nay, any person who should feel desirous of driving the business, may begin to use them the first spring after sowing, and keep on sowing in reserve, not to be used until the third year, when the plants being better rooted, and stronger, can bear without any ill consequences, to be cut down near the ground and would soon be up again for a second crop; it would be desirable to transplant some of the young trees into edge rows, placing them at the distance of two feet apart, and suffering them to grow in the manner of bushes, which would be convenient for gathering the leaves: some also should be transplanted to grow singly with a but; such trees, (as mentioned before,) will give the best and most substantial food; thus the drills of seedlings will give the earliest and tenderest food for the little worms at their birth, the leaves of the edge rows will afford a food next in substance, suitable after the

second shedding, and the leaves of the mature standard trees will, after the fourth shedding, offer to their voraciousness that substantial food which is very requisite, at that time, to satisfy them and to insure a rich and heavy crop; choosing for the whole plantation, a piece of sheltered high ground, sweet and well laid out in the sun, and planting ridges, hedges, and trees in such a manner, as will give to all, the uninterrupted benefit of the light and heat of the sun.

Fully aware of the importance of the object we have presented to the attention of the community, we cannot leave it, without making a concluding appeal to the intelligence and energy of our countrymen, not to suffer any delay to take place in setting their hands, to a work so promising of results the most favorable to our comforts, and for our welfare; the first step is within the farmer's immediate department, to sow the mulberry seed and rear the young trees, and after two years of attendance, the silk raising may commence and will become a healthy and pleasant business for children, and young women. This rich crop will require but two months care to secure it, and when the business shall flourish on a large scale, which we may anticipate, as probable within a short period, the raising of the cocoons will become a distinct occupation for farmers' families; the winding and reeling of the silk also most probably, will be carried on as a distinct and separate branch of industry; this is actually the case in all the silk growing countries, where the cocoons are carried to the public markets and sold for ready cash to those who keep filatures, where they wind and reel them. Great advantages will accrue to the younger members of farmers' families in cultivating so pleasant and profitable an employment at home; it will offer to many young women a choice between home, and the factories, and a resource in case the liberal encouragement given to manufactures, should eventually prove the cause of business being overdone; it will also offer valuable resources for the pauper establishments, where the old and infirm, under a discreet and judicious government, may be made to provide themselves a comfortable support. If we take a retrospective view of the affairs of mankind, since the times of early record, we find that the riches and the prosperity resulting from commerce and navigation, or from a system of extensive manufactures, however brilliant, are comparatively of short and uncertain duration; the changes of views and systems of government at home, the changes of policy among foreign nations, render the whole fabric subject to many sudden and unforeseen vicissitudes, and dependant upon the results of relations abroad, and of the compromise of jarring interests at home, setting at defiance in the course of time, the subtle calculations of the most accomplished statesmen: but the prosperity which is founded upon a perfected agriculture, combining with intelligence the facilities of soil and climate, so as to naturalize, by industry, rich crops of products not indigenous, is a prosperity inherent and lasting. Of the great results of a rich cultivation upon the circumstances and ability of a people, Italy affords a convincing illustration, although groaning under bigotry and priestcraft, without foreign commerce, and without foreign navigation, yet at various periods three or four years of peace with good crops of silk and oil (silk is the richest,) have filled the country again with competence, after the dreadful devastations of war.

There is a certain order in society, the members of which although not united by the bonds of corporate privileges, although unknown to and unacquainted with each other, yet move on with a steady and harmonious step to one common end, the prosperity of their country, the welfare of all its inhabitants; to them, the powerful Bearers of Light, respectfully, we would recommend the consideration of the objects of these lines, and if their judgment joins in accordance with our own, we invite them to endeavour to accelerate its completion, and to save it from a lingering course thro' one or two generations. The knowledge of the rearing of silk, was imparted in the course of about six hundred years by Greece to neighbouring Italy, and in about three hundred and forty years more it was communicated across the line between Italy and France; thus the progress was slow indeed, but such are the miserable results of ignorance and bad policy.

We would repeat that the first step is to prepare an abundance of food for the silk worm, by stocking our warm, light lands, with white mulberry trees; accordingly, wherever there are now white mulberry trees bearing fruit, the fruit should be carefully collected when fully ripe and the seed should be washed out, dried, and preserved; it will be much wanted, and it is both the duty, and the interest of the owners, not to suffer even the smallest part to go to waste. J. M. GOURGAS.

New Zealand Spinach.—This is a half hardy annual, with numerous branches, round, succulent, pale green, thick, and strong, somewhat procumbent, but elevating their terminations. It is a native of New Zealand, and grows by the sides of woods in bushy sandy places, and though not used by the inhabitants, yet being considered by the naturalists as of the same nature of the chenopodium. It was introduced in England by Sir Joseph Banks, in 1772, and treated as a green-house plant. As a summer spinach, it is as valuable as the orache, or perhaps more so. Every gardener knows the plague that attends the frequent sowing of common spinach through the warm season of the year; without that trouble it is impossible to have it good, and with the utmost care it cannot always be obtained exactly when it ought to be, from the rapidity with which the young plants go to seed. The New Zealand spinach, if watered, grows freely, and produces leaves of the greatest succulency in the hottest weather. Anderson, one of its earliest cultivators, had only nine plants, from which he says, "I have been enabled to send in a gathering for the kitchen every other day since the middle of June, so that I consider a bed with about twenty plants quite sufficient to give a daily supply, for a large table."

Use. It is dressed in the same manner as common spinach, and whether boiled plain, or stewed, is considered by some as superior to it; there is a softness and mildness in its taste, added to its flavor, which resembles that of spinach, in which it has an advantage over that herb.—London.

From Wilson's Economy. Just published.

NEW-ZEALAND SPINACH.

This is a vegetable, that appears to possess very valuable qualities. It was introduced here only last spring. It proves extremely productive—so much so, that a few plants of it are sufficient to supply an ordinary family with greens, through the whole summer.

The seed should be planted in hills, three feet apart, in a warm, dry, sheltered situation, two or three seeds in a hill, in good rich soil. The first planting for a summer supply, may be made about the middle of April; and another, for fall use, about the middle of May.

As the fine, rich, succulent leaves of this plant are gathered for use, an abundant succession of buds, shoots, and leaves, are every where produced, all over the plant; and, the more its leaves are used, the more prolific becomes every part of the plant in the increased sources of its verdant supplies. One great superiority, in point of usefulness, that it possesses over the other kinds of spinage, is, that it yields abundantly throughout the warmest months of the summer season.

Extract from the Harrisburgh Penn. Intelligencer.

BUELTA ABAXO.

"The introduction of a new and valuable product of the soil into our country, under any circumstances, should not fail to prove highly advantageous to our agricultural interest. But in the present depressed value of the agricultural staple of our state, the importance of the addition of a new product of the soil, constituting an important article of consumption, the supply of which is exclusively foreign, would be doubly enhanced; & in proportion to the benefits which would result from its successful cultivation, should be the exertions of the agriculturalist to give to it a fair and full experiment. In these days of peace and plenty, the man who makes two blades of grass grow where but one grew before, is not so much entitled to the character of a benefactor, as he who should be so fortunate as to introduce into practicable cultivation some new product of the soil, which would afford ample remuneration, for the labour bestowed on its cultivation. Every day furnishes some new development of the rich resources of our country, and unfolds the capacity of our soil and climate to bring forth every variety of production calculated to minister to the necessities and luxuries of this life. It is not a long time since the cultivation of cotton has been introduced into the United States: within comparatively a few years its circulation has extended until it has become the great staple export from the United States.

In 1798, a member from South Carolina stated in the house of representatives of the United States, 'that the people of the southern states intended to cultivate cotton,' and added, 'if good seed could be procured, he hoped they might succeed.'—*Debates of congress*—vol. 1. p. 79.

Prior to 1802 the cotton wool exported from the United States was blended with that of other countries; no discrimination was made of its origin. On the average of five years, from 1802 to 1807 cotton of American growth annually amounted to 42,147,653 pounds, in 1817, it amounted to 85,648,328 pounds, [Seybert.] At the present period the quantity of cotton produced in the United States, is more than quadrupled, and its cultivation has been gradually extended as far north as Virginia.

The important benefits which have resulted from the cultivation of cotton, the success of which in 1798 was considered problematical may in some degree be realized in our state by the introduction of the cultivation of the fine tobacco, known by the name of the Buelta Abaxo, from

which the best quality of the Havana cigars are manufactured.

Some 'good seed,' has been procured by the enterprize of Jacob Mayland & Co. of the city of Philadelphia, and not without considerable difficulty and expense. They have in this undertaking been influenced by the patriotic motive of affording to the farmers of this country, the opportunity of enriching themselves by the cultivation of a plant which has been the source of immense wealth to the country, in which its growth has hitherto been exclusively confined. Experience has fully tested the complete adaptation of the soil and climate of Pennsylvania, to the production of tobacco of ordinary quality; and as there exists in this state an abundance of the peculiar soil suited to the growth of the Buelta Abaxo there can be no doubt of the success of its cultivation, by using good seed, provided a fair and full experiment is made.

Directions for the culture of the Buelta Abaxo Tobacco.

The soil must be tolerably good, light, sandy or gravelly, the land prepared, the seed sown, and the tobacco planted in the same way as common tobacco, but not too much apart, say in rows of about four feet, and each plant about from 18 to 24 inches. I have seen it at only 12 inches distance, but this must be regulated according to the quality of the soil.

When the tobacco is ripe, which is tested when the deep green begins to acquire a yellowish cast, the stalk is cut in pieces, so as to have two leaves on each piece, riding them on poles placed in the field for the purpose, elevated a few feet horizontally from the ground. On these poles the tobacco is allowed to remain until it wilts, but no longer, as the sun would damage it considerably. It is then removed, on the poles, to the curing house, or barn, and there hung up, leaving room to walk below the lower tier. It here remains until the stem is perfectly dry, after which, on the first rainy day, the atmosphere having sufficiently softened the leaves, so that they can be handled without breaking, they are taken down from the sticks, or poles, and thrown into a bulk, where they lay until the planter is ready for his market. The leaves are then stripped from the stalk, picked and classed according to quality, that is, the wrapper leaves and the filler leaves apart, by themselves, they are then tied by the butt end of the stalks into smaller bundles, called hands, of 25 leaves each, four of which bundles are again tied into larger ones, called carrots, and the carrots very slightly pressed and packed in boxes of about 200 pounds each.

The seed should be sown in February or March, in two beds, one in low dry ground and the other in the woods, in order to have two nurseries, or double chance of success; that in the woods is likely to prove the best; which should be prepared by burning dry brush about two feet deep and scraping the ashes off. The ground then dug shallow and well raked so as the earth shall be completely pulverized. With each table-spoonful of the seed mix a gallon of the ashes, that it may be sown more even over the beds, which will yield plants sufficient for two acres of land; when at the size of an inch, the plants are suitable for transplanting.

Egg Plant.—This is a tender or green-house plant, a native of Africa. The plant rises about

two feet high, with reclining branches; the flowers appear in June and July, of a pale violet color, followed by a very large berry, generally of an oval shape, and white color, much resembling a hen's egg, and in large specimens, that of a swan.

Use. In French and Italian cookery, it is used in stews and soups, and for the general purpose of the leve apple.

The model of a printing press, which was mentioned a few months since, is now in successful experiment in the office of the Christian Advocate and Journal. It is said to be capable of striking off on both sides, from 4 to 5000 sheets in one hour. The sheet is drawn in a straight line between two sets of cylinders, in one set of which the form of types is affixed to the upper cylinder, and in the other to the lower. There are still other cylinders for the purpose of distributing ink to each of the type cylinders. The machine is also contrived in such a manner as to feed itself and lay off the paper, so that only one attendant is necessary. That it will succeed well in stereotype printing, is, we believe, doubted by none.—*Journal of Com.*

Paring and Burning.—However the practice of paring and burning may be admitted under certain circumstances of restraint and limitation, and even recommended as a safe and effectual means of bringing coarse moory land when effectually drained, into a state of profitable cultivation, still its pernicious consequences on the sound dry stabled lands in this country, are such as can never be repaired but by the total abandonment of a system so generally practised in this country, and which is fraught with the means of producing such incalculable mischief. It will readily be admitted that this operation can produce no diminution whatever of the earthy parts of the soil; but as all soil is more or less composed of the earth of vegetables, its exposure to combustion is fatal to it.—*Fancouver's Survey of Devonshire.*

Sea Sand, when used as a top dressing upon grass land, either alone or with mould, never fails to bring forth for a succession of seasons, a very sweet and valuable herbage.—*ibid.*

Foot-rot and Scour in Sheep.—The best remedy for foot rot in sheep is to pare the feet close, wash it clean, and anoint it with the oil of vitriol, or any other strong caustic matter. The wet lay of pastures is supposed to contribute greatly to the production of this complaint.—*ibid.*

Snow.—On Sunday, says a Philadelphia paper, we had an incessant fall of rain, which continued throughout the night; and yesterday morning it was succeeded by hail; about 9 o'clock it commenced snowing, and continued its fleecy blessing through the day. Snow to the depth of eight or ten inches must have fallen, and notwithstanding the unprepared state of the pavement we noticed one or two sleighs in rapid transit during the afternoon.

Much more snow must have fallen yesterday, than during the whole of the past winter.

Planting Fruit Trees.—Let it be observed as a general rule, always to plant or transplant your fruit trees, before a leaf expands or a blossom appears: it is true, that some plant later, but never with equal success.—*JF. Mahon.*

ORCHARDS IN DEVONSHIRE, ENGLAND.

"The usual mode of procuring a variety of fruit, in some parts of this district, is to have a small piece of ground previously prepared, and to spread the pulp or cheese fresh from the press upon it, and with a rake or light harrow mix and well cover it with the surface mould. In the progress of the ensuing growth of the young plants, care is taken to select all such as produce the largest and most luxuriant leaves, as it is from that character that the best expectations are formed for procuring the most valuable fruit. The rejected plants are drawn out from time to time, and the preserved ones left, to discover their specific qualities.— These, when approved of, and which point is generally ascertained by the end of the 6th year from the time of sowing the pips, their heads being previously formed upon a stem about five feet high, are removed to any eastern, but that of north-east aspect; and on the side of a hill, free from springs, though rather a moist subsoil, are planted generally at the distance of 25 or 30 feet apart, holes being previously made, and depositing in each about two seams or horse loads of road scrapings, or way soil.

"In planting the orchards, care should be taken to place all the trees of the same sort or quality in rows, by which means the fruit ripening together can more easily be kept separate, milled, expressed, and the juice fermented together; objects of the first consequence with all good ciderists, as the mixing of the fruit is found to produce unequal and repeated stages of fermentation, and thus exhausting the strength and proving highly injurious to the cider. In other places the pulp or cheese from the press is immediately washed, and the clean kernels sown in the month of March following; after standing two years in the seed beds the plants producing the largest leaves are removed to a nursery, and set out four feet apart, at five years old from the seed a part of these stocks are grafted, and others left to discover their natural produce, which not answering, are afterwards grafted also. Great pains are bestowed in training the young tops which is done by cutting off the shoot chin high, and afterwards pruning the top branches for three or four years, within six or eight inches of the stem. This strengthens the trunk and roots, and gives considerable security to the tree when removed to the orchard. After remaining three or four years in the nursery from the time of being grafted, they are usually transplanted into a south-eastern declivity, at the distance of 30 feet apart, and will keep in good bearing for a period of forty years. By such means very fine fruit is often produced."—*Fanconer's Survey of Devonshire.*

[From Memoirs of the New York Board of Agriculture.]

ON THE MANUFACTURE OF BUTTER AND CHEESE.

BY S. DE WITT, ESQ. OF ALBANY.

SIR,—You are engaged, I understand, in preparing, or superintending, a publication of the transactions of the Board of Agriculture. Permit me to suggest to you a few thoughts that may be useful on this occasion. Multifarious as must be the objects of your Board, on which information is expected and intended to be given, I will take the liberty to mention one or two which I think have not received the attention they merit; I mean the management of milk in the making of butter and cheese.

Whatever may be said about the difference of cattle, pastures, or climate; to apologise for the inferiority of our productions of such articles, compared with those of Europe, we do know, and have in numerous instances proved, that we can here make them of as good a quality, and if it can be done in one, it can be done in every instance. We have the same materials, and by the same management the result will be the same every where. When I first came to Albany, more than thirty years ago, I found a Mr. Hudson, an Englishman, settled as a farmer near Cherry Valley, celebrated for his excellent cheese; afterwards a Mr. Tunnichill, also an Englishman, on the Susquehanna, equally celebrated in the same way. I have had cheese from both, which would not suffer in a comparison with the best from England of the same age. Since that, we only now and then hear of persons who have deservedly acquired the character of good cheese makers. Why is this so? Why is it so rare to find a farmer who makes such cheese as is entitled to praise? Why is it, that while tons of this article are brought to our market, it is so extremely difficult to find any which a man of taste would tolerate on his table? These are matters which I conceive have not received that attention which they merit from our public institutions designed for the melioration of our agricultural interests.

Butter is also an article in the making of which our country is miserably deficient. Good butter is so essential in cookery, and on the table, that no good meal can be prepared without it, and yet scarcely any of the best quality is attainable in our markets. I may here make a similar remark to what I have made in respect to the making of cheese. We have the same materials which those have who make this article in the highest perfection. That we have it not of equal perfection is entirely owing to the ignorance or a wilful neglect of the means by which it may be so made. From the rarity of meeting with butter that can with propriety be called good, we are accustomed to call that so which is barely free from rancidity. And that delicious flavor, which is the essence of good butter, is forgotten or considered as a quality not to be expected in what comes to our market. This was not the case in this place thirty years ago. A different manner was then pursued, which has been since generally abandoned, but which is still continued in the counties of Ulster and Orange. I may here again ask, why is this so? The reason is in part to be found in the obstinacy of inveterate habits in our new population, and partly in the neglect of efforts from our institutions for meliorating the agricultural condition of our country, in regard to this important branch of it.

Impressed with the importance of this subject, I made a communication on it, in 1819, to Mr. Southwick, then editor of the Plough Boy, which he published in that work, giving the practice of making butter in the counties of Ulster and Orange, from which that article has been most celebrated in the market of New York. In 1820, I met with an essay in the New York Evening Post, taken from a Boston paper, which I considered as the best dissertation, within my knowledge, on the method of making butter. I recommended its insertion in the Plough Boy, which with my prefatory note, was accordingly published.

As these publications, containing highly interesting information in regard to the matter under

consideration, must necessarily have been limited in the extent of their circulation, I am inclined to think that it would be of use to have the substance of them, if not the whole, incorporated with the transactions of the Board of Agriculture now preparing for the press.

On the subject of manufacturing butter I cannot refrain from saying something more. It will be simply concerning the operation of churning. Last summer visited a farmer near Ithaca, who kept a dairy, supplied by about sixteen cows, and conducted in the manner I have been accustomed to see in Ulster and Orange, as described in my communication for the Plough Boy; the butter from which commanded a higher price than any other in that part of the country. The working of the churn was done by a dog. The machinery for this purpose was simple. It consisted of a circular platform inclined to the plane of the horizon, and moving on an axle through its centre. The dog was placed on it near its edge, with a rope fastened round his neck and attached to an adjoining fixture. In this situation, the platform being put in motion, the dog was obliged to perform the operation of walking on it upwards; by which means the motion was continued, and by means of a simple contrivance communicating with the churn-stick, the churning in this manner was performed and completed in about a hour: when the dog was dismissed and received his customary reward, a plentiful repast on milk. Thus treated, he returned to his labor with alacrity when it was again required. The churn held of milk and cream, put together into it, about or nearly the contents of a barrel. I staid during the process of one churning, and was highly gratified with it, and what contributed much to my gratification was the delicious beverage of butter milk, with which the mistress of the dairy treated me.

As having not a very remote relation to dairies, some remarks on pastures and meadows, will not be out of place here. With regard to these, we have in this country availed ourselves but little of the precepts founded on a thousand years' experience beyond the Atlantic, where their value is duly appreciated, and the fruits of them are fully enjoyed. There we are taught, that in order to have good pastures or meadows, no pains or expense must be spared to enrich the soil where that is needed, to destroy as far as possible by a suitable course of husbandry—every weed an plant that previously occupied the field—to have the ground perfectly pulverized by ploughing and harrowing, and then to sow on it a plentiful quantity of grass seeds suited to the soil, and of those kinds which have been proved to be the best for those purposes. The fault I mean to find with our practice contrasted with that of the English, is this—for pasture or meadow we sow in the spring of the year, on a field of winter grain, a small quantity of grass seed, from which we expect our future pastures and meadows, and trust to their branching out in two or three years so as to make tolerable pastures or meadows. In the mean while other grasses and weeds spring up so as to occupy most of the ground; and this is most notoriously the case in our new country, where the seeds of thousands of varieties of plants lie in the ground ready to spring up and overcome the growth of artificial grasses. In order to prevent this, the English practice before described is the more necessary here. The aboriginal weeds must be first destroyed by preceding

crops especially by those which require the use of the hoe, and then such a quantity of clean, well selected grass seeds must be sown as will cleverly fill the ground, and in their growth smother every other vegetable. For this purpose too much seed cannot be put in the ground at once. The practice of putting a small quantity of grass seed on ground laid down for pastures or meadows, is one of the greatest errors in the husbandry of our country. On this subject I wish that our farmers would consult a book published in London, called the *Complete Grazier*. It gives receipts for the kinds and quantities of seed per acre proper to be sown on all the varieties, of soils, such as clay, loam, sand, chalk, peats, up-lands, mid-lands, and lowlands. As a sample, I will copy the receipt for an acre for low lands:

Meadow Foxtail,	2 pecks.
Meadow Fescue,	2 do.
Rough stalked poa.	2 do.
Rye Grass,	1 do.
Vernal Grass,	1 quart.
White Clover,	2 do.
Marl Grass,	2 do.
Rib Grass,	2 do.

In the receipts for the various soils the quantity of seed is generally about a bushel per acre. Let this be compared with our practice.

(To be continued.)

Potatoes.—It is a usual practice in Ireland to prepare the potato sets [cuttings of potatoes] from some of the fairest and best potatoes, during the broken weather in the preceding winter. In the dry situations they are then placed, they become encrusted with the juice of the potatoes, and are justly supposed to bleed less before germination than if fresh cut in the spring of the year. The set of course is stronger, and it puts forth a more vigorous shoot soon after being planted. The planting of small potatoes, or sets having more than two strong eyes, is with reason objected to; the number of eyes, on what is called the crown of the potato are always rejected, with the small potatoes, both being found to produce languid shoots and a number of small head potatoes of no value.—*Vancouver's Survey of Devonshire.*

Farm Horses.—If we except the treatment of the farm-horses in Ireland, those in Devonshire have, perhaps as hard a measure of neglect and ill-usage dealt out to them, as is any where to be met with in the united kingdom. From the injudicious manner in which they receive the corn occasionally given them, it is a point of some question, whether it affords them a benefit, or by diverting their appetite from the hay, pea or other straw, absolutely produces an injury from the avidity with which they swallow the corn unmaniculated. To remedy this evil a better example nowhere presents, than what may be drawn from the management of farm and wagon horses in Pennsylvania and Maryland. These horses perform journeys of two or three hundred miles over the steep and mountainous of that country, with prodigious loads of wheat and flour from the interior, and wet and dry goods from the seaports to the different points of embarkation, at Fort Pitt, Red Stone, Charleston and Wheeling, and other places on the Ohio river. Notwithstanding which these wagon-horses, through the whole extent of that country are seldom seen in a less high condition than the brewers' and other large cart-hor-

ses in the metropolis of this country. [London].—The manner in which the American horses are sustained to perform these labours, is generally by feeding them with hay and straw chopped about half an inch long, with which is mixed about half a peck of rye, oats or indian corn meal, to about two and a half or three pecks of hay or straw thus chopped. A feeding trough sufficiently large for four or five horses to eat out of at the same time is attached to each wagon. The chaff is put into this trough, and after being well mixed with the given quantity of meal, is moistened, and again well stirred together till every shred of the hay or chopped straw is found to be covered, or as it were frosted over by the meal. The avidity with which the horses eat their meal thus prepared, may be well conceived. Their meal finished, they either pursue their journey or lie down to rest, but in either case not without being well dried and cleansed from the effects of their last labour. It is the pride of the carters, as well as the wagon masters in that country to see their horses in a condition rather above than under the labour they have to perform; and in a hundred miles travelling from Baltimore or Philadelphia, the surveyor will be bound to say that as many prime wagon horses, and in as high condition, shall be seen, as in any direction for that distance from the city of London. The adoption of a similar treatment in the management of the farm and wagon horses in this country, needs no farther recommendation than the solemn asseveration as to the truthtis here stated.

"The baiting of post, stage, and travelling horses with rye, oat, or bean bread, in the manner performed on the continent, is an infinitely more economical and facile mode of administering refreshment to a jaded animal, than by giving them the crude unbroken corn, so universally practised in this country."—*Ibid.*

Turnips.—It may not be amiss in this place to offer a few observations on the relative excellence of the Scotch two furrow turnip husbandry, with that of the common broad cast. Observation and experience clearly show, that the depredations of the insect called the fly, on the young turnip plants, are precisely in proportion to the feebleness and want of growing vigour in the infant plants; and that as soon as they are pushed into the rough leaf, all farther danger from the insect is at an end. The rough leaf, however, will be frequently seen perforated, and as the foliage enlarges, the holes enlarge with it, giving the appearance of having been much damaged by the fly, and by which it certainly would have been destroyed, had not its growing vigour sustained it against the attack. From the early and ample supply of nourishment afforded the young plants by the layer of dung occupying the tops of the two-furrow ridges, their roots strike immediately upon or near it, receive the invigorating principle, and a quicker and stronger growth ensues, greatly abating the risk of their destruction by the fly, and with a much smaller allowance of dung per acre than must necessarily be applied to afford any thing like a prospect of success by the broad cast method. The distance between the rows from top to top of the ridges, according to the prospect of luxuriance in the crop, may be varied from 18 to 26 inches. The facility of horse-hoeing and setting out the plants by hand in the rows, the bottoms being raised out of the reach of the win-

ter's mud and water, render them less liable to be injured by the frost, and upon the whole, the produce per acre, where the ridge husbandry is properly conducted, is so very much increased, as is in time to warrant a fair expectation of its superseding the broad-cast turnip husbandry in all cases whatever.—*Ibid.*

Ridge planting, though proper in the humid climate of Great Britain, would not be so suitable for that of the United States. The row or drill culture, however, on a plain surface is preferable for turnips; and answers the purposes of saving nature, increasing the crop, and rendering the culture more easy than in the broad-cast method.—*Ed. of the N. E. Farmer.*

The Potato.—The history of the potato conveys to us a most instructive lesson, forcibly reminding us of the extraordinary lengths to which prejudice will carry mankind, and showing us by what apparently trivial circumstances this prejudice is often removed, when the most powerful and influential arguments have failed to weaken it. The introduction of this valuable root to the gardens and tables of the people, received, for more than two centuries, an unexamined opposition from vulgar prejudices, which all the philosophy of the age was unable to dissipate, until Louis XV. of France wore a bunch of the flowers of the potato in the midst of his court on a day of festivity; the people then, for the first time, obsequiously acknowledged its usefulness, and its cultivation, as an article of food, soon became universal. Now, its stalk considered as a textile plant, produces, in Austria, a cottony flax. In Sweden, sugar is extracted from its roots. By combustion its different parts yield a considerable quantity of potash. Its apples, when ripe, ferment and yield vinegar by exposure, or spirit by distillation. Its tubercles made into pulp, are a substitute for soap in bleaching. Cooked by steam, the potato is one of the most wholesome and nutritious, and, at the same time, the most economical of all vegetable aliments. By different manipulations it furnishes two kinds of flour, a gruel, and a parenchyma, which, in times of scarcity, may be made into bread, or applied to increase the bulk of bread from grain; and its starch is little, if at all, inferior to the Indian arrow-root. Such are the numerous resources which this invaluable plant is calculated to furnish.

Upwards of 1700 garments have been forwarded to the Greek committee of this city by the ladies of New London.—*N. Y. Farmer.*

Pike, or Pickrel Oil.—The oil of a pickrel is of a subtil, mollient nature, and is found in many cases to be of the greatest efficacy, especially in the ear-ache, or sores in the head. Two or three drops of the oil dropped in the ear, has never failed of giving immediate relief, in every case of the ear-ache, though of the most odidurate kinds. It has been applied in cases of burns and scalds, as well as swellings and inflammations in the feet; it has the most happy effects. It has likewise been known to work a cure on an old wound, where almost every other means had been tried without effect. To extract the oil, take the fatty parts of the entrails of the fish, (such as the carl, &c.) put them into a clean vessel, and simmer them on a gentle fire, until the oil becomes fine and clear—then it may be strained through a fine cloth, and put into a vial, close stopped, for use.

French Sugar Beet.—It is from the roots of this beet that the French and Germans obtained sugar with so much success during the late war. The following was the ordinary process: Reduce the roots to a pulp, by pressing them between two rough cylinders—put the pulp in bags and press out the liquor it contains—boil this liquor, precipitate the saccharine matter by quick lime—pour off the liquor—add to the residuum a solution of sulphuric acid, and boil again. The lime uniting with the acid, is got rid of by straining. The liquor may then be gently evaporated, or left to granulate slowly, after which it is ready for undergoing the common process of refining raw sugars.—*London.*

GARDENING.

We wish to call the attention of our readers to the delights and advantages of a good garden.—This subject is not sufficiently attended to. There is perhaps nothing in the world, which more properly combines the *utile cum dulci* (the useful with the sweet) than a well cultivated garden. Who does not admire the neatly formed beds, well rolled and levelled over, with clean alleys between? Who does not feel a glow of pleasure and pride, as he beholds the young shoots bursting from the seeds planted by his own hands, and rising timidly above the surface of the ground; as he watches their growth, and finally sees them arrive to maturity? Who does not delight to see his vegetables standing in orderly ranks—not like a vile array of militia, straggling hither and thither, nor like rows of regular soldiers prepared for death's doings—but growing up to give pleasure, sustenance and health to their peaceful cultivator! Who does not contemplate with unmingled delight his garden esculents of every kind, from the climbing peas to the creeping melons, from the asparagus in beds to the celery in trenches—in short, every species of vegetable which is to furnish the table, and afford profit, comfort and satisfaction to the cultivator? If there be such a being on earth, set him down for a fellow of no taste, no economy, no ingenuity, no philosophy, no gentleness and no domestic virtues.

On the score of profit merely, a garden is not to be overlooked; for if well managed there is no other spot of ground of the same dimensions, which yields so bountiful a return. There are many persons who live no other soil than a few square rods attached to their houses, and it is therefore a matter of prudence so to cultivate it as to derive from it the greatest possible advantage. Yet important as it is, there are few persons in this country who obtain from a garden half the profit it is capable of producing. They seldom have early vegetables of any kind, because they neglect to plant them in season. The cultivation of the garden is postponed to every thing else, and peas, lettuce, &c. are scarcely committed to the ground, when they ought to be fit for the table.

But though the raising of esculent plants demands the first attention, we would not have the horticulturist grudge a small share of his garden to the cultivation of flowers. It is true they are not articles of profit, inasmuch as they neither furnish our tables nor fill our purses; but they were not considered beneath the care of the Creator of all things, and the most splendid monarch of Israel "in all his glory was not arrayed like one of" them. For ourselves, nothing affords more pleasing sensations, more indescribable delight,

than to behold the first flowers of spring opening their buds and displaying their beauties to the enraptured eye. The hyacinth, the daffodils, the violets, the trailing arbutus—whenever blossoms first in our gardens or fields, we welcome as the heralds of Flora, and (if we may so speak) as the first fruits of the vegetable resurrection. If ground be wanting to cultivate flowers more extensively, at least the borders of the principal aisles in our gardens may be adorned, and beauty and pleasure go hand in hand with comfort and utility.

[*Berkshire American.*]

Useful hint.—The following discovery has been lately communicated by the Royal Society of Sweden to that of London: "After roofing a house with wood, boil some tar and mix it with finely pulverized charcoal till it is of the thickness of mortar—spread this with a trowel about a fourth of an inch thick over the roof—it will soon grow hard, and defy all the vicissitudes of weather.—Roofs thus covered, have stood in Sweden above a century, and still want no repair."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 25, 1828.

JERUSALEM ARTICHOKE—*Helianthus tuberosus.*

The Jerusalem artichoke is a hardy perennial, a native of Brazil, and is of the same genus as the sun-flower. It is propagated and cultivated like the potato. We have been informed that this root will grow and produce a profitable crop on poor land, and *without manure*; though with deep ploughing and good manuring its culture would probably be attended with greater profit. It was much esteemed before potatoes were known. The epithet, Jerusalem, is a corruption of the Italian word *Girasole*, (from *girare* to turn and *sol*) or sun-flower; the name Artichoke is bestowed from the resemblance in flavor, which the roots have to the bottoms of artichokes. It is superior to the potato, in being more hardy, and not liable to be injured by frost; but we believe it contains somewhat less nutritive matter. Its tops are large, and may make a valuable addition to the farm yard, of a substance which may be converted into manure. From the circumstances of its flourishing in a poor soil, and producing large leaves and stalks, there can be no doubt that it derives much food for plants from the atmosphere, which by its decay is imparted to the soil on which it grows, or on which after rotting it is spread as manure. There is no plant, which more completely shades the ground, and it must in that way enrich it. It will flourish in the shade of trees and buildings, where other plants will not thrive. We believe there are thousands of acres of land in the more populous parts of the United States, which are now considered as not worth cultivation, which would produce considerable quantities of the Jerusalem artichoke, with no other trouble than *once* planting, and digging the roots from time to time as they are wanted.

Dr. Darwin says that the Jerusalem artichoke will not ripen its seed in Great Britain, (and we do not believe it will in New England) by being suffered to grow in the open air, under ordinary cultivation. But by forcing the plant in pots or hot-houses, perhaps seed might be obtained. This would, probably, be desirable, for it is supposed that all plants degenerate if propagated merely

by slips, root, cuttings, &c. without having recourse to seeds. Potatoes should be renewed from the seed, at least once in twelve or fourteen years, or they will degenerate, and probably Jerusalem artichokes might become more valuable by the same means. Planting large and fair roots, with suitable soil and culture will retard this degeneracy, but we believe not wholly prevent it.

Use. The roots are esteemed a wholesome, nutritious food, and are eaten boiled, mashed with butter, or baked in pies, and have an excellent flavor. Planted in rows from east to west, the upright herb of the plant affords a salutary shade to such culinary vegetables as require it in the mid-summer months, as lettuce, turnips, and strawberries.

The second volume of Memoirs of the N. York Board of Agriculture contains remarks on this root by Levi McKean, of Dutchess, in which he gives it as his opinion that artichokes are best suited for cultivation in this climate as a crop for hogs, sheep, and dairies, of any article that we have yet tried; and besides the use of this crop for stock, which many writers consider to be equal to potatoes, they are also recommended highly as an article of human diet. It is true, that when boiled, they do not possess that peculiar farinaceous quality, that is so much esteemed in the best sorts of potatoes; but it is said that when roasted, they are a very delicate article for the table, their taste then resembling the ground nut of this country. The only objection we have heard stated to this vegetable as an article of field culture, is, that when once suffered to enter it, will take exclusive possession of a soil; and thus when a change of crops is desired, becomes a most troublesome weed. But by turning in a sufficient number of hogs, the artichoke may be entirely eradicated; and probably a poor soil which would answer no other purpose of culture might be planted with the Jerusalem artichoke and converted into a permanent pasture for swine. If not over-stocked with the animals, the plants would keep possession of the soil which they would meliorate; and when it should be wished to change the crop, turn in hogs enough to root out the artichokes.

ORNAMENTAL FLOWERS.

Extracts from Dr. GREEN'S Treatise on the cultivation of Ornamental Flowers. Just published at this office.

Horticulture, as it respects Ornamental Gardening, is one of the most innocent, the most healthy, and to some, the most pleasing employment in life. The rural scenes, which it affords, are instructive lessons, tending to moral and social virtue; teaching us to 'look through nature up to nature's God.'

Flower gardens were ever held in high estimation by persons of taste. Emperors and kings have been delighted with the expansion of flowers. "Consider the lilies of the field," said an exalted personage, "how they grow;" for Solomon, when clothed in the purple of royalty, "was not arrayed like one of these." Nature, in her gay attire, unfolds to view a great variety, which is pleasing to the human mind; and consequently has a tendency to tranquillize the agitated passions, and exhilarate the man—nerve the imagination, and render all around him delightful.

The cultivation of flowers, is an employment adapted to every grade, the high and the low, the rich and the poor; but especially to those, who

have retired from the busy scenes of active life. Man was never made to rust out in idleness. A degree of exercise is as necessary for the preservation of health, both of body and mind, as food. And what exercise is more fit for him, who is in the decline of life, than that of superintending a well ordered garden? What more enlivens the sinking mind? What more invigorates the feeble frame? What is more conducive to a long life?

Floreiculture is peculiarly calculated for the amusement of youth. It may teach them many important lessons. Let a piece of ground be appropriated to their use—to improve in such a manner, as their inclinations shall dictate—to cultivate such plants as are pleasing to their taste; and let them receive the proceeds. Let order and neatness pervade their little plantations. Let them be instructed, that nothing valuable is to be obtained or preserved without labour, care, and attention—that as every valuable plant must be defended, and every noxious weed removed; so every moral virtue must be protected, and every corrupt passion and propensity subdued.

The cultivation of flowers, is an appropriate amusement for young ladies. It teaches neatness, cultivates a correct taste, and furnishes the mind with many pleasing ideas. The delicate form and features, the mildness and sympathy of disposition, render them fit subjects to raise those transcendent beauties of nature, which declare the "perfections of the Creator's power." The splendid lustre and variegated hues (which bid defiance to the pencil,) of the rose, the lily, the tulip, and a thousand others, harmonize with the fair fostering hand that tends them—with the heart susceptible to the noblest impressions—and with spotless innocence.

Egg Plant.—This is the only vegetable, in all our list, that cannot be raised to perfection, without the aid of a hot-bed; and whoever will have it, of their own raising, must be at that expense.

It ought to be made early in March, and kept constantly at a good growing heat till May, when the plants may be fully exposed to the open air, and about the middle of the month, set out in rows, three feet apart, and two feet distant in the rows.—*Wilson's Economy.*

TO CORRESPONDENTS. Several communications are on hand, and will soon be published; one from Salem, on Cattle—one on Teazels—one on Bees, and one on Geological Surveys, will appear next week.

New Agricultural Works.

Just published, and for sale at the office of the New England Farmer, is a Treatise on the Cultivation of Ornamental Flowers; comprising Remarks on the requisite Soil, Sowing, Transplanting and general Management; with Directions for the general treatment of Bulbous Flower Roots, Green-house Plants, &c. By Roland Green. Price 37 cts.

Likewise, just received from New York, is Economy of the Kitchen Garden, the Orchard, and Vineyard; with plain practical Directions for management. By William Wilson, Nurseryman. Price 75 cts.

Also, Observations on the Efficacy of White Mustard Seed, (*Sinapis alba*) taken whole. From the 10th London edition, revised and improved. Price 6 cts.

Also, Seventy-five Receipts for Pastry, Cakes, and Sweetmeats. By a Lady of Philadelphia. Price 50 cts.

For Sale or to Let

The three elegant Stud Horses "Dey of Algiers"—"Ranger," and "Young Highlander;" all sired by the celebrated Horse Highlander. Two full-blooded English Bulls—two Bulls and several Heifers, three and seven-eighths blood Hollanderess, or Short Horned breed.

Also, two Farms in Tolland, and a convenient House in the central part of the City of Hartford. Inquire at the office of the New England Farmer, or Ralph Watson, East Windsor, Connecticut. April 13.

Bulbous Roots, &c.
Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbous Roots, suitable for spring planting. Consisting of Black, purple, orange, violet, crimson, rose, maikien, bronze, and white colored DOUBLE MEXICAN DAILIAS. Also, Perraria Tigrida, or Mexican Tiger Flower—Amaryllis Formosissima, or Jacobean Lily—Double Tuberosa, and Kamotees; paintings of which may be seen at this place. The above collection of Bulbs is in fine order, and is from the same House from which we obtained the Bulbous Roots last autumn, which gave such uncommon satisfaction.

One Box of assorted Scions, of the best sorts of Apples, Pears, Plums, Peaches, and Quinces—carefully packed in clay, for transportation. Price \$4.

1000 Asparagus Roots, two years old, in fine order. Lakewit, Early English Mauly—English Kidney, and Chango seedling Potatoes. One barrel Early Royal George Potatoes, an early sort and prodigious bearer—price \$2 per bushel. This is a valuable kind for market gardeners.

6000 two year old seedling Hawthorn Quicks, for fine fences in fine order, at a moderate price.

10 barrels Early Frame Peas, raised in Bangor, Me.

A further supply of the celebrated New Zealand Spinach, (*Tetragona expansa*).

1000 pounds fresh Lucerne, imported from Europe this spring. Also, a consignment from Albany, of 50 barrels Marrowfat Peas, by the barrel, at a very low price.

Seeds of the Cuba Tobacco, (*Baccha thara*) Yellow Tobacco, Teazel, Spring Wheat, Spring Rye, Barley, Rape, Broccin Corn, Spring Vetches, Castor Oil Bean, Corn, (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Barbet, Orchard Grass, Rye Grass, Tall Meadow Oats Grass, White and Red Clover, Mangel Wurtzel, &c.

Also, Seeds for Ornamental Flower Seeds, &c. comprising the largest collection of Seeds to be found in New England.

Landreth's Nurseries.—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to their Nurseries, as offering peculiar facilities for the acquisitions of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without any fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning to the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the department of green-house Plants, they grow almost every variety of Esulent Vegetables for seeding. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seeding—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance undoubtedly ensures in an eminent degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15. W. D. & C. LANDRETH.

New Vegetables.

Just received at the New England Farmer Seed Establishment, a small invoice of rare and choice vegetable seeds, from Europe, comprising Large Green Artichoke of Laon, (considered the finest sort known, but very rare, even in Europe)—King of the Mountains New Silver Giant Celeriac—Asparagus of Alenquage, a new and superior sort—for sale in packages of 12-12 cts. each.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 25 cts. per pound—Shot—Balls—Flints and Percussion Caps. Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Du Pont Powder Store*, No. 65 Canal street—By E. COPELAND, Jr.

The Du Pont sold as above, is warranted first quality—and is marked "E. Copland, Jr. Boston," on the head of the cask. u March 11

Peach Trees.

Just received from the Hartford Limbago Botanic Garden, 20 bunches assorted Peach Trees, which are offered for sale at the Agricultural Warehouse, 52 North Market street—where specimens of the Fruit may be seen. April 25

Horticultural Botanic Garden.

ANDREW PARMENTIER, Proprietor of the Horticultural Botanic Garden, (Brook Hill, Long Island) two miles from New York, offers for sale a very large assortment of the most approved Pear, Apple, Plum, Peach, Cherry, Apricot, Nectarines, Gooseberries, &c.; some of them are very handsome Trees—some Pear Trees on Quince stock, for dwarf, and some Apple Trees on Paradise stock. Forest Trees of large size, very fine for planting in streets, such as Horse-chestnut, European Lime or Linden Tree, Birch, Larch, Ash, Elm, White Beech, &c. Weeping Willow, Paper Mulberry, Catalpa, Japan Aspidula, Laburnum, Balsam Poplar, &c. A very large collection of hardy Rose Trees, mostly Roses, Herbaceous plants, Shrub, &c. and a fine collection of Green-house Plants. Also, Strawberries of fine kinds, including the monthly everbearing without runners. Very fine Hasel-nuts, three years old, at 25 the thousand. Mr. P. in delivering Trees, will give directions for planting them. Subscribers for one dozen kinds of cherry and Grapes, containing the White, the Fontaineau, the Yellow Thorney, the Golden, the Musk, and Royal Chappelle—the White, Violet, Black, and Grey Muscat—the large Marce, and the large Frankenthal, for 50 the dozen, with directions for planting, cultivating, &c. Fine vines well packed in moss and oats, in such a manner as to go several hundred miles farther than N. York. Mr. P. will furnish in a certain quantity, Grape Vines at 25 cents each root, for veyarders, wanted to go Provisional catalogues can be had gratis, at Mr Charles Swan's grocery and tea store, No. 357 Broadway, or at Messrs Thorburn & Sons, 67 Broadway, New York, where orders can be left or directed by the Post Office, to their Establishment, Brooklyn. Mr. P. delivers the Trees or Plants in the city, free of expense for cartage, transported in his cart, and carefully taken out and delivered on the place where they must immediately be placed. Orders can also be left with the following Agents: J. R. Newell's Agricultural Warehouse, No. 52 North Market street, Boston—Mr. E. W. Bull's Seed Store, Hartford, Con.—Mr. Lewis F. Allen, Danbury—Mr. Luther Tupper & Co. Rochester—Mr. William E. Norman, Hudson—and Mr. A. B. Allen, Mobile. April 25

MISCELLANIES.

[The following hymn was composed by Dr. Hawkesworth, (a short time before his death) and repeated to his wife before he rose in the morning.—]

In sleep's serene oblivion laid,
I safely pass'd the silent night;
O'er more I see the breaking shade,
And drink again the morning light

New-born, I bless the waking hour—
Once more, with awe, rejoice to be;
My conscious soul resumes her power,
And springs, my gracious God, to thee

Oh! guide me thro' the various maze
My doubtful feet are doom'd to tread,
And spread thy shield's protecting blaze
Where dangers press around my head

A deeper shade will soon impend,
A deeper sleep my eyes oppress;
Yet still thy strength shall me defend,
Thy goodness all shall deign to bless

That deeper shade shall fade away,
That deeper sleep shall leave my eyes;
Thy light shall give eternal day,
Thy love the rapture of the skies.

Epitaph in a country church-yard.

Here I
Do lie.

But when the trumpet last will sound,
Thou shalt I use above the ground.

There is a portion of mankind who are always either naturally or habitually behind hand. This trait of their character is easily discovered in every thing that relates to their conduct and pursuits in life. Such a man goes too late to bed—and as a necessary consequence gets up too late in the morning. Being out of bed too late, he is too late at breakfast, and this deranges the affairs of his household all the forenoon. Having been behind hand at breakfast, he of course is behind hand at dinner, and lastly at supper. If he makes an appointment, he never gets to the place in season; and if he is to meet a board of directors, or a committee, or any public body whatever, he is always twenty minutes or half an hour too late, and upon being reminded that he has obliged his associates to wait, and thereby to waste their time, he charges his delay to his watch; which, like the owner, is always invariably at least a quarter of an hour too slow. If he has made arrangements to leave town in a stage, especially if it is an early stage, he commonly forces the carriage to wait for some time, or, what is not very uncommon, is left behind. If he intends to take his departure in a steam boat, you will meet him two streets off as the last bell tolls, and after running down to the wharf finds the boat hauled off; and if he gets aboard at all it is by the long boat, and often at the hazard of his life. If he is an attendant upon public worship, he never reaches the church until after the services have commenced, and greatly disturbs the congregation by entering in the midst of their devotional exercises. In short, such men labor, and toil, and drudge on through life, just as uniform and regular in their concerns, *half an hour too late*, as punctual people are in season. If such persons could, by some great exertion, redeem that half hour, and set their watches right, they might go on with the same ease they do now, and always be in season.

Botanical Curiosity.—In the last number of Edwards' Botanical Register, there is a figure of the fine new "Air Plant of China," long known to the Europeans by the drawings of the Chinese, and celebrated for the splendor of its flowers and the fragrance of its perfume. It has for some years been cultivated in the stoves of this country—but no means could be discovered for making it grow, till a new method was pursued by the gardener of his Royal Highness the Prince Leopold, at Claremont, which finally proved successful. Under this mode of treatment a branch of blossoms was produced, between two and three feet long—and composed of some hundreds of large flowers, resplendent with scarlet and yellow. The plant has the remarkable property of living wholly upon air, and is suspended by the Chinese from the ceilings of their rooms, which are thus adorned by its beauty and perfumed by its fragrance.—*London Medical Gazette.*

Rail Way.—A wager, for a small amount, as to the power of draught of a horse on the Monkland and Kirkintilloch railway, was decided in presence of several of the members of the committee of management of the railway, and a great crowd of spectators. The horse in question started from Gargil Colliery, drawing a weight of fifty tons, on fourteen wagons, which it conveyed to Kirkintilloch, a distance of seven miles, in the short space of one hour and forty-one minutes. The first two miles of the above distance was on a level, and the remainder was on a descent, varying from one in 120 to 1,100 with several level tracts.—*Glasgow Chronicle.*

The Chimpanza.—This enormous monkey inhabits the coast of the Gulf of Guinea. Its height is sometimes greater than that of a man; it has a snarl beard and mustachios, and is exceedingly pugnacious. It lives in society—at least numerous individuals of the species congregate together to plunder the negroes, and carry off their wives. It builds itself a hut, makes love to their negroesses, and drive away those who approach his dwelling, by pelting them with stones. Several young ones have been tamed, and found to possess great imitative talents.—*Lon. Review.*

Potato Bread.—At the Edinburgh Agricultural meeting, at which above three hundred noblemen and gentlemen attended, Sir John Sinclair addressed the party after breakfast, and informed them that a great part of the bread they had been eating, was composed chiefly of potato flour; and that if the country would be contented with such bread, Britain would never require a bushel of foreign grain.

Caterpillars.—This is one of the worst enemies to an orchard when neglected, but easily destroyed with a little attention, in the spring when the nests are small, and the insects young and tender. They never venture abroad in the early part of the day, when the dew is on the trees, or in bad weather; they may then be effectually destroyed by crushing them in the nest. This attention continued for a short time every spring, will destroy those in existence, and will prevent their increase in future years. If left till grown strong, they wander from their nests, and cannot be effectually overcome without great trouble and expense.—*Coxe on Fruit Trees.*

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of seeds to be found in New England—of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

<i>Artichoke,</i> Green Globe	<i>Alon,</i> Blue Apple
<i>Asparagus,</i> Devonshire	Green Curran
Gravesend	Persian
Batterssea	Nutmeg
Large white Reading	Large Antelope
<i>Beans,</i> (36 varieties,) including	Pomgranate, or Musk
the English broad beans,	Carolina Water
dwarfs and pole	Long Island Water
<i>Best,</i> true Long Black	Apple seeded, Water
Early blood Turnip	<i>Marjoram,</i>
Early White Scarcity	<i>Musard,</i> White and Brown
French Sugar, or Amber	<i>Mustard</i>
Orange	<i>Mung (Warts),</i>
Green, (for soups, &c.)	<i>Okra</i>
<i>Pea-cod</i>	<i>Onion,</i> Potatoe
<i>Brocoli,</i> Early White	Tree
Early Purple	White Portugal
Large Cape	Yellow
<i>Brussels Sprouts,</i>	Madras
Early Salisbury dwarf	Strasbourg
Early York	Large Red
Early Dutch	<i>Parsley,</i> Siberian
Early Sugarloaf	Dwarf Curled
Early Lon. Battersea	Curled, or Double
Early Emperor	<i>Parsnip,</i> Large Dutch swelling
Early Wellington	<i>Peas,</i> Early Washington
Large Bergea, &c.	Early double blossomed
Large Cape Savoy	Early Fame
Large Scotch	Early Golden Hotspur
Large Green glazed	Early Charlton
Large blue Drumhead	Early Strawberry Dwarf
Tree, or 1000 headed	Black blue topseeded
Green Globe Savoy	Dwarf blue Prussian
Red Dutch	Dwarf Spanish, or Fan
Yellow Savoy	Dwarf Marrowfat
Turnip rooted, &c.	Dwarf Sugar
Russian	Matchless, or Tall Mat.
Late Imperial	Knight's Fall Marrow
Late Sugarloaf	Tall Curled pod Sugar
<i>Car-Loon</i>	<i>Pappers,</i> Long, or Cayenne
<i>Correts,</i> Altringham	Tomato, or Squash
Early Horn	Cheer
Blood Red (or West India market)	Early
Lemon	<i>Peonkims,</i> Finest Family
Long Orange	Corncockle Field
Cremor	Mammoth
<i>Cauliflower,</i> Early and Late	<i>Raidish,</i> Early Frame
<i>Celery,</i> White solid	Short top Scarlet
Rose coloured solid	Long Salmon
Italian	Purple Short Top
Celeriac, or turnip rooted	Long white, or Naples
<i>Cherid,</i>	Cherry
<i>Corn Salad,</i> or Yettick	Violet colored
Cress, Curled or Peppercress	White Turnip Rooted
Broad leaved or Garden	Black Flat, or Spanish
Water	<i>Rhubarb,</i> for tarts, &c.
Long Orange	<i>Ruta Bogva,</i>
<i>Cucumber,</i> Early Frame	Silvery, or vegetable oyster
Green Cluster	<i>Sua Kale,</i>
Short Prickly	<i>Skiret</i>
Long Prickly	<i>Soregenera</i>
Long green Turkey	<i>Suffon</i>
White Turkey	<i>Spinach,</i> New Zealand
White Spined	Blackly, or Fall
Small Girkim, &c.	Round leafed summer
<i>Egg Plant,</i> Purple	Egg. Patience Dock
White	<i>Stee,</i>
<i>Endive,</i> Green	<i>Squash,</i> Early bush Summer
White Curled	Long Crook Neck
broad leaved Batavian	Vegetable Marrow
<i>Garden Pursel</i>	Porter's Valparaiso
<i>Garlic Sets,</i>	Avron
<i>Indian Corn,</i> (several varieties)	<i>Tomatoes</i>
<i>Kale,</i> Sea	<i>Turnips,</i> Early White Dutch
Purple curled	Early Garden Stone
Green curly Scotch	White Flat, or Globe
<i>Leek,</i> London	Green Round
Large Scotch	Red Round
<i>Lettuce,</i> Early Curled Sicilia	Swan's Egg
Large Garden Head	Large Egg, Norfolk
Royal Cape	Long Tankard
Imperial	Long Yellow French
Hardy Green	Yellow Dutch
Brown Dutch	Yellow Maltese
Grand Admiral	Yellow Aberdeen
Tomnball, or Rose	Yellow Stone
Drumhead	Yellow Swedish
Magnum Bonum Coss	Pedham
Bath Coss	<i>Thyme—Sweet Basil—Borecole,</i>
Ice Coss	<i>Lavender—Rosemary—Hyssop,</i>
White Coss, or Tatf,	<i>Wormwood—Sage—Sarrif—</i>
Green Coss	<i>Pony root—Spikenard—Dill,</i>
	<i>Rain—Tansy—Borage, &c.</i>

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VI.

BOSTON, FRIDAY, MAY 2, 1828.

No. 41.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

Salem, 21st April, 1828.

MR. FESSENDEN.—I send you the pedigree of the improved Durham short horned stock, presented, at a very great expense, to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Collins, for the purpose of improving the breed of cattle in his native State: also of two of their descendants raised by myself. You have the certificate furnished by Mr. Wetherell, at the time the animals were imported. Also, a very detailed account of them and their ancestors, as extracted by me from Coate's Herd Book, a work devoted exclusively to this celebrated stock. I have been thus particular as I think it may be important to have on record, some account of these valuable animals. You will perceive they are all very nearly related to the celebrated *Comet*, who was sold in London for one thousand guineas, and are traced back to *Hubbuck*, who is reported to be the foundation of the stock. I have reason to think them a great acquisition to our country. *Annabella*, *Emma*, and *Young Comet*, are at my farm in Salem. *Admiral* is with the Hon. John Welles, at Dorchester.

Yours, &c.

E. BERSY DERBY.

ADMIRAL.

Pedigree of bull *Admiral* from Mr. John Wetherell, Kirkby Malbury, 28th May, 1823. Is two years old, a beautiful roan, got by my *North Star*, dam by *Comet*—grandam by *Wellington*—g. grandam by *Danby*. *North Star* was by *Comet*, dam by *Baronet*—grandm by *Cripple*—g. grandam by *Irishman*—g. g. grandam by *Hubbuck*.

North Star, roan, calved in 1815, twin calf with *Northern Light*, bred by and the property of B. Wetherell, got by *Comet*—dam, *Lady*, bred by Mr. Spours, by Mr. Mason's *Baronet*—grandam by *Cripple*—g. grandam by *Irishman*—g. g. grandam by *Hubbuck*.

Comet, red and white roan, calved in 1804, bred by Mr. Colling, got by *Favorite*—dam, *Young Phoenix*, by *Favorite*—grandam, *Phoenix*, by *Foljame*—g. grandam, *Favorite*, bred by Mr. Manard, by Mr. R. Alcock's bull—g. g. grandam by Mr. Jacob Smith's bull—g. g. grandam by Mr. Jolly's bull. *Comet* sold for one thousand guineas, and died in 1815.

Wellington, bred by Mr. Wetherell—got by *St. John*, dam by *Trunnell*—grandam by *Danby*.

Danby, bred by Mr. Wetherell—got by Mr. J. Brown's *Paddock* bull—dam by Mr. J. Brown's *White Bull*.

Baronet, roan, calved in 1806, bred by Mr. Mason, got by *Chilton*—dam, *Lydia*, by *Favorite*—grandam, *Nell*, by Mr. Mason's *White Bull*—g. grandam. *Fortune*, bred by Mr. C. Colling, by *Bolingbroke*—g. g. grandam by *Foljame*—g. g. grandam by *Hubbuck*—g. g. g. grandam, bred by Mr. Maynard.

Cripple, red and white, calved in 1800, bred by Mr. Mason, got by *Irishman*—dam, *Fortune*, bred by Mr. C. Colling, by *Bolingbroke*—grandam by *Foljame*—g. grandam by *Hubbuck*—g. g. grandam, bred by Mr. Maynard.

Irishman, red and white, calved in 1798, bred by Mr. Mason, got by *Styford*—dam, *Fortune*, bred by Mr. C. Colling, by *Bolingbroke*—grandam by *Foljame*—g. grandam by *Hubbuck*—g. g. grandam, bred by Mr. Maynard.

Hubbuck, yellow, red and white, calved in 1777, bred by Mr. John Hunter, of Horwosh—dam bred by Mr. John Hunter, by a bull of Mr. Banks, of Burworth—grandam, bought of Mr. Stephenson, of Ketton. *Hbbuck* was got by Mr. George Snowdon's bull—dam from the stock of Sir James Pennyman, and those from the stock of Sir William St. Quintin, of Scampston—Snowdon's bull, by Wm. Robson's bull, bred by Mr. Wastell, of Great Burdon, near Darlington—dam, Mr. Wastell's *Roan Cow*. *Burforth*, William Robson's bull, by James Masterman's bull, bred by Mr. Walker near Leyburn, James Masterman's bull by the *Studdy Bull*, bred by Mr. Sharter, of Chilton.

The following account of the pedigree of the dam of *Hubbuck*, was given to Mr. Coates, the author of the Herd Book, by Mr. John Hunter:

Hurnworth, near Darlington, July 6th, 1822. I remember the cow which my father bred, that was the dam of *Hubbuck*; there was no idea then that she had any mixed or *Kyloe* blood in her. Much has been lately said, that she was descended from a *Kyloe*; but I have no reason to believe, nor do I believe, that she had any mixture of *Kyloe* blood in her."

ANNABELLA.

The pedigree of the heifer *Annabella*, from Mr. John Wetherell, Kirkby Malory, 26 May, 1824.—Red and white, calved in 1820. Was got by *Major*, dam *Ada*, by *Denton*, grandam *Aurora*, by *Comet*—g. grandam by *Henry*—g. g. grandam by *Danby*—and in calf by *Rockingham*.

Major, red and white, calved in 1815—bred by Mr. R. Colling—got by *Wellington*—dam by *Phenomenon*—grandam by *Favorite*—g. grandam by *Favorite*.

Ada, roan, calved in 1813—bred by and the property of Mr. J. Wetherell—got by *Denton*—dam *Aurora*, by *Comet*—grandam by Mr. Mason's *Henry*—g. grandam by *Danby*.

Denton, bred by Mr. Wetherell—got by *Comet*, dam *Young Red Rose*, by *St. John*—grandam by *Trunnell*—g. grandam by *Danby*.

Aurora, roan, calved in 1813—bred by and the property of Mr. J. Wetherell—got by *Comet*, dam by Mr. Mason's *Henry*—grandam by *Danby*.

Comet; see *Admiral's* pedigree.

Henry, roan, calved in 1806—bred by Mr. Mason, got by *St. John*—dam, *Danby*, by *Favorite*—grandam, *Lily*, by *Favorite*—g. grandam, *Miss Lax*—bred by Mr. Manard, by *Dalton Duke*—g. g. grandam, *Lady Manard*, by Mr. R. Alcock's Bull.

Danby; see *Admiral's* pedigree.

Rockingham, formerly called *Wellington*, bred by Mr. T. Jobling, and property of Mr. Wetherell—got by *Minor*, dam by *Phenomenon*—grandam by *Colonel*—g. grandam by a son of *Hubbuck*.

EMMA.

The pedigree of the heifer *Emma*, raised by E. H. Derby—dark red and white, beautifully mixed, calved 28th January, 1825. Was got by *Rockingham*, dam *Annabella*, by *Major*—grandam, *Ada*, by *Denton*—g. grandam, *Aurora*, by *Comet*—g. g. grandam by *Henry*—g. g. g. grandam by *Danby*. *Rockingham*, formerly called *Wellington*, bred by T. Jobling, and property of Mr. Wetherell, was

got by *Minor*, dam by *Phenomenon*—grandam by *Colonel*—g. grandam by a son of *Hubbuck*.

For the pedigree of all the above, excepting *Minor*, *Phenomenon*, and *Colonel*, see the pedigree of *Admiral* and *Annabella*.

Minor, dark red, bred by Mr. R. Colling—got by *Favorite*—dam, *Red Rose*, by *Favorite*—grandam by *Pencil*—g. grandam by *Foljame*—g. g. grandam by *Hubbuck*.

Phenomenon, bred by R. Colling—got by *Favorite*, dam by *Ben*—grandam by *Hubbuck*—g. grandam by Snowdon's Bull—g. g. grandam by Sir James Pennyman's Bull.

Colonel, bred by Colonel Simson—got by Mr. C. Colling's lame bull.

YOUNG COMET.

The pedigree of the bull *Young Comet*, raised by E. H. Derby—dark red, with a few white spots, calved 5th March, 1826. Was got by *Admiral*, dam *Annabella*, by *Major*—grandam, *Ada*, by *Denton*—g. grandam *Aurora*, by *Comet*—g. g. grandam by *Henry*—g. g. g. grandam by *Danby*. *Admiral*, bred by Mr. Wetherell, was got by *North Star*, dam by *Comet*—grandam by *Wellington*—g. grandam by *Danby*. *North Star* was by *Comet*, dam by *Baronet*—grandam by *Cripple*—g. grandam by *Irishman*—g. g. grandam by *Hubbuck*.

FOR THE NEW ENGLAND FARMER.

BEES.

An effectual remedy to protect bees from the bee-moth. About the first of May, or perhaps earlier, when the bees begin their spring work they may be saved from the ravages of that destructive insect the bee-moth, through the season, by a very easy and simple way, viz: scrape a spot on the ground smooth, near the bee-house, or wherever it may be convenient, then place the hive on the bare ground and put some kind of covering over it to keep it dry, and when new swarms come off let them be taken care of in the same manner.—Either set them beside of the old hive or in some other convenient place on the bare ground. Bees that are managed in this way will produce as many swarms in a season as they did formerly in a bee-house before the moth was heard of.

The reason why a hive of bees is secure on the ground. The millers which are the breeders, when first entering a hive, seem rather timid, not venturing at first above the base. They generally deposit their eggs at first around the inward edges of the hive, and if there are any crevices between the hive and the board or floor that it stands upon, they are sure to secrete some of their eggs there, and it will be but a short time before the cots or in other words the covering that encloses the eggs may be seen from which the grubs soon escape. The grubs will soon creep up into the hive and begin their depredations upon the honey and young bees. The grubs, or worms, seem to prefer the young bees that are in the cells to feed upon at first, instead of the honey. A hive of bees that is attacked by the moth, is not always destroyed the first year, but is very sure to be the second. The millers never deposit any of their eggs in a hive set on the ground, because they do not find any convenient place under the hive. The

method as above stated, may not always save old swarms of bees, already infested by those mischievous insects, (although I have not lost any myself secured in this way,) but it is sure to save new swarms. Perhaps some gentlemen may object to this mode of managing bees, on account of ants and some other insects that may creep into the hive; but there is nothing to fear from them. The large black ants do sometimes destroy honey in hollow trees, where the bees are situated high from the ground. I have seen in some instances considerable injury done by large black ants, in hollow trees in the woods, containing swarms of bees. Also the bee-moths are found in hollow trees. I recollect one instance in particular, of ants eating out honey in a tree. It appeared that the swarm of bees had occupied the hollow tree for several years. The hollow was about 30 feet from the base of the tree, and eight or ten feet in length, and at the upper part of the cavity there were a great number of large ants, and they had consumed a considerable quantity of honey.

Various methods have been suggested for the protection of bees from the moth; a trial has been made by placing small blocks of wood at each corner of the hive, so as to raise it about two inches high, which leaves open such vacancies at the sides of the hive that the bees are much disturbed by the wind and dust that enters the hive, and in some instances the dust has injured the honey, and without having the desired effect of saving the bees from the moth; also sprinkling fine salt under the hive does not answer any good purpose. I have frequently known the honey to melt down in a hive when in a warm place in a bee house, but there is little or no danger of that kind while the hive is on the ground, and the bees and honey are kept cool. I have tried this method as above stated and described, seven or eight years, and it has been attended with complete success. Some years ago I lost a considerable number of swarms by the moth, but I have not lost any since I adopted this plan of setting them on the ground; excepting one swarm that I let remain in my bee house by way of experiment, that one was destroyed by the bee-moths the first season. Some other people have secured their bees in the same way, as they would be ready now to testify. Late in the fall of the year, those hives of bees that are to be kept over winter must be taken from the ground and put into a bee house, or in some other place for safe keeping. If those persons who keep bees will only be so good as to try the experiment when their bees swarm the present season, or try it with some of their old swarms I have no doubt but that all will be entirely convinced of the truth and correctness of the above statement.

DAVID CHANDLER.

CULTIVATION OF THE TEAZEL.

MR. FESSENDEN.—In answer to a request of *E. W. B. Vol. 6. No. 38.* relative to the cultivation of the Teazel, or Fuller's Thistle (*Dipsacus*.) I can inform him that for ten years past, I have cultivated the teazel upon a deep black sandy loam, manured as often as once in two years from my horse stable. They require a deep loose soil, as they root very deep like carrots. The ground should be well prepared about the first of May, and the seed sowed immediately in drills about two

feet apart, and to the depth of 3-4ths of an inch, and about the same thickness as carrots. They will show themselves in about two weeks, when they are to be carefully weeded, and tended thro' the season. In July, or August, thin them out so much that they will not stand nearer than four inches apart, when those that remain will wilt, and lop down, but will soon rise up. Just previous to the ground's freezing in the fall, they should be covered (on the rows only) with horse dung, just enough to turn off the water, for in covering too deep, mice will be very sure to work among them. Early in the following spring, take off the manure carefully, and convey it to some other part of the field, for in laying it between the rows it will make the ground very dry, and injure the growth of the plants. After taking off the manure, take a spade, and take out the plants in such manner, as to leave a plant standing once in 2½ feet, remembering not to injure the standing plants with the spade, and also to fill up the vacancy with light earth.

In transplanting those plants taken out, recollect to put them the same distance from each other as those not transplanted, by means of a common iron bar. By giving them good attention, and hoeing frequently they will be ready to cut about the middle of August. They should be cut about four inches below the burr, after they begin to turn yellow, and then dried upon a temporary scaffold two feet high, in the sun about three days, remembering to carry them in under cover nights. In cutting, the person will need a pair of leather mittens, and when drying must use a rake in spreading them on the scaffold. I communicate the above as my manner of procedure, and I can say I have generally had good success, especially in 1822, I raised, and sold from six rods square of ground, teazels for which I received at my garden \$31.---Yours, &c. J. N. HINSDELL.

Bennington, Vt. April 24, 1828.

FOR THE NEW ENGLAND FARMER.

GEOLOGICAL SURVEYS.

England has been greatly enriched by her mines. Her coal not only furnishes power to her numerous manufactories, and fuel for her more common and domestic purposes, but is extensively used almost in the midst of the forests of America. Her ores furnish employment to thousands of her citizens, and, when their value is thus increased many thousand per cent, they find a ready and extensive market in the midst of our own mines and water power and ingenuity.

Their mines have been discovered not by the magic of the divining rod, but by the natural connections and associations which are found to exist among the productions of the mineral kingdom. From these associations the presence of one mineral indicates, with a degree of certainty, that another is near. In other cases the appearance of a certain mineral gives information which may be depended upon, that a certain other would be searched for in vain. They inform us not only where to search, but where not to search. They not only promise a fortune to the explorer, but caution him against the loss of one.

That we possess, in our mineral treasures, vast sources of industry and of wealth, not yet discovered, is as certain as that fortunes have been spent in fruitless searches after them. And it may fairly be hoped that the modern science of Geology, which is extending with unexampled rapidity,

while it presents a most interesting subject for the improvement and enlargement of the mind, will also develop and apply the resources of our country, so as to increase the business, the wealth, and the prosperity of the nation.

In whatever section of the country geology has been introduced, it has seldom failed to lead to the discovery of articles, which have been applied to advance the interests of the artist in his business, as well as to enrich the cabinet of the amateur of the science.

In one instance, a geological excursion led to the discovery that the farmers of a section in New England, had built walls for their common enclosures for a hundred and fifty years with specimens of the finest marble upon the earth. Another excursion discovered the chromate of iron, which was soon used for the manufacture of chrome yellow, and in a short time reduced the price of that beautiful pigment, from sixteen dollars to fifty cents a pound. From the same source copperas is now made in such abundance and at so cheap a rate, as wholly to prevent the importation of that article. Several other useful articles, purely the fruits of geology and mineralogy, aided by chemical science, now fill our markets from our own resources.

So well aware are the English that their wealth and prosperity are connected with their mineral treasures, that every county in the kingdom has been subject to minute and careful surveys, in their geology as well as their agriculture. In a few instances their example has been followed in this country, and in no one without a rich reward for the trouble. And from the success which has uniformly attended the partial surveys already made by the liberality and enterprise of individuals, it is hoped that our legislatures will soon deem it a subject worthy of their patronage. It is to be regretted that on this subject Massachusetts is behind most of her sister states. The legislatures of several of the states have already effected surveys for the purpose of maps. From these surveys maps and gazetteers are already furnished. And among the New England states, Massachusetts and Maine are the only ones in which these two important articles, accurately executed, are not to be had. In two or three states measures are now taking to effect surveys both of their geography and geology, in a more minute and careful manner than attended those formerly made. This is as it should be. For whether we consider the geography and geology of our country as branches of popular education, in their relations to internal improvements, or in their application to the business of the manufacturer and farmer, they are equally worthy of the patronage, not only of individuals but of legislatures. AGRICOLA.

FOR THE NEW ENGLAND FARMER.

MR. FESSENDEN.—It is I believe not generally understood in this city and in its vicinity, that Admiral Sir Isaac Coffin is about to afford fresh proof of his regard for his place of nativity, by sending to Boston, for the benefit of the breed, two thorough bred horses, Barefoot and Serab. I need only mention these valuable animals, to have them known in the sporting world, as they are frequently named in the sporting magazines. But for the information of those who have not the opportunity of seeing these works, I must beg you through the medium of your respectable paper to give the

following description of the horses. They are very beautiful, and their pedigree is as follows:—*Barfoot* was got by Tramp; dam Rosamond, by Brozzard, out of Roseberry, sister of Holey and Tartar, by Phenomenon, out of Miss West by Waltham, Regulus, Crab, Childers, Basto. *Scrab* by Phantom; dam by Totteridge, out of Crash, by Highflyer, out of Nutcracker, by Melthem. These horses have beaten at several very celebrated races in England. At York, Doncaster, Ascot Heath, and on other courses, and it is believed that they are equal if not superior to any animals of the kind ever brought to the United States. In addition to the above horses, Sir Isaac Coffin has been at great trouble and expense to procure a perfect Cleveland Bay, and they were expected to embark on the 20th of this month in the packet ship Amethyst; and it is but justice to state that the Boston and Liverpool Packet Company have very liberally allowed them a passage free.

Boston, April 29

FRANKLIN.

SPRING WORK.

BY THE EDITOR.

Insects.—Be careful in season to destroy caterpillars in orchards, &c. While yet in small clusters they are easily conquered, but if they get the upper hand, and are suffered to send forth their foraging parties over the cultivator's premises they are almost as difficult to subdue as the habit of hard drinking. "A stitch in time saves nine," and the destruction of a few insects in season prevents the existence of countless hordes of their progeny.

"Watering with common water" says M'Mahon, "proves very beneficial to trees infested with insects; especially, if thrown against them with some force, by means of a small water engine.—This will not only displace caterpillars and many other insects, but greatly refresh the trees, especially in dry weather; and if often repeated where insects appear, it will considerably diminish their number and prevent their spreading.

"The most eligible engines, are such as have the pump and discharging pipe fixed in the vessel for containing the water; of which some are of a moderate size for carrying about by the hand, but larger ones are fitted upon a low, light, three wheeled carriage for the more convenient removing from place to place. This engine may be conveniently used for watering different parts of the garden in dry weather.

"The newly planted trees will be greatly benefited by occasional waterings, which should always be given in the morning and frequently over the branches, as well as about the roots; this will be of great service in washing off any dust and filth which their leaves may have contracted, and in opening their pores for the reception of the atmospheric moisture."

It is necessary to be all attention to your young rising crops of peas, beans, cabbages, onions, carrots, parsnips, &c. &c. and free them from weeds as soon as they appear above ground. Apply a small hoe where practicable, and in other cases make use of your fingers.

Sow hardy aromatic herbs, if not done before. Small salads three or four times for successive crops. Radishes, peas and beans three or four times with intervals of six or eight days. Carrots for winter's use may yet be sown.

Indian corn is frequently required in a garden. Select some of the earliest sorts of corn, and a

piece of dry, sandy, and tolerably rich ground in a warm exposure to plant it in. Prepare the ground up for peas. Then form drills about two inches deep at the distance of five or six feet from each other. Drop the seed therein two and a half feet asunder, and two grains in a place; after strewing a little plaster or wood ashes in the drills, cover the seed as you would peas.

Florida.—The editor of the Pensacola Gazette, states, that 50,000 bales of cotton will, this year, be brought to the bay of Appalachicola, from the country bordering on the Chattahoochee, Flint, and Appalachicola rivers. All this cotton, he adds, with the trade it gives rise to, might, at a trifling expense, be brought to Pensacola, a place equally delightful, from climate and situation. A canal, or rail way, is already in agitation to connect the Chipola river with the eastern arm of St. Andrew's bay. The Appalachicola is connected with the Chipola by Hort's lake, at the lower end of which is a narrow strip of land separating them from St. Andrew's bay. When the canal, or rail way, through this strip of land is completed, only four more miles of canal are requisite to connect the Chipola river with Choctawhatchie, between which and the bay of Pensacola a communication is already open, through the Sound of St. Rosa. There are peculiar facilities existing along this coast for the formation of a line of inner coastwise navigation.

North Carolina.—The gold mines excite increased attention—but for all that we have yet heard, more value would be made in digging for potatos than for gold, and the same quantity of labor applied to manufactures would produce much more of that precious metal. Diggings for gold are hardly ever profitable—in common phrase, "it costs more than it comes to."—*Niles' Reg.*

Indigo.—A New-York paper states, that the cultivation of indigo is to be resumed in South Carolina. It is further stated, that it can be raised any where in the United States, South of N. Carolina.—*Salem Observer.*

From the Boston Literary Gazette.

A treatise on the cultivation of ornamental flowers, &c. By Roland Green. Boston, John B. Russell. 1828.

We are pleased with any thing which may attract the attention of our citizens, especially the female part of them, to the delightful science of floriculture. For the humble in life it affords a cheap and pleasant recreation, and for the rich, what bestowal of their abundant leisure can ensure a greater portion of real epicurean enjoyment than the cultivation of beautiful plants? It is alike a pleasure to youth and to age. The happiest old man we ever met with was the superintendent of the Liverpool Conservatories. He had lived for a long life among flowers and verdant plants, and in his age was as flourishing as the greenest of his charge. With a beautiful enthusiasm, the old man bent fondly over the opening bud, or walked proudly among the shapely and blooming people of his little paradise, as a prince amid his children and vassals, and certainly no conqueror ever bore his trophies with more triumph, than he did the jewel presented to him by Alexander of Russia in token of his bloodless conquests over the vegetable kingdom; nor

is this learned and venerable gentleman, under whose care the garden of Liverpool has obtained superiority over all the others in England, alone in the love of floriculture. The most eminent philosophers and poets have not disdained the humble lessons and simple delights of the flower garden; and we do believe that the progress of pure taste and true refinement is in no way more distinctly marked than by the cherishing of nature's beauties. For ourself, and we know we are not singular in that respect, whenever we pass a dwelling the windows and verandas of which are glowing with flower vases, we "desire it more acquaintance" and set it down as the abode of "good people." We do not believe that disorder or evil passions can prevail in a household where a love for the quiet pleasures of floriculture is evinced—and have no doubt that the presence of these "fair and innocent things of nature's loveliness" has deep and salutary effect on the human character.

After this [rhapsodical some may think] flourish of our goose-quill, rather perhaps for our own gratification, we can only refer our readers, who like flowers as well as we do, to the remarks and directions of Dr. Green, with the assurance that they will be found entertaining and useful.

C. arcoal.—On the 13th ult. a female in Augusta, came near losing her life by being in a small room in which was placed a small cooking furnace, with burning charcoal, there being no fireplace in the room to carry off the suffocating exhalations of the coal. She was found upon the floor nearly lifeless.

Measles in Swine.—About once a week, mix two spoonful of madder in their food, which prevents obstructions, acting as a diuretic, and at the same time an astringent. And, on some other day in the week, give a spoonful or two of an equal quantity of flour of sulphur, and salt petre, well pounded and mixed.

Illuminated Clock.—The committee for rebuilding the steeple of the State House in Philadelphia, intend that the new clock to be placed there shall have an illuminated dial, similar to that recently placed in St. Mary's Church, Islington, and in several other churches, near London. The time can be distinctly told three quarters of a mile distant from St. Mary's church on the darkest night, if free from fog.

A letter from General La Fayette, dated Jan. 13, to his friend Morgan Neville, Esq. of Ohio, mentions the intention of M. Perier, and his wife (a grand daughter of the General) a grandson, and the two boys of G. W. La Fayette, to visit the United States.

Meat may be preserved fresh many months, by keeping it immersed in molasses. A joint of meat, or any provision, suspended in a flannel bag will keep sweet much longer than by most of the modes commonly practised. The cooler and dryer the meat is, when the flannel is put round it the better, and the flannel should be perfectly clean.

Fatal Carelessness.—In Union county, Ohio, a few days since, a young lady was shot dead by a lad who presented a musket to frighten her, not knowing it was loaded.

[From Memoirs of the New York Board of Agriculture.]

ON THE MANUFACTURE OF BUTTER AND CHEESE.

BY S. DE WITT, ESQ. OF ALBANY.

(Continued from page 317.)

Here it is proper to be observed, that in laying down grounds for pasture lands, the English select the seeds of such grasses as will come to maturity in succession; but I think they carry this scheme to excess, and that there is no necessity for a mixture of such a variety of seeds to be used for these purposes. In our country the most esteemed grasses are—white and red clover, timothy or herds grass, the red top and Foul meadow.—With these some other indigenous grasses intermix, the merits of which deserve to be investigated. Our best grasses for meadows are unquestionably the timothy, the red top, and FOUL MEADOW. The merits of this last mentioned grass are not generally known, and I suspect it to be the best, for low alluvial soils, to be found in our country. It appears to me to be a variety of the red top, *Agrostis vulgaris*, and preferable to it, being more delicate in its structure, and having leaves more slender, longer, and in greater abundance. I have been told by an acquaintance from Orange county, that it is chiefly used on the reclaimed drowned lands there, and preferred to all other grasses, and that it yields most abundant crops. I know from my own observation for a number of years, that without any artificial preparation it has gradually supplanted the coarse aquatic grasses on the lower parts of the low-lands at Ithaca. There can be no better hay than that which is made of it.—On a rich, moist soil it will grow uncommonly dense, and I should think would yield as much from an acre as any other of the best cultivated grasses.

In order to make a good meadow on a rich soil, I would recommend this practice. Destroy all the weeds and natural grasses by ploughing, harrowing, and suitable crops. Prepare the ground by sufficiently pulverizing it, and then sow on it so much timothy seed as that the growth from it shall immediately cover the ground, at least as thick as a field of flax. This then will give you clear, abundant crops of timothy to the exclusion of every other grass. Or if the ground be inclined to moisture, use foul meadow seed in the same manner; or make use of a mixture of timothy and foul meadow; at all events be not sparing of seed, and immediate abundant crops will be the reward. Timothy and foul meadow or red-top, I consider as the best of any known grasses for our low-land meadows, and the more every other kind can be kept out of them the better. Some of the English grasses may be advantageously used in laying down permanent pasture grounds; but white clover and timothy are the best in use among us. Lucerne is to be preferred for soiling and enriching the ground, when fallowing is intended. By means of it, with the assistance of gypsum, the poorest soils can be made valuable.

I have said that too much seed cannot be put in the ground at once. Every body knows what a small quantity is generally used, and how long it is before lands laid down as pastures or meadows come to perfection, and how they are injured by grasses of spontaneous growth, which ought not to be there; but for which the greater part of the surface of the ground is left by the stingy sower. In confirmation of the propriety of these remarks,

I will make further quotations from the *Complete Grazier*.

"The following proportions were sown a few years since by the Earl of Darlington:

White or Dutch clover,	17 pounds.
Clean hay seed,	14 bushels.
Rib grass,	} 1½ pounds.
Trifolium,	

By which means (the soil being previously ploughed very fine, and made perfectly level) the land was speedily covered with a thick and excellent herbage. The only exceptionable thing in this practice is the quantity of seed, which is certainly too large for a statute acre."

The last remark, I presume, means an unnecessary waste of seed, not that the quantity used was an injury to the production of the field.

"Mr. Daltoe's mode of laying down land to grass is, to make the ground perfectly smooth and level, and then sow upon every acre the following seeds, viz:

Hay seeds,	6 bushels.
Rib grass,	12 pounds.
White or Dutch clover,	8 do.
Burnet,	5 do.

He manures it with a compost of earth, dung and ashes, thoroughly mixed together, and folds his sheep upon it, &c. The proportion of seed, however, is still too great, though in other respects his management be excellent."

"In the laying down of land for the purpose of forming a good meadow, greatly superior to the generality of pastures, the late Mr. Curtis recommends the following grasses, and two species of clover to be mixed in the following proportions:

Meadow fescue grass,	one pint.
Meadow fox tail grass,	do.
Rough-tailed meadow grass,	half a pint.
Smooth-stalked do.	do.
Crested dog's-tail,	fourth of a pint.
Sweet-scented spring grass,	do.
White or Dutch clover,	half a pint.
Common or red clover,	do.

"These are to be mixed together, and about three bushels of them sown on an acre."

Such appears to be the practice where agriculture has been growing towards perfection, aided by all the efforts of man, and the acquisitions of science and experience assiduously and constantly applied for its melioration for more than a thousand years. Now let the practice in our country be considered. With the reflection of this light on it, how most wretched does it appear!

How far the grasses of Europe are proper for our country, experience must decide. We know that one of our best grasses, timothy or herds grass, cannot be cultivated to advantage in England, and sufficient experiments have not been made, or if made, not recorded, to ascertain which of the English grasses would be an acquisition in our practice of husbandry. Nor have the proper researches yet been made to ascertain what additions may be made to our pastures and meadows, by the introduction of the grasses on which our cattle subsist in their ranges in our forests. For this purpose I would advise, that a boanist should turn a horse or cow, not starved, but with an appetite rather sated, into the woods, at a proper season of the year, and observe the grasses which the animal would select for its food. By this means some might be discovered which would make valuable additions to those used with us for our pastures or meadows.

I have met with a remark in some English treatise on the subject under consideration, that "a good pasture is too valuable ever to be broken up." If this be the case, let the man who undertakes to prepare a dairy farm, soliloquize in this manner, when he is preparing his pasture fields.—I am now about doing what is to be done only once in my life-time, on the farm from which I am to obtain my living; therefore let no pains or expense be spared to have it done in the best possible manner. I will plough, harrow, and hoe my field, and raise such crops on it as are best calculated to destroy every kind of vegetable now growing on it. I will make use of every means that can be contrived to enrich the ground. I will pulverize the soil, and level it as much as possible, and then I will make a selection of the best and most suitable grass seeds, and sow them in abundance on it, remembering that I cannot sow too much in order to have full crops immediately, and to prevent the growth of noxious plants; and if any of these should notwithstanding spring up, I must go over my fields and eradicate them, and in a few years I will have a good clean pasture, which will last my life-time, and be retained in the highest state of perfection by means of occasional top dressings, or by scattering some pulverized gypsum over it, and sometimes, perhaps, by a scarification, all which will cost me but a trifle compared with the benefits I shall receive from them.

The late Gouverneur Morris had several dairy establishments on his estate at Morrisania. On the exquisite flavor of the butter they produced, I have often feasted at his table. In rambling over his fields, and visiting his dairies, among the numerous instructive observations he made on agricultural subjects, one was new to me, and I considered it worthy of being remembered, and of having the truth of it investigated. It was this, "The older the pasture, the better will be the milk and butter which it produces." Whether this be correct or not, I cannot from my own experience or observation decide further than this, that some of the most luxuriant pastures about Morrisania, appeared to be very aged, and I knew that the butter they produced was most excellent.

In closing this communication I shall make one further remark. The subjects on which I have touched must be confessed to be important. They stand related to the essence of our highest interests, the productions of our soil. These are to create our wealth, and all our enjoyments thence to be derived. They are therefore deserving of a primary attention. Have the English, who are our school-masters in husbandry, taught us what is suitable to their soil and climate, they have not taught us what is suitable to ours. This is a task belonging to ourselves and deserving of all our application. Let then every practicable method be adopted for ascertaining what grasses are most proper for the pastures and meadows of our country, and what seeds or mixtures of seeds are the most suitable for our various soils. This is a business that should not escape the attention of our institutions, created for the purpose of meliorating the agriculture of our country.

The following are the articles above alluded to.

The art of making good butter is well known, but people generally will not practise it; and for such it is useless to publish any improvements. In order to be wise, it is necessary to know both

good and evil. It will therefore, not be amiss to say something about the art of making bad butter. Although this is generally known, and almost universally practised, still I know some who are yet unacquainted with it; and it is to put them on their guard, as well as to reform others that I make this communication.

In the first place, then, after your churn, and other vessels, have been used in making butter, be sure not to scald them, for hot water will deprive them of the oily substance that will adhere to them, and soon acquire a strong, rancid flavor and taste, which will impregnate every succeeding batch, in the same manner that leaven does in the making of bread. Secondly, keep collecting your cream into one vessel, day after day, until it has made some progress in putrefaction, then churn it, and the business is done. You may work it, and season it, as you please, afterwards, but its constitution is unalterable. The principal quality of which will be a tendency soon to become unfit for any use whatever, in any article of food. When butter is thus made, it will be often beautified with a variety of colours, and possess a rapidly increasing rancidity, which may be agreeable enough to those who have been brought up with it from their infancy, but insufferable to others. And the buttermilk, thus made, is very properly condemned as fit only for hogs. No wonder, then, that buttermilk is abhorred in those parts of our country where such is the method of making it, and no other is known.

(To be concluded in our next.)

Sheep Dogs of Brazil.—For the purpose of shepherding a flock of one thousand, two cur-dogs are sufficient, bred up in the following mode:—As soon as they are whelped, the lambs of a ewe are killed, the puppies are put to her, and she suckles them until she becomes habituated to treat them as her young, when upon opening their eyes and seeing no other benefactor, they attach themselves to her, and play with the lambs as if they were of the same species. Nothing is ever given them to eat; they are shut in the fold with the sheep, on obtaining strength and vigor to attend the flock, they are suffered to go at large, when they accompany it to the field. In a little time, and without more instruction they are so familiarized with the sheep that they never separate from them. When it happens that a ewe lambs in the field, and the lamb cannot accompany the mother, in consequence of its not yet having sufficient strength to follow her, one of the dogs watches near, and if he finds that the lamb cannot follow the mother to the dock, he carries it in his mouth, without doing it the least harm. No other animal or unknown person can approach the sheep of which these dogs are the guardians, without the risk of being attacked. The other domestic dogs and the *chimarro* dogs, are the greatest enemies to the flock; against them, and the birds of prey, which pick out the eyes of the lambs, the vigilance of the watch-dogs is requisite.—*Henderson's History of Brazil.*

Proportion of mutton to the live weight of sheep.—Vancouver states that the sheep-graziers in Devonshire ascertain the proportion of mutton from the live weight of the sheep by multiplying the live weight by five and dividing by nine.—Should the sheep be very fat divide by eight. In general $8\frac{1}{2}$ may be about the mark.

From the National Intelligencer.

DYSPEPSIA.

Messrs. Gales & Seaton.—Seven years ago a case of this afflicting disease occurred, under the immediate notice of your correspondent, which was completely cured in two months by the most simple and efficacious of all remedies, abstinence. It had been brought on by great heedlessness in living, excessive smoking, irregular hours, inactivity, and a free but not very inordinate use of the bottle. The subject was forty-three years old, and of excellent constitution; unconscious of the approach or presence of dyspepsia until it became confirmed, and in all likelihood incurable. He applied to a friend one of the most eminent physicians in Washington, who gave him little hope of an entire cure, at his time of life, but suggested the following plan of regimen, as the only probable means of procuring any degree of relief, viz: to abstain from the use of cigars, from stimulants of all kinds, to keep regular hours, and to keep crackers constantly at hand, of which to eat half a one every half hour, masticating it thoroughly in order to produce as great a discharge as possible from the salivary glands, for the purpose of qualifying the gastric juices of the stomach to promote digestion, and to allay the raging hunger at meal times, which is an invariable symptom, and which may be almost denominated both the cause and the effect of this most unalloyed of all maladies.

The Doctor represented the stomach as being of the nature of gum elastic, or India rubber, which having lost its elasticity, dyspepsia ensues; and that, by keeping this organ constantly, yet gently distended by so salutary an aliment as the crackers form, together with the saliva from the glands of the mouth, occasioned by patient mastication, it slowly recovers its action, its elasticity, and its power to perform the office intended by its place in the system. His patient carefully and steadily observed his directions, got good sleep in the course of a fortnight, which he has enjoyed ever since, (being now about fifty years of age) excepting when other causes operated to prevent it; took to eating his meals regularly, but moderately; in the course of two months, resumed his habit of smoking, and the use of stimulating drinks in some degree, has enjoyed good health ever since, and is growing more fleshy than he ever was before. It should be remarked, that there can be no danger of exhausting the saliva from the glands, for such has been the wise provision of nature, that the whole body is tributary to the reproduction of this most salutary and indispensable agent of digestion; and it is most probable that the exercise of the secretory vessels by which it is conveyed, may assist in promoting the health of the whole system.

I will take the liberty, here, to relate an anecdote which I remember to have read in an old English book, a good while ago.

The custom in that country of permitting the Faculty to make experiments upon convicts is well known. Two subjects of the kind were submitted to the College of Physicians, of age, health and habits, as nearly equal as possible, and they gave to the one bread, soaked in water, as his only food; to the other the same quantity of hard bread and water, requiring him to take them separately; the latter preserved good health: the other pined and died in a few months.

I give this anecdote to show the great use of

mastication, because the misery and torment attending upon indigestion, are wholly inconceivable to all who have escaped it.

PHILANTHROPS.

From Wilson's Economy of the Kitchen Garden, &c.

LIMA BEAN.

The *Lima Bean*, whose excellence, both in point of quality and productiveness, may be considered as almost, if not altogether, without a rival in the vegetable world. The pods are never used. The green beans are shelled, and cooked like green peas, served up to table with drawn butter—and yield, altogether, a deliciousness of repast, of which those who have never tasted, can form no idea. They are very extensively cultivated; and no man, that cultivates any thing, need be at any loss in raising these, for their produce is the most certain of all vegetables here. They are rather the most productive in a strong, rich soil; but they succeed well in all soils, if well laboured and manured.

The mode of preparing the ground for their reception, and the manner of planting, is the same as for the other kinds, except that the hills for this kind, especially in very rich ground, should be four feet apart, every way; and, except in very dry, warm situations, they need not be planted earlier than the middle of May. The seed, if planted early, is sometimes liable to rot, and that is the only accident I have ever seen the plant subject to; but it is easily remedied, by planting over again—and, whenever the plants get fairly above ground, there is no doubt of their future success.

Those planted about the eighth of May begin to produce abundance of beans, fit for table, by the first of August, and continue one uninterrupted succession, from the same plants, during the three following months, or until the commencement of pretty sharp frosts, which, in some seasons, overcome them in October; but I have frequently seen them continue bearing for a week or two in November.

Okra.—The green pods of this plant are very valuable ingredients in soup, and it succeeds here remarkably well. The seed should be sown on a piece of good ground, about the first of May, in drills, four feet apart, and an inch in depth. The best way is, to drop two seeds at every ten inches' distance in the drill; and, when the plants are well up, thin them out so as to leave only one plant to stand at that distance. The ground should be frequently well hoed; and as the plants advance, the earth should be brought up around the bottom of their stems, to a height of five or six inches. The ripe seeds of this plant are frequently used as a substitute for coffee, and are said to be very good for that purpose.

Givin cucumber.—This plant produces a small fruit, about the size of a black walnut, and is used only for pickles, for which purpose it is very much esteemed. Its culture is the same as other cucumbers; but it should be planted, even for pickling, in May, as it seldom produces well, if planted as late as the others are for pickles.

Early Fruit.—An Apricot, measuring three inches and one quarter in circumference, which grew in an open garden in this city, was exhibited last evening at the meeting of the Horticultural Society.—*N. Y. Eb. Post.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 2, 1828.

KIDNEY BEAN—*Phaseolus vulgaris*.

This plant and its uses are too well known to require any description. The sorts mentioned in Mr. Russell's catalogue are kidney dwarfs, or strings; early yellow cranberry—early Mohawk, [which will bear a smart frost without injury]—early yellow six weeks—early Canadian dwarf—early dwarf eluster—early dun colored, or Quaker—early China dwarf—large white kidney dwarf—white cranberry dwarf—red cranberry dwarf—Warrington, or marrow—refugee, or thousand to one—Rob Roy—white cutlass bean of Carolina. Pole or running beans are, large white Luna—saba, or Carolina—scarlet runners—white Dutch runner—Dutch case-knife, or princess—red cranberry—white cranberry—[the three last mentioned string beans], and asparagus, or yard long, *dolichos sesquipedalis*.

The following directions for the culture of the bean in gardens are from McMahon: "Towards the latter end of April, [or the fore part of May, in New England] you may plant a first crop of kidney beans in the open ground. Select a warm, dry, and favorably situated spot, and having dug and manured it properly, draw drill an inch deep, and two feet or thirty inches asunder; drop the beans therein, two inches apart, and draw the earth equally over them; do not cover them more than an inch deep; for at this early time they are liable to rot, if cold or wet ensue. The kinds proper to be sown now are the early cream-colored, speckled, yellow, and white dwarfs."

London gives the following directions for the culture of runners, pole beans, as they are commonly called in this country: "The runner kidney beans may be sown in a small portion towards the end of April, [about the middle of May in New England], if tolerably warm, dry weather; but as these beans are rather more tender than the dwarf sorts, more liable to rot in the ground by wet and cold, especially the scarlets, the beginning or middle of May [first of June in New England] will be time enough to sow a considerable crop; and you may sow a full crop about the beginning of June. Allot principally the scarlet and large white runners. Some Dutch runners are very eligible as a secondary crop. The first crops should have the assistance of a south wall. Intermediate crops may be sown in any open compartment, or against any fence not looking north. The latest sown will continue bearing longer under a good aspect and shelter. In sowing, draw drills about an inch and a half, or not more than two inches deep. Let parallel rows be at least four feet asunder, to admit in the intervals sticks or poles for the plants to climb on. Place the beans in the drills four inches apart, and earth them in evenly the depth of the drills. A row contiguous to a fence or building may ascend upon lines. Some may be sown in a single row along a border, or on each side of a walk, and have the support of a slight trellis of laths and lines; or they might be arched over with similar materials to form a shady walk or bower. In a cold, wet season, or when requisite, to have a few plants more forward than the general crop, some scarlets may be sown in April, either in a slight hot bed, or in pots, under frames of hand-glasses, to raise and forward the plants, till two or three inches high; then, at the end of

May, transplant them into the open garden. As the plants come up, and advance from three to six inches in growth, hoe some earth to the stems, cutting down all weeds. When they begin to send forth runners, place suitable supports to each row; and conduct the tendrils to the sticks or lines, turning them in a contrary direction to the sun. The ascending plants will soon come into flower, podding at the joints, in long succession. They are so prolific, that the returns from three sowings, May, June, and July, will last from July till October.

The pea, English bean, and kidney bean, are liable to the attacks of various insects, especially the aphides, [plant lice] in dry seasons. When early crops are newly sown, or planted, mice will burrow for and eat the seed, and when it begins to penetrate the soil, it is attacked by snails, slugs, the cut worm, &c. The usual means of guarding against the ravages of insects, must, therefore, be resorted to by the gardener.

As regards the field culture of the bean, we would observe, that the white kind, which is most generally approved of in New England, will produce pretty good crops, on poor, sandy, or gravelly soils; but when planted on such ground, it is good husbandry to wet and roll them in plaster before planting. They may be planted in hills, or drills, the rows two and a half or three feet apart, according to the strength of the soil, and cultivated like other hoed crops. They may be planted the latter end of May, or beginning of June, or about the time of planting Indian corn. If planted in hills, they may be placed from fourteen to twenty four inches apart in rows, and the rows the distance before mentioned. Five beans are quite enough to remain in a hill. Hogs' dung mixed with ashes, is said to be the best manure for them; and it is said to be very injurious to beans to hoe them while the dew is on, or in wet weather.

Judge Buel, of Albany, has given the following notices of some experiments, in the field culture of this vegetable: "Beans may be cultivated in drills or in hills. They are a valuable crop; and, with good care, are as profitable as a wheat crop. They leave the soil in good tilth. The China bean, with a red eye, is to be preferred. They ripen early, and are very productive. I cultivated beans the last year in three different ways, viz. in hills, in drill, and sowed broad-east. I need not describe the first, which is a well known process. I had an acre in drills, which was the best crop I ever saw. My management was this: On an acre of light ground, where the clover had been frozen out the preceding winter, I spread eight loads of long manure, and immediately ploughed and harrowed the ground. Drills or furrows were then made with a light plough, at the distance of two and a half feet, and the beans sown along the furrows about the 25th of May, by the hand, at the rate of at least a bushel on the acre. I then gauged a double mould-board plough, which was passed once between the rows, and was followed by a light one-horse roller, which flattened the ridges. The crop was twice cleaned of weeds, by the hoe, but not earthed. The product was more than forty-eight bushels, by actual measurement. The beans brought me one dollar the bushel last fall. The third experiment was likewise upon a piece of ground where the clover had been killed. It was ploughed about the first of June, the seed sown like peas, upon the first furrow, and harrow-

ed in. The drought kept them back—but, about sixty-five rods of ground, on which the experiment was made, gave a product of twelve and a half bushels. The crop was too ripe when it was harvested, and as it was cut with a scythe, I estimated that about two and a half bushels were left upon the ground. No labor was bestowed upon them from the time they were sown till they were harvested."

FACTS.

Condensed from the London Quarterly Journal of Science and the Arts.

Common salt applied as a manure in gardens will quickly destroy snails.

Apples may be kept the whole year round by being immersed in grain, which receives no injury from their contact. If it was universally practised we should hear no complaints of decayed and rotten apples.

All trees with spreading branches accommodate the direction of the lower branches to the surface of the earth over which they extend, and all the branches hold a parallel direction to the earth's surface.

Soap stone powdered fine and mixed with oil diminishes friction, and is an excellent substitute for the usual composition applied to carriage wheels.

100 wt. of raw meat will yield 67 of roast meat or 50 bottled and 200 basins of broth.

To measure the velocity of a cannon ball, let the ball liberate the works of a time-keeper at the moment when it quits the mouth of the piece and make it also stop the time-keeper when it strikes an obstacle.

Ink can be made from a decoction of logwood as well as from an infusion of galls.

It is said by some that the formation of pearls is always due to the introduction of some extraneous substance in the shells of the fish.

The common elm growing in a forest and in good earth acquires its full increase in about one hundred and fifty years, but it will live many ages even five or six-hundred years.

When the upper branches of a tree die, it indicates that the central wood is undergoing alteration and the tree going to decay.

Fine glass bottles containing olives in good preservation were found in the excavations at Pompeii.

A solution of caoutchouc in oil of turpentine used as a size for paper will effectually prevent its injury by mice, humidity or insects.

The roots of an old black-mulberry tree sent forth shoots after lying in an apparently inactive state for 24 years.

Salad herbs may be grown at sea by sowing the seeds on thick flannel well cleansed and moistened. Put that flannel on a board which can be hung up. Place on the flannel on which the seeds are sown another piece of flannel fastened to a thick board. Take off the upper board as soon as the seeds have vegetated, say 24 hours. In six or seven days, if good weather, the crop will be two inches high—it is then fit for use. Be careful to keep the flannel *always wet*.

Notice.

The owner of the Horse Column, recently owned by the Massachusetts Agricultural Society by sending his address to the publisher of the New England Farmer, will hear of something to his advantage. N. B.—Any person knowing the address of the owner will confer a favor by informing the editor as above.

Bellfounder.

The Norfolk trotter, imported July 1822, from England, to stand this season, 1828, at \$20, and \$1 the groom—the money to be paid to the groom. This celebrated Horse is a bright bay, with black legs, standing 15 hands high, with a fine, well known, and active, and excellent trotting shalloon. He is allowed by the best judges in Norfolk, to be the fastest and best bred Horse ever sent out of that county. He has proved himself a sure foal-getter—and his stock for size and substance are not to be surpassed. They are selling at the highest prices of any Horses in Norfolk. Bellfounder was got by that well known fast and high trotting colt, Old Bellfounder, out of Velocity—and on the Norwich road, in 1806 sixteen miles in one hour—and though she broke 15 times into a gallop, and as often round, won her match. In 1809 she trotted 23 miles in one hour and forty seven minutes—and has also done many other great performances against time. Bellfounder at five years old was trotted two miles in six minutes—and in the following year was trotted two miles in five minutes—and in the following year was trotted two miles in four minutes and thirty seconds, which he won easily by 22 seconds. His owner shortly after challenged to perform with him 17 1/2 miles in one hour, but was not accepted. He has since never been saddled or matched. Old Bellfounder was a true descendant of the original blood of the Firro-ways, which breed of Horses stands unrivalled, either in this or any other country. Old Bellfounder is strongly recommended to the public, by the subscriber as combining more useful properties than any other Horse in America; and will stand during the season, at his stable in Charlestown, where all inquiries, (post paid) will be attended to.

May 2 SAMUEL JAQUES, Jr.

Cow for Sale.

A superior Cow, three years old, having had two calves—of English breed, and has given nine quarts of milk per day, without any extra feeding, is offered for sale, at \$75. She is sold on her own farm—it being inconvenient for the present owner to pasture her. Inquire of James Holden, near the Punch Bowl, in Brookline. May 2

Bull, Young Comt.

This noble animal, (of the new improved Durham short horned stock) is from Admiral and Annabelle, presented to the Massachusetts Society for the Improvement of Agriculture, by Sir Isaac Coffin, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in his native State. He will remain at the farm of E. H. Derby, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be used at \$3 for each Cow, payable in advance. The whole proceeds from this animal, (the present season) will be for the benefit of the Society. His services at a distance will be taken care of, if desired, at a reasonable charge.

The pedigree of the Bull Young Comt. raised by E. H. Derby, Dark red, with a few white spots, calved 31 March 1825. Was got by Admiral, dam Annabelle, by Major—grandam, Ada, by Dutton—g. grandam, Aurora, by Comet—g. g. grandam, by Henry—g. g. grandam by Dobby, Admiral, bred by Mr. Wetmore—g. was got by North Star, dam by Comet—grandam by H. Lincoln—g. grandam by Daisy, North Star was by Comet, dam by Biscuit—grandam by Cripple—g. grandam by Fishman—g. g. grandam by Hubbard. May 2

For Sale

At the Agricultural Warehouse, 52 North Market street, a variety of Minnet Boxes, for screening vines and plants from bugs and other insects. May 2

For Sale.

A superior Draught Horse, particularly calculated for a farm horse. Apply at this office, or of Wm. Burrows, near Jamaica Plain, Roxbury. April 25

Bulbous Roots, &c.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbous Roots, suitable for spring planting. Consisting of black, purple, orange, violet, crimson, rose, mauve, bronze, and white colored DOUBLE MEXI CAN BELLANS. Also, Ferrara Bignonia, or Mexican Tiger Flower—Amara, the Peruvian, or Jacobina Lily—Bubble Tuberosa, and Ranunculus; paintings of which may be seen at this place. The above collection of Bulbs is in fine order, and is from the same House from which we obtained the Bulbous Roots last autumn, which gave such uncommon satisfaction.

Just received, a small invoice of Transplanting Trowels for Gardens, made to order, in Edinburgh, of polished cast steel, in the finest style, of different sizes—price, 75 cts. to \$1.50 cts each.

A fine of the Seed of the genuine Chou de Milan, or Milan Cabbage—the finest winter cabbage.

One Box of assorted Scions, of the best sorts of Apples, Pears, Plums, Peaches, and Quinces—carefully packed in clay, for transportation. Price \$4.

1000 Asparagus Sets, two years old, in fine order. Also, English Kidney, and Chienango seedling Potatoes.

A further supply of the celebrated New Zealand Spinach, [*Tetragonia spicosa*].

1000 pounds fresh Lucerne, imported from Europe this spring. Seeds of the Cuba Tobacco, [*Bolho ubero*] Yellow Tobacco, Tenzel, Spring Wheat, Spring Rice, Barley, Rape, Orchard Grass, Spring Lettuce, Green Beans, Corn, French sorts, Wild, Yellow Locust, White Mulberry, Mullet, Barnea, Orchard Grass, Rye Grass, Tall Meadow Oats Grass, White and Red Clover, Mangel Wurtzel, &c.

Also, Seeds for Diers' use—Ornamental Flower Seeds, &c. comprising the largest collection of Seeds to be found in New England.

New Agricultural Works.

Just published, and for sale at the office of the New England Farmer, a Treatise on the Cultivation of Ornamental Flowers; comprising Remarks on the requisite Soil, Sowing, Transplanting, and general Management; with Directions for the general treatment of Bulbous Roots, Green-house Plants, &c. By Roland Kenne. Price 37 cts.

Likewise, just received from New York, a Economy of the Kitchen-garden, the Orchard, and Vineyard; with plain practical Directions for management. By William Wilson, Nurseryman. Price 75 cts.

Also, "Observations on the Efficacy of White Mustard Seed, (*Sinapis alba*) to rot the Smut." From the 10th London edition, revised and improved. Price 6 cts.

Also, "Seventy-five Recipes for Pastry, Cakes, and Sweetmeats. By a Lady of Philadelphia." Price 50 cts.

For Sale or to Let

The three elegant Stall Horses—"Dey of Algeria"—"Ranger," and "Young Highlander"; all bred by the celebrated Horse Highlander. Two full-blooded English Bulls—two Bulls and several Heifers, three and seven-gig-bulls—two Holderness, or Short Horned breed.

Also, two Farms in Tolland, and a convenient House in the central part of the City of Hartford. Inquire at the office of the New England Farmer, or Ralph Watson, East Windsor, Connecticut. April 19

N. DAVENPORT offers for sale at his Nursery, in Milton, a fine collection of Fruit and Forest Trees, and Ornamental Shrubs, comprising Apples, Pears, Peaches, Prunes, Nectarines, &c. Gooseberry and Currant Bushes. A list of which can be seen at the office of the New England Farmer, or Agricultural Warehouse—and will be inserted in the New England Farmer occasionally. At this nursery, however, it is not so much an object to present the imposing display of a great number of the names of indifferent fruit as to keep a choice collection of those sorts, whose excellence is well known and established.

Orders are respectfully solicited, and will receive prompt attention if left with J. R. NEWELL, at the Agricultural Establishment, No. 52 North Market street; or with FRENCH & DAVENPORT, No. 713 Washington Street—or at the Nursery in Milton. Feb. 29

Laudreth's Nurseries—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the procurement of useful & ornamental vegetable productions. The collection now cultivated by them consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green house Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making. In the portion of ground allotted to Garden Seeds are grown almost every variety of Esculent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seedling—in short, the whole process of cultivation, in gathering, &c. will be under their own personal supervision, and they will be anxious to give in a manual degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Codman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15. D. & C. LANDRETH.

New Vegetables.

Just received at the New England Farmer Seed Establishment, a small invoice of rare and choice vegetable seeds, from Europe, comprising (large) the Artichoke of Lunenburg, the finest sort known, but very rare, even in Europe;—Brighton Coss Lettuce—New Silver Giant Celery—Asparagus of Allemagne, a new and superior sort—Creamer Carrot from Holland fine for the table. For sale in packages of 12 1/2 cts each.

Gunpowder, &c.

Du Pont's Gun Powder, at 25 to 50 cts. per pound—Shot—Balls—Flints and Percussion Caps

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street—By E. COPELAND, Jr.

The Du Pont shot as above, is warranted first quality—and is marked "E. Copeland, jr. Boston" on the head of the cask.

Horticultural Botanic Garden.

ANDREW PARMENTER, Proprietor of the Horticultural Botanic Garden, (Brooklyn, Long Island) two miles from New York, offers for sale a very large assortment of the most approved Pear, Apple, Plum, Peach, Cherry, Apricot, Nectarines, Grape vines, &c.; some of them are very handsome Trees—Some Pear Trees on Quince stock, for dwarf, and some Apple Trees on Paradise stock. First Trees of large size, very fine for planting in streets, such as Horse-chestnut, European Lime or Linden Tree, Birch, Larax Ash, Elm, White Poplar, &c. Weeping Willow, Paper Mulberry, Catalpa, Japan Aylantus, Laburnum, Balsam Tamarac, &c. A very large collection of hardy Rose Trees, monthly Roses, Herbaceous plants, Shrubs, &c. and a fine collection of Green-house Plants, such as Strawberries of five kinds, including the mouthily everbearing without runners. Very fine Hawthorn, three years old, at \$6 the thousand. Mr. P. in delivering Trees, will give directions for planting them. Subscribers for one dozen kinds of select table Grapes, containing the White, the Fantablanco, the Yellow-Thomery, the Golden, the Musk, and Royal Chaplains—the White, Violet, Black, and Grey Muscat—the large Maro, and the large Frankenthal, for \$9 the dozen, with directions for planting, cultivation, &c. The vines well packed in moss and mats, in such a manner as to go several hundred miles farther than N. York for cartage, transported in a certain quantity. Grape Vines at 25 cents each in root, for vineyards, warranted to grow. Provisional catalogues can be had gratis, at Mr Charles Swan's grocery and tea store, No. 357 Broadway, or at Messrs Thornburn & Son's, 67 Liberty street, New York, where orders can be left or directed by the Post Office, in his Establishment, Brooklyn. Mr. P. delivers the Trees or Plants in the city, free of expense, by cartage, transported in his cart and carefully taken out and delivered on the place where they must immediately be placed. Orders can also be left with the following Agents: J. R. Newell's Agricultural Warehouse, No. 52 North Market street, Boston—Mr E. W. Ball's Seed Store, Hartford, Conn.—Mr Lewis F. Allen, Buffalo—Mr Luther Tucker & Co. Rochester—Mr William E. Norman, Hudson—and Mr A. B. Allen, Melroe. April 25

PRICES OF COUNTRY PRODUCE.

Table with 2 columns: Item and Price. Items include Apples, Ashes, Beans, Beef, Butter, Cheese, Flour, Grain, Hog's Lard, Honey, Mangel Wurtzel, Wool, etc.

PROVISION MARKET.

Table with 2 columns: Item and Price. Items include Beef, Pork, Veal, Mutton, Pottery, Butter, Eggs, Meal, Potatoes, Cider, etc.

MISCELLANIES.

SIR HENRY WOTTON.

The following is extracted from *Reliquie Wottonianae*, first printed in 1657.—(From the *Boston Literary Gazette*.)

A DESCRIPTION OF THE COUNTRY'S RECREATIONS.

Quivering fear, heart-trembling cares,
Anxious sighs, uncounted tears,

Fly, fly to courts!

Fly to fond wordlings' sports,

Where strain'd Sardonic smiles are glossing still,
And grief is forc'd to laugh against her will;

Where mirth's but mimicry.

And sorrows only real be!

Fly from our country pastimes! fly,

Sad troop of human misery!

Come, serene looks,

Clear as the crystal brooks,

Or the pure azur'd heaven, that smiles to see

The rich attendance on our poverty!

Peace and a secure mind,

Which all men seek, we only find.

Abused mortals! did you know

Where joy, hearts ease, and comforts grow,

You'd scorn proud towers,

And seek them in these bowers

Where winds sometimes our woods perhaps may shake

But blustering care could never tempest make,

Nor murmurs e'er come high us,

Saving of fountains that glide by us.

Here's no fantastic masque, nor dance,

But of our kids, that frisk and prance;

Nor wars are seen,

Unless up the green

Two harmless lambs are botting one the other;

Which done, both bleating run, each to his mother;

And wounds are never found,

Save what the plough-share gives the ground.

Go, let the diving negro seek

For gems, hid in some forlorn creek!

We all pearls scorn,

Save what the dewy morn

Congals upon each little spire of grass,

Which careless shepherds beat down as they pass;

And gold we'll e'er here appear,

Save what the yellow Ceres bears.

Blest, silent groves! O may ye be

For ever mirth's best nursery!

May pure contents

For e'er puth their teats

Upon these downs, these meads, these rocks, these mountains,

And peace still slumber by these purring fountains,

Which we may every year

Find, when we come a-fishing here.

Phrenology.—Mr. Abernethy, in his late course of Lectures, made the following remarks on this science.—“With respect to the supposed possibility of ascertaining men's dispositions and characters from the shape of their heads and faces, I will make one observation—that I have seen various skulls—here is one, for instance—in which you see several considerable elevations on the outside surface, without there being any corresponding depression on the inside. I need not tell you, that where there is no hollow in the skull inside, there could have been no enlargement of brain; and this was an argument used against the phrenologists by Dr. Barlow. Now I don't use it or any other argument against them; I don't let my mind think of the subject at all.—You may do as you like, but I don't care about it; but as I said to Dr. Spurzheim at the very outset,

“Why, Doctor, said I, it may be all very true what you say; but I'll not enter into it;” I don't wish to enter into it; for I think it a very unhandsome thing, a very unfair thing, to judge a man's motives and intentions by his outward appearance at all. Judge of a man by his actions—look to his conduct—see what that is, and you'll not go astray in your opinions. Ah, there is a wise piece of advice, “Judge not, lest yourselves be judged;”—and for you to take it upon you to infer the motives and dispositions of any man, upon any less authority than the tenour of his actions, is a thing that I am sure you have no right to do.”

Powerful Language.—All the performances of human art, at which we look with praise and wonder, are instances of the resistless force of human perseverance. It is by this that the quarry becomes a pyramid, and that distant countries are united by canals. If a man were to compare the effect of a single stroke of the pickaxe, or of one impression of a spade, with the general design or last result, he would be overwhelmed by the sense of their disproportion.—Yet these petty operations, incessantly continued, in time surmount the greatest difficulties; and mountains are levelled, and oceans bounded, by the slender force of human beings. It is, therefore, of the utmost importance that those who have any intention of deviating from the beaten roads of life, and acquiring a reputation superior to names hourly swept away by time, among the refuse of fame, should add to their reason, and their spirit, the power of persisting in their purpose—acquire the art of sapping what they cannot batter, and the habit of vanquishing obstinate resistance, by obstinate attacks.—*Dr. Johnson.*

Extract from a traveller's notes—from the New Hampshire Sentinel.

Joseph Bonaparte.—The citizens' line of coaches through New Jersey, pass the residence of the late king of Spain, at Bordentown, on the Delaware. His estate occupies a large territory. His house is in the French style, but not splendid. His lands, on which immense sums have been expended, are well cultivated. In all public improvements he contributes liberally—something like four thousand dollars, [I am told] he paid on one road. He is much beloved, and his memory will be ever dear to the villagers.

There is scarcely now a poor family in the village, so many does he employ on his lands. He pays liberally—punctually—fulfilling all his contracts—no law suits—no disputes, and the intemperate and immoral are at once discharged. He is constantly, [in the season of agriculture] in the fields with his men, and is constantly with an elegant pruning hatchet in his hand. Strangers who are introduced, partake liberally of his hospitality. He has thus exchanged a coronet of thorns for that of a peaceful agriculturalist, and become a citizen of our happy republic.

Coffee.—The lovers of Coffee may be pleased to learn the origin, which the Persians have given to this delightful beverage. Their belief is, “that it was invented and brewed by the Angel Gabriel to restore Mahomet's decayed moisture, which it did effectually.”

Early Vegetables.—Cucumbers, five or six inches in length, fit for use, have been produced in Montreal.

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

<i>Artichoke</i> , Green Globe	<i>Lettuce</i> , Early Curled Silesia
<i>Asparagus</i> , Devonshire	Large Garden head
Gravesend	Royal Cape
Batavia	Imperial
Large white Reading	Early Green
<i>Beans</i> , Early Yellow Cranberry	Pearly Dutch
Early Mohawk	Grand Admiral
Early Canada's Weeks	Carroll's, or Rose
Early Macedonia Dwarf	Dummesdell
Early China Dwarf	Magnon Bonum Cross
Dwarf Cluster	Leah Cross
White Kidney Dwarf	Ice Cross
White Cranberry Dwarf	White Cross, or Leaf
Red Cranberry Dwarf	Green Cross
Warrington or Marrow	<i>W. Lon.</i> , Green Union
Thousand to One	Pearson
Large White Lima	Nutmeg
Saba, or Carolina	Large Canteleupe
Red Cranberry string	Pompegranet, or Musk
White Cranberry string	Carroll's Water
Broad Windsor	Long Island Water
Field	Apple seeded, Water
<i>Beets</i> , true Long Blood	<i>Marjoram</i>
Early blood Turnip	Almond, White and Brown
Early White Scarcity	<i>Mustard</i>
French Sugar, or Amber	Orange
Orange	Green, (for soups, &c.)
<i>Barrels</i>	<i>Onion</i> , Potatoe
<i>Breeds</i> , Early White	Tree
Early Purple	White Portugal
Large Cape	Yellow
<i>Brussels Sprouts</i>	Madeira
<i>Cabbages</i> , Early Salisbury dwarf	Strasbourg
Early York	Large Red
Early Dutch	<i>Parsley</i> , Siberian
Early Sugarloaf	Dwarf Curled
Early Lion, Batavia	Curled, or Double
Early Emperor	<i>Parsnip</i> , Large Dutch swelling
Early Wellington	Silver Skinned
Large Bergen, &c.	<i>Peas</i> , (4 varieties)
Large Cape Savoy	<i>Peppers</i> , Long, or Cayenne
Large Scotch	Tomato, or Squash
Large Green glazed	Bell
Large late Drumhead	Cherry
Tree, or 1000 headed	<i>Pumpkins</i> , Finest Family
Green Globe Savoy	Common Field
Red Dutch	Manumoth
Yellow Savoy	<i>Radish</i> , Early Frame
Turnip rooted, &c.	Short top Scarlet
Russian	Long Salmon
Late Imperial	Purple Short Top
Late Sugarloaf	Long white, or Naples
<i>Cardoon</i>	Cherry
<i>Carrots</i> , Aittrigham	White colored
Early Horn	White Turnip Rooted
Blood Red (for West India market)	Black Fall, or Spanish
Lennox	<i>Rhubarb</i> , for arts, &c.
Long Orange	<i>Ruta Baga</i> ,
Cramer	Sliced, or vegetable oyster
<i>Cauliflowers</i> , Early and Late	<i>Sca Kale</i> ,
<i>Celery</i> , White solid	Skillet
Rose coloured solid	<i>Scorzera</i>
Italian	<i>Sprout</i> ,
Celeriac, or turnip rooted	<i>Spinach</i> , New Zealand
<i>Cherries</i>	Prickly, or Fall
<i>Corn Salad</i> , or Veticke	Round seeded summer
Cross, Curled or Peppercross	Eng. Patche Dock
Broad leaved or Garden	<i>Sage</i> ,
Water	<i>Squash</i> , Early bush Summer
Long Orange	Long Crook Neck
<i>Cucumber</i> , Early Frame	Vegetable Marrow
Green Cluster	Porter's Valparaise
Short Prickly	Acorn
Long Prickly	<i>Tomatoes</i>
Long green Turkey	<i>Turnips</i> , Early White Dutch
Long white Turkey	Early Garden Stone
White Spined	White Flat, or Globe
Small Gorkin, &c.	Green Round
<i>Egg Plant</i> , Purple	Red Round
White	Sweet's Egg
<i>Endive</i> , Green	Large Eng. Norfolk
White Curled	Long Tankard
broad leaved Batavian	Long Yellow French
<i>Garden Burnet</i>	Yellow Dutch
<i>Garlic Sets</i>	Yellow Maltese
<i>Indian Corn</i> , (several varieties)	Yellow Aberdeen
<i>Kale</i> , Sea	Yellow Stone
Purple curled	Yellow Swedish
Green curly Scotch	<i>Thyme</i> —Street Basil—Bonnet
Leek, London	<i>Lovage</i> — <i>Rosemary</i> — <i>Hyslop</i>
Large Scotch	<i>Wormwood</i> — <i>Savory</i>
	<i>Penny royal</i> — <i>Spikenard</i> — <i>Dill</i>
	<i>Rub.</i> — <i>Tansy</i> — <i>Bene</i> , &c.

AGRICULTURE.

[Extracts from London's Encyclopedia of Gardening.]

BRUSSELS SPROUTS.

This plant produces an elongated stem, often four feet high, from the axle of the leaves of which sprout out shoots that form small green heads like cabbages in miniature, each being from one to two inches in diameter, and the whole ranged spirally along the stem, the main leaves of which drop off early. The top of the plant resembles that of a savoy planted late in the season; it is small, and with a green heart of little value. Van Mons says "if this vegetable be compared with any other which occupies as little space, lasts as long, and grows as well in situations generally considered unfavorable, such as between rows of potatoes, scurlet runners, or among young trees, it must be esteemed superior in utility to most others." Nicol considers it as deserving more general culture in Scotland; and Morgan says, "it is an excellent sort of winter green for the table, but not sufficiently hardy to last through the winter in England.

Use. The sprouts are used as winter greens—and at Brussels they are sometimes served at table with a sauce composed of vinegar, butter, and nutmeg, poured upon them hot after they have been boiled. The top is very delicate when dressed, and quite different in flavor from the sprouts.

Culture. The plants are raised from seed, of which an ounce may be requisite for a seed bed four feet by ten. The seed is sown in spring under a frame, so as to bring the plants forward—they are then transplanted into an open border with a good aspect. The plants need not be placed at more than eighteen inches each way, as the head does not spread wide, and the side leaves drop off.

Gathering the crop. It is usual to cut off the top about ten or fifteen days before gathering from the stem. In spring, when the sprouts are disposed to run to flower, their growth is checked by taking up the plants, and laying them in the ground in any shaded spot.

CAULIFLOWER.

This is one of the most delicate and curious of the whole of the brassica tribe—the flower-buds forming a close, firm cluster or head, white and delicate, and for the sake of which the plant is cultivated.

Use. These heads or flowers being boiled (wrapped generally in a clean linen cloth) are served up as a most delicious dish. "Of all the flowers in the garden," Dr. Johnson used to say, "I like the cauliflower." Its culture, however had been little attended to till about the close of the 17th century; since that time, it has been greatly improved. For an early supply for the London market, great quantities are fostered under hand-glasses during the winter and first part of spring; and to behold some acres overspread with such glasses, gives a stranger a forcible idea of the riches and luxury of the metropolis.

Propagation and soil. The cauliflower is raised from seed, of which half an ounce is sufficient

for a seed bed four feet and a half wide, by ten in length. The soil for the bed may be light; but for transplanting, it can hardly be too rich, the cauliflower like the vine, being reputed a rough feeder. Clo-nings of streets, stables, cess-pools, &c. ought, therefore, to be liberally supplied during the growth of the plants, when very large heads are desired.

GARDEN CRESS.

This is a hardy annual plant, cultivated since 1548; but its native country is unknown. The cultivated plant rises with numerous small long leaves, curled or plain: from which proceeds a stalk from fifteen to twenty inches high, furnished with white flowers, which blossoms in June and July. The whole plant partakes strongly of the pungent smell and acid taste which distinguish the Cruciferae.

Use. It is cultivated in gardens for the young leaves, which are used in salads, and have a peculiarly warm and grateful relish. It ranks among gardeners as the principal of the small salads.

NASTURTIUM.

A hardy annual native of Peru, introduced in 1686. The stalks, if supported, will rise eight to ten feet high. The flowers are very showy, of a brilliant orange color, and continue in succession from July till destroyed by frost. In its native country, it endures several seasons; but here, being unable to sustain our winter, it is treated as an annual, and requires to be sown every year.

Use. The flowers and young leaves are frequently eaten in salads; they have a warm taste, like the common cress. The flowers are used as a garnish to dishes, in which they form a brilliant contrast to the flowers of horace. The berries are gathered green and pickled, in which state they form an excellent substitute for capers.

BORAGE.

An annual, and sometimes a biennial plant, with the lower leaves oblong, alternate, and spread on the ground; the flower stem rises nearly two feet high; and, with the leaves, is rough with white bristly hairs. The light blue flowers make a beautiful appearance, and are produced for several months in succession, beginning with May.

Use. The young leaves and tender tops are used occasionally as salads, and to furnish a boiled dish in summer and autumn. The spikes of the flowers form an ingredient in negus and cool tankards, and the blossoms are occasionally employed as a garnish. The juice of the plant affords nitre and the withered stalks have been observed to burn like match-paper.

ENDIVE.

This is a hardy annual, a native of China and Japan, and introduced in 1548. The root-leaves are numerous; the stem rises about two feet high, is branched, and produces pale blue flowers in July and August.

Use. It is cultivated for the stocky heads of leaves, which, after being blanched to take away the bitter taste, and used in salads and stews in autumn, winter, and spring. It is in great repute both in England and on the continent.

[From Memoirs of the New-York Board of Agriculture.]

OBSERVATIONS ON CONSTRUCTING A GREEN HOUSE.

By JOHN W. WATKINS, Esq.

The building should be sunk in the earth from two to four feet, in proportion to the size of the house, and according to the nature of the soil; as clay retains moisture, and of consequence produces damp, in such ground it should not be so deep. The height should not exceed twelve feet from the exterior ground, by which it will be less exposed to high winds. The width should not exceed sixteen or eighteen feet, as the sun's rays are at that distance from the glass very feeble. A south front is well known to be the true one, but advantage should be taken of glassing as much of the eastern end as possible, for the benefit of the morning sun. The front should decline northward from a perpendicular with the horizon, so as the angle made thereby with the horizon, will at noon day in winter, bring the rays of the sun to strike the glass at right angles, and the roof should descend the opposite side without a break. By this position of the roof and glass, the rays of the sun are thrown upon every part of the inside of the house, and the whole becomes heated thereby; more of the rays are also introduced into the building, and when the sun produces most heat during the day, there is no reflection of its rays, and at other parts of the day, the reflecting angle being obtuse, does not powerfully cast off the rays. The inside of the rafters of the roof, should be lined with boards, and the space between that and the roof filled with a mixture of straw, sand and clay made into mortar; boards should be used in preference to shingles, as making fewer breaks in the roof, less opportunity is given for the admission of cold air. The residue of the building may be of stone or brick work, or a frame building filled in with bricks, and no flooring of any kind upon the ground. Shutters on the outside are sufficient, and it is preferable to have them hung on hinges, as the least troublesome, to the common practice of sliding ones; they should be made to fold into the spaces between the windows.

Before putting the plants into the house, the bottom should be covered with bark from a tan vat, about a foot deep, according to the depth the building is sunk into the earth.

The advantages proposed by this method of constructing are, the lessening the expense of building, that the heat of the sun being sufficient to warm the house, the trouble and expense of warming it by a stove is avoided, which unless very carefully attended, the plants may be injured by too much heat, and are always by the smoke that unavoidably makes its way out of the pipes. It would be proper nevertheless, to make arrangements in constructing the house for using a stove, in case a long succession of cold cloudy days, by obscuring the sun, should reduce the heat in the house, below that degree of temperature necessary for preserving the plants, which is a case that will seldom happen, as one clear day will warm the house sufficiently to admit its being shut up for several days.

Plants in a house of this kind require less water, and do not suffer for the want of atmospheric air. It is probable, as the earth is charged with electric fluids, as vegetable substances are known conductors of it, that the bark by its fermentation, not only generates heat, but serves as a mean to produce out of the earth an atmosphere for the plants, sufficient with such atmospheric air as will find admission, to supply the quantity exhausted, by the daily rarefaction occasioned by the sun's heat.

A green house has been used upon this construction in this state, without having had the least occasion of being heated by fire. The plants in the spring were remarkably thrifty; tropical fruit ripened in it during the winter, and young fruit formed on the trees. It required no other care, than now and then watering the plants, and shutting the windows as soon as the sun left them.

Cattle Show. Exhibition of Manufactures, Ploughing Match, and public sale of Animals and Manufactures, at Paxtuxet, R. I. on Tuesday and Wednesday, the 21st and 22d of October, 1823. The Standing Committee of the Rhode Island Society for the Encouragement of Domestic Industry, offer the following Premiums:

FOR STOCK.

For the best Bull to be kept in the State, one year after the Fair, \$15—the next best, 12—the next best, 10.

For the best Bull Calf, \$8—the next best, 5—the next best, 3—the next best, 2.

For the best Cow, \$10—the next best, 8—the next best, 6—the next best, 4—the next best, 2.

For the best two year old Heifer, \$8—the next best, 6—the next best, 4—the next best, 2.

For the best Heifer Calf, \$4—the next best, 2—the next best, 1.

For the best Ox, fatted in this State, regard to be had to, and a particular statement to be given of the mode, and expense of fattening, \$10—the next best, 8—the next best, 6—the next best, 4—the next best, 2.

For the best pair of working Cattle to have been owned in this State at least three months, \$8—the next best, 6—the next best, 4—the next best, 2.

For the best pair of three years old Steers, \$6—the next best, 4—the next best, 2.

For the best two years old Steers, \$5—the next best, 3.

For the best Ram, \$10—the next best, 8—the next best, 6—the next best, 4—the next best, 2.

For the best Ewes not less than six in number, \$6—the next best, 4.

For the best Boar, to be kept in the State till the 1st of April, 1824, \$10—the next best, do. 5—the next best, 3.

For the best Pigs, not less than two in number, nor less than four months old, nor more than eight months—to have been raised in this State, \$10—the next best, 4—the next best, 2.

For the best Colt, not more than one year old, \$15—the next best, do. 12—the next best, 10—the next best, 8—the next best, 5.

No Stock from distilleries or breweries, will be entitled to any premium. No animal on which a premium has heretofore been awarded, shall be entitled to a second premium, except it be for an entirely distinct premium, and for qualities different from these for which the former premium was awarded.

GRAIN, VEGETABLE CROPS, AND AGRICULTURAL EXPERIMENTS.

To the person who shall raise the greatest quantity of Indian Corn, on not less than 4 acres in

one piece of ground, \$20—next greatest quantity, on not less than 1 acre of land, 10—next greatest quantity, 6.

To the person who shall raise the greatest quantity of Barley on not less than 2 acres, \$8.

To the person who shall raise the greatest quantity of Onions, in proportion to the land cultivated, \$5—next greatest quantity, 3.

To the person who shall raise the greatest crop of Millet on an acre, cut and cured for hay, the claimant giving evidence of the time of sowing, and the quantity of hay produced, \$10.

To the person who shall raise the greatest quantity of vegetables, [grain, peas and beans, excepted] for winter consumption, of the stock on his own farm, and not for sale, in proportion to the size of the farm and stock kept, having regard to the respective value of the said vegetables as food, stating the expense of raising the same, and the best mode of preserving the same through the winter, \$15.

To the person who shall raise the greatest quantity of Potatoes, on an acre of land, \$10—next greatest quantity, 8—next greatest quantity, 6.

To the person who shall raise the greatest quantity of Mangel Wurtzel, on not less than a quarter of an acre, \$5—next greatest quantity, 3.

To the person who shall raise the greatest quantity of Sugar Beet, on not less than a quarter of an acre, \$5.

To the person who shall make the most satisfactory experiment, to ascertain the best mode of raising Indian Corn, in hills, in rows, or in ridges, not less than half an acre being employed in each mode, in the same field, the quantity and quality both of land and manure to be equal and uniform in each mode; all to receive a cultivation requisite to produce a good crop, \$12.

To the person who shall introduce any Grass, not before cultivated in this State, and prove by actual experiment, tested by satisfactory evidence its superiority to any other grass, now cultivated, \$20.

To the person who shall, by actual experiment, prove the best season and modes of laying down land to Grass, whether spring, summer, or fall seeding be preferable, and with or without grain, on different soils, \$10.

To the person who shall raise the best Celery, not less than 6 bunches, 3.

Neither of the above crops to be raised on land where the same crop was raised the year previous.

To the person who shall take up in the season, on his own farm, the greatest quantity of good Honey, and shall at the same time exhibit superior skill in the management of bees.

For the best specimen of Cider, to be exhibited in bottles, not less than 12 in number, \$8—next best, 6—next best, 4—next best, 2.

A premium for the best Cider will be offered at the Fair succeeding this. Persons claiming a premium, must state in writing, the process of making and managing their cider, and the kind of apples used.

Competitors for the above premiums must furnish the Secretary, on or before the Dec. 1st 1823, with written statements, certified by disinterested and respectable persons, as to the following particulars: 1st The state and quality of the land in the spring of 1823. 2d The product and general state of cultivation and quantity of manure employed on it in the year preceding. 3d The quantity of manure used the present season. 4th The

quantity of seed used, and if potatoes, the sort. 5th The time and manner of sowing, weeding and harrowing the crop, and the amount of the product, ascertained by actual measurement,—after the whole produce for which a premium is claimed is harvested, and the entire expense of cultivation.

The statement of crops must also be accompanied by a certificate taken under oath, of two persons who assisted in measuring them, as well as with the certificate of a surveyor of the measurement of the land, together with a plat of the same.

FOR SHOP MANUFACTURES.

For the best Side of Sole Leather, with a written statement duly certified, of the mode and time of tanning, \$4—the best Belt Leather, 4.

For the best white oak Hogshead, \$4—the best white oak Barrel, 2.

For the best imitation beaver Hat, \$3—the best woollen Hat, 1.

For the best cast-steel Rollers, not less than 8 in number, \$5.

For the best throstle Spindles and Flyers, not less than twelve, \$5.

For the best Mule Spindles, not less than 12, \$5.

For the best top rollers, \$5.
Three dollars to each of the following Implements: Best cast-iron Plough—best Horse Harrow—best Corn Sheller—best Apple Parer—best Straw Cutter—best Ox Wagon—best Ox Harrow—best Vegetable Cutter.

Three dollars also to each of the following, not less than 12 in number: Hoes, Siftes, Fly Shutles, Iron Shovels, Axes, Rakes, Morocco Sheepskins, Top Rollers, Leathern.

Implementations of Husbandry, and articles of Shop Manufacture of superior excellence, not particularly enumerated, may receive premiums at the discretion of the Examining Committee.

BUTTER, CHEESE AND HOUSEHOLD MANUFACTURES.

For the best Cheese, all from the same dairy, not less in quantity than 100 pounds, \$8—next best, do. 6—next best, do. 4.

For the best Butter, not less than 10 lbs. \$8—next best, 6—next best, 5—next best, 4—next best 3—next best, 2.

For the best Bonnet manufactured of native straw or grass, \$6—next best, 4.

For the best piece of Carpeting $\frac{1}{4}$ wide, and not less than 15 yds. \$6—next best, 4—next best, 3.

For the best lot of woollen knit Hose, at least three pair, \$2—best flax or hemp, do. 2—best cotton or woollen, do. 2—the best cotton or worsted, do. 2.

For the best piece of woollen Flannel, $\frac{3}{4}$ wide, 20 yds. at least, \$5—best do cotton and woollen do. 5.

For the best piece of woollen cloth fulled, dressed $\frac{3}{4}$ wide, and 16 yds. long at least, \$5.

All to have been manufactured in this State and within the last year, and a certificate thereof required.

MILL MANUFACTURES.

For the best piece of Broadcloths $\frac{3}{4}$ wide, and 14 yds. long, at least, \$8.

For the best piece of Plains, 20 yds. at least, \$6.

For the best piece of Kerseymer, $\frac{3}{4}$ wide, and 20 yds. at least, \$6.

For the best piece of Satinet, $\frac{3}{4}$ wide, and 20 yds. at least, \$6.

For the best piece of Red-ticking, at least 28 yds. \$3.

For the best bale or box bleached cotton Shirts, over No. 25, 18 pieces, \$15.

For the best bale or box brown do. from 12 to 20, yds. \$15.

For the best piece of woollen Flannels, 25 yds. at least, \$5.

For the best do. of cotton and woollen do. \$5. For the best case of Calico, \$10.

All to have been manufactured within the last year, and in mills owned by citizens of this State.

PLOUGHING MATCH.

1st plough, \$10—2d plough, 9—3d plough, 8—4th plough, 7—5th plough, 6—6th plough, 5—7th plough, 4—8th plough, 3—9th plough, ..

One dollar to each of the ploughmen.

The depth to be ploughed will not be less than five inches, and the breadth of the furrow not more than twelve inches.

The strictest regulation will be adopted to ensure the proper management of the cattle. They will not be permitted to be driven faster than their natural pace; and these premiums will be adjudged for the best work with least expense of labor.

It must be understood, that in all cases, whether there be any competition or not, it is at the discretion of the Committees to withhold a premium, if in their opinion the object so offered is not deserving of reward.

Any attempts to obtain premiums by unfair practices will be punished by a forfeiture of the premium, should it have been awarded before a discovery, and will also preclude the offender from being permitted to apply for premiums in future. Premiums not demanded within six months after they are awarded, will be considered as given to promote the objects of the Society.

For the Standing Committee.

JAMES RHODES.

LUCERNE.

It is a fact worth mentioning, to show the earliness of this new grass, that it is now 24 inches high, and nearly in blossom, on the farm attached to the House of Industry, (at South Boston). Mr. Stone, the intelligent Superintendent, informs us, it fully answers his expectations, on a rich deep loam; but, that on a hard soil, it has succeeded but indifferently, being now about six inches high. A beautiful field of Lucerne, of about the same height, can be seen at Mr. Lowell's farm, in Roxbury.—*Ed. of the N. E. Farm.*

FOR THE NEW ENGLAND FARMER.

THE STATE OF THE SEASON.

MR FESSENDEN—I have for 14 or 15 years, regularly given an account of the season, so far as it respected the flowering of plants. It is always a subject of discussion, and though we cannot prove, that there is any immediate advantage derived from it, yet it has been recommended by many eminent naturalists, and cultivators of natural science. I consider it rather in the light of an innocent curiosity, about as useful as meteorological observations. We cannot control the weather by the one, nor the productiveness of plants by the other.

From the unusual openness of the winter, and the early promises of spring, we were led to expect an unusually forward state of vegetation. In

the Southern States this expectation was realized to their cost. Late frosts, as might be expected, have blasted the hopes of the horticulturist, and there seems to be an apprehension that frosts will be cut off. These fears, however, are often prematurely expressed, and nature or the Providence of God often proves more kind than the rash conclusions of men from adverse appearances would seem to warrant. With us, the season has been so far very auspicious. Moderate cold has checked vegetation, and the invaluable frosts for food and luxury have been so far kept back, that we have a reasonable ground of hope, that the succeeding season will be prolific beyond any late example. The present season, compared with the last six years which have been all early ones, is by no means precocious, or very early, as the following calendar will prove. I repeat, that the reference is made solely to my own place, and to the same trees. Any difference, which may, and probably does exist, in other trees of the same sort, does not in any respect, vary the question as to the comparative forwardness of the season.

In 1822 apricots opened their flowers, April 21

1823	"	"	"	20
1825	"	"	"	11
1827	"	"	"	12
1828	"	"	"	20

CHERRIES.

In 1822 early cherries opened May 1

1823	"	"	"	7
1824	"	"	"	1
1825	"	"	April 23	
1826	"	"	May 4	
1827	"	"	April 21	
1828	"	"	May 1	

So that it appears that cherries were as late or later this year than in an average of six years last past.

PEACHES.

In 1822 peaches opened May 4

1824	"	"	"	12
1824	"	"	"	4
1825	"	"	April 25	
1827	"	"	"	20
1828	"	"	"	30

So that, as to peaches, the present season is only about an average one.

The same remarks will apply to the pear, asparagus, and garden flowers. The present season is very happily not a very early one. I say, happily, because permanently, we cannot rely on secure weather, till the middle of May, and any superior earliness is usually followed by disappointment.

Grass and grain look well. Trees generally show promise of most abundant blossom. For forty years my own peach and pear trees never promised better; but there are severe trials after this date, though they are rare.

A ROXBURY FARMER.

Roxbury, May 5, 1828.

Roxbury, May 5, 1828.

MR. EDITOR,—In speaking of Mr. Knight's donation, I said that I should show no favor in the distribution. I beg leave to qualify this declaration. On their first arrival, as the preservation of each variety is important, I shall select such persons in the vicinity, as I know to be careful, and successful cultivators, to take part of the first grafts. I shall choose men, who will freely distribute them gratis. Another rule will be, not to

give to persons who raise plants for sale, an undue proportion, though it is my opinion, that one of the best means of propagating them is to give them to professed nursery-men, whose skill and interest will ensure their success and distribution. I make these remarks, in order, that those who raise for sale, may not expect an undue share of these plants, which were given freely by Mr. Knight, and which in the spirit of his gift, I feel equally bound to make as free as water or air.

J. LOWELL.

May 7, Postscript. The plants have been unpacked, and I am sorry to say, that they have all pushed too much to make it certain they will succeed. The grafts, especially, will be in great danger, and many will be lost, and I am still more sorry to say, that all the varieties of pears numbered from 1 to 15, are grafts and therefore in great danger. There were six pear trees, and the labels had fallen from all but one. No 5, owing to the rotting of the twine which attached the labels. The apple and cherry are known, by their being but one. The Lowell pear is also identified by its being the only one which had its own scions attached to it, though the label had fallen from it. I omitted to mention that the Lowell pear does not ripen in England till May. No effort on my part shall be wanting to preserve these varieties, though I fear several will fail—but Mr. Knight will replace them. I find by an endorsement in Mr. Knight's hand writing, that this identical box with the same fruits was sent March 8, 1827, to Chester, to be shipped to Liverpool, but by the neglect of the wagoner, they were left at Chester some months, then returned by land to Mr. Knight, at double expense of carriage, and were found to be all dead. This, therefore, is the second transmission of the same plants—so omitting is his kindness.

J. LOWELL.

GOOSEBERRIES.

In all cases, the gooseberry should be kept free from suckers, and trained near the ground to a single stem. This mode of training them being found to cause a far greater product in quantity, as well as an increase in the size. They need much attention in other respects, and one third of the old wood must be regularly trimmed out every autumn, by which means a succession of thrifty bearing wood will be kept up. As the finest fruit is produced on the young shoots of the previous year's growth, it is also necessary every autumn, to dig in a plenty of old well-rotted manure, around them. This treatment will cause them to grow strong, and the fruit to be large and fair. Where the summers are very hot, a northern aspect is preferable, and the fruit will be twice the size if they are planted against a north fence, or in any other situation where they are sheltered from the intense heat of the noon-day, which, when differently situated, often scorches the fruit to such a degree as to entirely stop its growth.—*Am. Far.*

A friend has laid upon our table, [says a Balti more p. of April 25] several stalks of rye headed out; that were taken from a lot of about three acres, six miles from town on the Hartford road, the whole of which is in the same state. We do not remember to have seen any thing of the kind so early in the season—the parts of stalks, we have seen are from two feet to two and a half long.

[From Memoirs of the New York Board of Agriculture.]

ON THE MANUFACTURE OF BUTTER AND CHEESE.

BY S. DE WITT, ESQ. OF ALBANY.

(Concluded from page 325.)

In the counties of Ulster and Orange, celebrated for the excellence of their butter, in the New York market, the utmost attention is paid to cleanliness. Their strainers, churns, creaming vessels, bowls and ladles, are, as often as they are used, washed, scalded and scrubbed, and the milk rooms, which are commonly dry, airy cellars, without wooden floors, are kept very free from any thing in the least offensive. The milk is carefully strained, and as soon as the cream is completely formed, it, together with the cream, is emptied into the churn, when the churning is immediately commenced, and continued, with short intervals, till the butter is come. The butter is then taken off with a ladle made for the purpose and kept exclusively for the service, and put into a large wooden bowl, where, with the same ladle, the whey, or rather buttermilk, is thoroughly worked out of it. No hand or finger is ever suffered to come in contact with it. Where dairies are any way considerable, churning is a daily operation, and done early in the morning, especially in summer.

There is a period when cream will be completely formed, and be in its highest perfection, after which it will deteriorate, and should not be suffered to remain unchurned. Inattention to this is one of the principal causes of the bad quality of butter.

In this manner is, not only the best butter, but also the best buttermilk obtained; which, besides affording an excellent beverage, makes, with the addition of a little sugar or molasses, and rusk or good bread broken in it, a dish to crown the farmer's dinner, more refreshing and more exquisitely relished than the strawberry flavored ice creams of the luxurious rich.

There are a few, and it is sadly to be lamented, yet but a few, farmers left in the country surrounding Albany, who manage their dairies in this manner; But their butter is mostly all pre-engaged, at twenty five cents per pound, by their *oldtime* acquaintances, who cannot help recoiling at the sight and smell of what is generally brought to our market, and with difficulty sold for eighteen cents. This fact, it is true, is not very creditable to our country, but it is, notwithstanding a fact. Every citizen knows that it is extremely difficult, in Albany, for a family to get a supply of *etable* butter. But where the object is to cure an evil, it is necessary that it should be pointed out and correctly described, whatever effect such a procedure may have on the feelings, reputation or interest of those whom it may immediately concern. Such things affect the general interest as well as the character of our country, and therefore it is proper that they should be faithfully exposed, and duly attended to.

The making of butter, one would suppose, were well understood in the vicinity of Boston; and yet there is no market in any of the large capital cities in the United States, so noted for the bad quality of its lump-butter as this very city of Boston. Philadelphia has been long celebrated for the uniform excellence of its butter, and its clean and wholesome appearance in the market. In New

York many individuals, with laudable liberality, have recently awarded premiums for the best butter brought into that city for sale; which it is said, has produced an obviously good effect in the general quality of the article.

It deserves consideration, whether our Agricultural Societies, alive as they are to every thing which will benefit our reputation, and whilst they are granting premiums for raising the best cattle for dairies—should not also bestow some attention on the manufacture of butter and cheese.

It is useless to possess good cows and good milk, if the butter which is brought to market, is only a disgrace to the farmers. We hope the Massachusetts Agricultural Society may be induced to offer a premium for the best butter which may be brought to market, by any individual dairy during the summer months.

Mode of making butter, as it is practised in the neighbourhood of Rennes, in Brittany, where the best butter in France is made—milk is composed of three parts, essentially different from each other; they are as follows:

1st. The aqueous part, called whey, which is very acid.

2d. The cheese part, which is substantial.

3d. The butter part, called cream, of an oily nature, and which comes up naturally to the surface of the milk, even before its decomposition.

It is this cream that is turned out into butter by churning.

In order to make good butter, the decomposition of milk must have begun; I mean its three parts must be exactly separated, as it happens when it begins to turn sour. Milk must necessarily be sour before beginning to churn; but it is urgent to churn it as soon as it is sour; and not to wait its fermentation.

It must have curdled and soured of itself without fire. In the winter season, however, it is proper to pour a little sour milk into it to make it coagulate.

Though the cream is the elementary part of butter, and neither the whey nor the cheese part contain any of it, yet it is necessary to throw into the churn the three parts of the milk, and to churn them altogether. The reason of it is evident. The churning, which must be always uniform and continual, communicates a slight degree of heat, which would give a disagreeable taste to the butter, if the cream were churned alone; while churning the whole together, the acidity of the whey tempers the heating effects of the churning, the cheese part helps the separation, and the butter comes fresh out of the churn. It is to preserve the fresh taste, that in summer our butter women, as soon as they see the small globules of butter beginning to form, do not fail to throw into the churn (by the hole of the churn staff, and without stopping the churning) some pints of spring water every ten minutes, that is, a pint to every fifty or sixty pints of milk; in winter, on the contrary, they add warm water, but they pour it in as soon as they begin to churn, in order to accelerate the slight degree of heat necessary for the formation of butter; but when they perceive the first butter-globules forming round the churn-staff, then they cease pouring warm water, and the temperature warms them putting any more cool water. Thus, to make butter it is required—

1st. That milk must have curdled and soured, but not fermented.

2d. That milk must have naturally soured, with-

out any help but a little quantity of sour milk, and especially without warming it.

3d. That all milk should be put into the churn together, and churned without extracting any parts of it.

4th. That the churning should be continual and always uniform, avoiding to strike the bottom of the churn.

5th. That churning, without interruption, communicates to the milk a slight degree of heat, which is necessary, and which in winter may be accelerated, by adding some warm water from the moment one begins to churn, and without stopping the churning motion.

6th. As soon as one perceives the little globules of butter forming, one must then think only to cool, with spring water, if in summer, for in winter, it is not necessary.

7th. If, when one wishes to churn, one has some sweet milk not yet sour, but which one wishes to churn, it must be put into the churn with the curdled milk twelve or fifteen hours, more or less, according to the relative quantity, before beginning to churn, in order that the part of sweet milk you have added be entirely curdled.

8th. This mode is, no doubt, much longer than when the cream alone is churned; for one must churn during about two hours in the most favorable season, and it is common in winter to take four hours churning to have your butter made.

Preparation for butter. When butter is made, if the weather is hot, it is well, after having gathered it in the churn, to let it cool about two hours; but when it is very hot weather, as that time is not sufficient to cool it, it is well to put it in a very cool place during some hours, till it is very firm, in order to extract the buttermilk out of it.

It is by kneading and repeatedly with a wooden box spoon, and a beech dish made of one piece, that the women about Rennes extract the buttermilk; leaving it now and then to rest and grow hard, and then beginning again till it does not yield any buttermilk; it is only in the last extremity, and in the hot days of summer, that they knead it in cool water in order to extract the buttermilk out of it: they put nothing in it, but some salt for preserving and relishing it.

They never touch the butter but with the wooden box-spoon, which must be impregnated, and also the dish, with some light brine to prevent the butter from adhering.

All the utensils employed for milk must be carefully washed with boiling water every time they have been made use of, then washed again with cool water and exposed to the sun, that they do not get a musty smell. It is necessary to remove from the dairy all the disagreeable or strong smells, and to observe the most scrupulous cleanliness in it, but without humidity, which would give a mouldy taste to milk.

The churn is made of chestnut wood; it is scalded every time it is emptied to churn again; it is rubbed with a bunch of holly-oak, that scratches and cleans it well; and then washed again with cold water.

The pots and churn must keep no smell of the sour milk, and none of the utensils employed should be or have been put to any other uses, for fear of spoiling the whole.

Assamese method of blasting rocks.—An Assamese stone-cutter has shown me a mode of blasting rocks, which I think is superior to any thing

practised in England. The old mode of ramming has, you know, been superseded of late, by the use of loose sand poured over the powder; but whatever may be the case with the softer description of rocks, I have always failed in this way, here, except in one instance; probably owing to the excessive strength and hardness of the granite and primitive greenstone, on which the experiment has been tried at least a dozen times, and in holes nearly a foot deeper than is stated to be necessary in the "Supplement to the Encyclopedia and Philosophical Magazine," where the method with sand is described. The following is the result of the Assamese plan:—A hole was bored about twenty-six inches deep, and one and a half inch diameter in a large block of greenstone. It was tried to blast this rock with powder and loose sand, and the latter was blown out. The same quantity of powder was again put in, and the mouth of the hole closed with a wooden plug, about five inches long, with a hole bored through it, and driven into the aperture with a mallet. Between the powder and the lower part of the plug an interval of several inches was left, and the communication was perfected by means of a tin tube filled with powder, and passed through the centre of the plug. On firing it, the rock was rent in every direction, to the distance of four feet—and several large pieces were detached, one of them weighing fully a ton. The advantages are, that the plug is as safe and more efficacious than the sand, and that with it, the charge, if it goes out may be easily replaced; whereas, with sand it becomes necessary to have recourse to the tedious operation of again scooping out the hole. The great effect produced, is, I conceive, chiefly owing to the interval left between the charge of powder and the plug, as it is well known to sportsmen, that a gun will burst, if the ball or charge is not properly rammed down.—*Edinburgh Journal of Science.*

From the Delaware Advertiser.

SILK WORMS.

It certainly constitutes a source of lively interest to every true patriot and philanthropist, when we reflect upon the prosperous condition of this highly favored country, enjoying as it does numerous advantages and various blessings, among which is independence. We also possess an immense territory, and our population is rapidly increasing. With the spread of knowledge in the various arts and sciences, we find it necessary to pay attention to agricultural improvement. The silk-worm, and manufacture of silk, would no doubt be one of the most sublime improvements in this vast and well adapted country, and would be a lasting benefit to every citizen, whatever may be his age or condition—to the emigrant—rich or poor, and finally, would be an inexhaustible source of wealth to our government.

But we should not commence this great work without mature deliberation, or we shall never attain to any thing of consequence. We may induce many to turn their attention to the growing of mulberry trees, and the raising of silk-worms by offering premiums, or trying every imaginary experiment by the aid of books written by eminent authors either in Europe, or this country;—but the disappointment will appear in the practical way. That proceeding will be entirely vain to obtain the desirable object of a mercantile silk. A preparation for the culture of that article cannot

be made in less than four years—when we shall be ready to commence. During the four years which it will be necessary to allow the industry to come to perfection, the ground so occupied may be tilled in the ordinary way, and produce annual crops of corn, tobacco, cotton, &c. but less time than this, will not answer to ensure permanent success.

My experience in the science of agriculture has been derived from a devotion of many years of my life to its pursuit in Europe, where I obtained the best practical information—especially that branch adapted to the raising of silk worms. I had not only a large establishment of my own, but superintended those of several other persons with success—and have also acquired a practical knowledge of manufacturing silk. In 1820, I memorialized the honorable Congress upon this subject, but a press of other business prevented a timely attention to it. If a simple description, or treatise, on the silk-worm, would in any way benefit the country, I should, before this time, have taken up the subject; but this has already been done in Europe, by several eminent writers.

I have understood that the Legislature of Delaware have passed an act for the encouragement of the growth of silk-worms, and the manufacture of silk, and that some enterprising citizens of this State desire to turn their attention to the subject; this has induced me to submit my views to the public. The proper mode for carrying this object into effect, would be to form an agriculture in practice, on an eligible spot in this State. Or I would suggest some practical plan which would meet with general approbation. I could attend in many other States in the Union at the same time, which would be more likely to promote the success of the undertaking.

Any communication upon the subject, directed to me, by letter, post paid, and left with the editor of the Delaware Advertiser, Wilmington, shall be promptly attended to. A personal interview would be more desirable.

AGRICOLA.

Medicines prepared in distilled spirits—Dr Rush in his Observations on the Duties of a Physician, has the following remarks: "Give as few medicines as possible in tinctures made with distilled spirits. Perhaps there are few cases in which it is safe to exhibit medicines prepared in spirits, in any other form than in drops. Many people have been innocently seduced into a love of strong drink, from taking large or frequent doses of biters, infused in spirits."

New Bee Hive.—A box to be made of inch plank, say two feet three inches by twelve inches in width. The upper part of the box is to be divided off, allowing a space just sufficient to admit a drawer, say about 8 by 10 inches in front. The drawer is to slide upon a partition made to fit the inside of the box exactly, and through the middle of this partition, a hole is to be made, and a corresponding one in the bottom of the drawer, (about one and a fourth inch diameter) so as to allow the bees to pass from the lower part of the box into the drawer, a pane of glass is to be fitted in the outer side of the drawer, say 8 by 10, a sliding shutter is to be made so as to secure the glass and exclude the light. When the honey is wanted for use, first ascertain through the pane of glass, that the drawer is filled, then introduce a little smoke into the top of the drawer, in the usual

way, by means of a common tobacco pipe; and when the bees have all descended into the lower part of the hive separate the bottom of the drawer and the partition with a case knife, remove the drawer, and empty the honey, and return the drawer to its place, when the bees will commence working. On this plan the honey will always be obtained pure, without bee bread, or dead bees, and not a single bee will be destroyed.—*Mass. Spy.*

Tall Meadow Oats Grass.—It seems that the tall meadow oats grass, (*Avena clavata*) lately introduced on the recommendation of our correspondent, Justin Ely, Esq. has been long known in England, and is a natural grass there.

In the Bath papers for the year 1799, it is thus described: "*Avena clavata*, or tall oats grass—this grass is very luxuriant, it is rather coarse, but makes tolerable good hay. It is common in all meadows."

In Willich's Domestic Encyclopedia, it is thus described: "The *avena clavata*, tall oats grass, or oat, thrives on wet damp soils, in meadows, pastures, and hollow ways. It flowers in June and July. This grass vegetates with great luxuriance, and though somewhat coarse, makes tolerable good hay. It is eaten by cows, goats, and sheep, but is frequently troublesome in arable land, as its roots spread like couch grass, and are very difficult to be eradicated."

In a note to Davy's Agricultural Chemistry it is thus noticed: "*Avena clavata*, or tall oats grass; this is a very productive grass, frequent in meadows and pastures, but is disliked by cattle, particularly by horses. This perfectly agrees with the small portion of nutritive matter which it affords. It thrives best on stiff clayey soils."

On analysis it appeared to yield less nutritive matter from the same weight than most other grasses, but its whole weight per acre is much greater than almost any other.

We are induced to publish the foregoing, lest it should be supposed that we meant to recommend its adoption generally.

From what we have seen of it, we think it will never take the place of the meadow fox tail and some other grasses, though it may prevail against timothy or herds-grass. It will have two advantages over the latter, it is a very early grass, and produces a great after-crop.

It is however a coarse grass, and it would seem, is not very nutritive. The gentlemen farmers may rely that this new grass, called the tall oats grass, is the same as those above described by British authors. It has been accurately compared by botanists here, and it is certainly the same.—*Mass. Agri. Journal.*

BUTTER.

The dairy house should be kept neat, should never front the south, southeast or southwest. It should be situated near a good spring or current of water. The proper receptacles for milk are earthen pans not lined or glazed with lead, or wooden trays. In warm weather milk should remain in the pail till nearly cool before it is strained, but in frosty weather it should be strained immediately, and a small quantity of boiling water may be mixed with it, which will cause it to produce cream in great abundance, and the more so if the pans or vats have a large surface.

In hot weather the cream should be skimmed from the milk at or before sunrise, before the dairy gets warm, nor should the milk, in hot weather,

er stand in its receptacles longer than twenty-four hours. In winter, milk may remain unskimmed thirty six or forty eight hours. The cream should be deposited in a deep pan, kept during summer in a cool place, where a free air is admitted. Unless churning is performed every other day the cream should be shifted daily into clean pans, but churning should be performed at least twice a week, in hot weather; and this should be done in the morning before sun rise, taking care to fix the churn where there is a good draught of air. If a pump churn is used it may be plunged a foot deep in cold water, and remain in that situation during the whole time of churning, which will much harden the butter. A strong rancid flavour will be given to butter if we churn so near the fire as to heat the wood in the winter season.

After the butter is churned it should immediately be washed in many different waters, till it is perfectly cleansed from the milk; and it should be worked by two pieces of wood, for a warm hand will soften it, and make it appear greasy.

Butter will require and endure more working in winter than in summer.

Those who use a pump churn must keep a regular stroke: nor should they permit any person to assist them unless they keep nearly the same stroke; for if they churn more slowly, the butter will in the winter go back, as it is called; and if the stroke be more quick, it will cause a fermentation, by which means the butter will acquire a very disagreeable flavour.

Cows should never be suffered to drink improper water; stagnated pools, water whereon frogs spawn, common sewers, and ponds that receive the drainings of stables are improper.

The operation of churning may be very much shortened by mixing a little diluted vinegar with the cream in the churn. The butter being afterwards well washed in two or three changes of water. The whole of the acid will be carried off; or if any remain it will not be perceived by the taste. A table-spoonful or two of the vinegar to a gallon of cream.

Breeding at the nose.—Spirits of Turpentine applied to the nose and snuffed up has been found an effectual remedy for this complaint.

CULTURE OF THE VINE.

A friend, who is not only an amateur, but a connoisseur in horticulture observes that the following directions relative to the culture of the grape are novel, or at least not generally known, or dwelt upon by writers. If correct they are important, if not so, it is important that their fallacy should be detected. They are extracted from *Loubet's Vine Dresser's Guide*.

"A Vine-yard must be ploughed over often, and be kept entirely free from grass and weeds. This operation the French call *binage*. The first year, the ground requires to be ploughed over at least four times, and the grass kept completely under. The second year the first ploughing ought to be made towards the end of March, and as close to the stalk as possible, without hurting the roots. Then with the spade or hoe, you strip the stalk bare of earth (what the French call *dechaussege*), to the depth of about six inches, and you extract or cut off carefully all the shoots or sprigs, which you find even with the ground; also the superfluous roots of the plant. You leave the stalk, thus stripped of earth, exposed to the air for ten or fifteen

days, taking into view that the more the sun is hot, the less time is requisite. After this you use the plough in order to raise up the earth again to the plant, and with the spade or hoe, you give it a finishing. Another ploughing must be made from the 15th to the 20th May; another again towards the end of June, and a last one when the fruit is about ripening; that is, when it begins to alter its colour.

The third year, the ploughing must be made deeper, and the tearing or stripping of the stalks, nine inches deep, so as to be able to cut all the shoots that are found under ground at that depth, and also to cut close the roots which may have grown up to the surface. The three other ploughings for that year, are made at the same periods as recommended for the second year. The like operation is to be performed on every succeeding year; bearing, however, in mind that the older the plant gets, the more you must be careful in stripping the earth off your stumps to a proper depth, in order to clean them from their exuberant roots.

In very dry soils, observe not to plough too deep, but just sufficiently so as to destroy the grass and preserve to the ground, its moisture.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 9, 1856.

GARDENING, DOUBLE CROPS, &c.

In sowing broad-cast crops it is found of advantage to sow several sorts of seeds together, because some of them may fail or be destroyed by insects after they come up; if all come up and thrive, then such sorts as are least valuable may be treated as weeds. Thus onions, radishes, lettuces, and carrots are often sown together; sometimes the carrots are weeded out, and the best crop is the onions; at other times the onions partially fail, and are drawn for salading or transplanting, and the lettuce is the main crop. Radishes are often sown with turnips, as a sacrifice to the fly, while the turnips escape.

In general all transplanted crops, and as many sown ones as possible, are drilled; and for bulky crops, as cabbages, peas, beans, &c. it is an approved practice to sow or plant two rows near to each other, and then a wide interval, in which a dwarf early crop, or crops of short duration, as spinach, lettuce, &c. is sown. By the time the main crop is at its full size, the inter-crop is removed; the ground is then dry and another crop, as cabbages, or turnips introduced, which is ready in its turn to succeed as the main crop. In this way, no part of a market garden is ever left naked or cropless, at least during summer, and though these intervening crops are often injured when young by the shade of the main crops, yet, if the ground be in high order they soon recover when freely exposed to the air and the ground is stirred. If the land, however, is not in good heart, it is a better system to adopt a rotation, and stir the whole ground well between each crop, because here, the soil being poorer, a greater volume is required to supply the same nourishment; quantity is substituted for quality.

With respect to the comparative market value of crops, they must on the general average, be nearly on a par; if one crop is at any time dearer than another, it is in consequence of being more precarious or expensive to raise; if one article is

very dear at one time, it is immediately overgrown, and becomes proportionably cheap. To grow something of every thing is safe for those who have extensive concerns; select things for those who devote their whole attention to small spots; and things long of coming to perfection, as tart-rhubarb, sea kale, asparagus, &c. to those who have capital. It is never advisable to propagate a dear article very extensively, as every body is likely to do the same thing; it is better even to adopt a contrary practice.

A good deal of the profit of market-gardening depends on studying the state of the market; in gathering crops sparingly when things are low, and in sending liberal supplies at times, when from weather or other causes, they are, or are likely to be high. This requires both judgment and capital, for the needy grower must sell at any price.

GRAZING, HOVEN CATTLE.

In order to conduct the business of grazing with profit, a variety of circumstances require attention. In the first place care should be taken not to turn neat stock into pastures before there is a full bite, or the grass has obtained a sufficient degree of length and maturity. Neat cattle whose tongues chiefly enable them to collect their food, cannot bite close. Sheep and horses will thrive on short feed, where cows and oxen would scarcely subsist. Therefore, milch cows, working oxen and fatting beasts should have the first feeding of a pasture. Then you may turn in sheep or horses, or both.

When beasts are turned into fields, consisting either of clover entirely, or of a mixture of clover with other grasses, they are liable to be hoven or swollen. The common remedy for this disorder has been to stab the diseased animal with a pen-knife or other sharp instrument, under the short ribs, and put into the orifice a tube of ivory, elder, a quill, or something of the kind, to give vent to the confined air. This, however, is a rough and dangerous remedy, and it may be well to mention others more safe and gentle.

The 33d volume of Young's Annals of Agriculture, announces the following recipe for hoven cattle, which the work declares will effect a remedy in the most desperate cases in half an hour. Take three quarters of a pint of olive oil; one pint of melted butter, or hog's lard; give this mixture by means of a horn or bottle, and if it does not produce a favorable change in a quarter of an hour, repeat the same quantity and walk the animal gently about. For sheep attacked with this malady, the dose is from a wine glass and an half to two glasses.

Besides these remedies, flexible tubes, and canes with knobs at their ends, have been used to force a passage from the mouth to the stomach, to permit the confined air to escape upwards from the trunk of the animal affected. Descriptions of these instruments may be seen in the second edition of the Domestic Encyclopedia, vol. i. p. 409, 410. The following remedy we have been told is effectual, but have no personal knowledge of its application. Make about a pint of lie, either with hot embers thrown into a sufficient quantity of water, or by dissolving therein about an ounce of pot or pearl ash, and torn it down the throat of the ox or cow affected. A proportionably less quantity will answer for a sheep. This is said to give immediate relief by neutralizing the carbon-

acid gas in the stomach of the animal, which causes the swelling and other symptoms of the complaint to subside.

INDIAN CORN, INSECTS.

Soaking seed corn in a solution of Glauber's salts has been recommended as a preservative against insects and birds, and likewise the mixture is thought to have a stimulating and fertilizing effect, which forwards the growth of the young plants. (See N. E. Farmer, vol. v. p. 316.) The proper strength of the solution has not, as far as we can learn, been ascertained by experiment.

The farmers of Rensselaer county, N. Y. say that ashes or quicklime ought always to be applied to the top of corn hills immediately after planting, if it follow sward-land to prevent grub larvae from destroying the crop. The same application will have a similar effect if applied to the top of potato-hills. But neither unleached ashes, nor lime in its caustic state should be so placed as to come in contact either with the seed corn or the young plants. A strong solution of coppers in water will also preserve seed corn from insects and birds. The ashes or quicklime, however, are probably, more useful as manures.

SOILING.

This is a term, which is applied to the practice of cutting herbage crops green for feeding or fattening live stock. On all farms, under correct management, a part of this crop is cut green, for working horses and oxen. Animals employed in labour are much more serviceable when fed near at hand than when suffered to ramble over extensive pastures; in which case they are generally most out of the way when most wanted. Besides, if they are obliged to gather their subsistence over an extensive surface, by a fatiguing and protracted process, they will have less strength to spare while in the yoke, harness, &c. than if their food were obtained without exertion. But young animals require exercise in the open air, and, probably will not be found to thrive so well in houses or fold yards, during summer as in pastures; and though it is supposed that there is a great saving of food by soiling, the long, woody, and comparatively naked stems of the plants, with leaves always more or less withered, are, perhaps, not so valuable in the production of beef, as a much smaller weight of herbage taken in by pasturage. Besides many thousands of acres in the United States are valuable for pasturage, which are too rough and rocky for tillage.

Mr Bartholomew Rudd, an English agriculturist of eminence, in a letter to John Hare Powell, Esq. published in "Hints for American Husbandmen," says "You read much in our English publications of the excellency of soiling cattle in the house during the whole of the year. I do not approve of this practice, for it is surely an unnatural one, as air and exercise, and the selection of their own food, must benefit cattle, as other animals are benefited by them. I can say from actual experience of the two systems, that cattle thrive much better in the fields during the period from the middle of May to the middle of November, than they do when confined in a house. Soiling cattle is very little practised in England."

A company of gentlemen from Baltimore have commenced preparations for supplying our city with gas. They propose to lay as much as four miles of pipe the present season.

Gold and Silver Fish.

For sale at a pond in this vicinity a fine collection of Gold and Silver Fish. Any orders left with Mr Russell at the New England Farmer Seed Store, will be executed at a low price.

For Sale

At the Agricultural Warehouse, 52 North Market street, a variety of Millnet Boxes, for screening vines and plants from bugs and other insects. m 2

Patent Lamp Boilers.

These useful implements, invented, and patented by the Editor of the New England Farmer, are such a most economical and convenient method of boiling water in small quantities, for tea, coffee, cooking eggs, oysters, &c. &c. They are likewise very convenient for Druggists, in making decoctions, spreading plasters, &c.; and have been purchased and recommended in writing, by nearly all the Apothecaries in Boston. They are very useful in a sick chamber, being possessed of all the advantages of the common nurse-lamp, and applicable to many purposes, for which the nurse-lamp is inadequate.

Description of the above Cut.

[a] Sheet-iron case, in which the tea kettle, boiler, &c. may be placed, removable at pleasure. It has a hole in the bottom to admit the heat of the lamp to pervade the bottom and sides of the boiler. [b] Lamp, with five or six wicks more or less, placed, when in use, under said case. [c] Pan or boiler, which, when in use is placed in the sheet-iron case. [d] Tea kettle, in its place for boiling. [e] A small sheet-iron cylinder, a little tapering, so as to form a trestle of a hollow cone. This is occasionally placed within the case, in order to set upon it a flask, in porringer, or other small vessel, in which it may be wished to heat water.

Apparatus of the above description, may be obtained at the New England Farmer office, 52 North Market street—Adams & Fessenden, 80 State street—Joseph Kidder, corner of Hanover and Court streets—Ebenzer Wight, Milk street, opposite Federal street—R. A. Newell, Sommer street—Wm. Howe, 7 Marshall's Lane, Boston, and Benjamin Haynes, Charlestown. Prices of the whole apparatus, \$23.50. Case and Tea-kettle omitting the Pan, \$21.75. Case and Pan, omitting the Tea-kettle, \$1.75. A liberal allowance made to those who buy to sell again. m 9

Bellfounder.

The Norfolk trotter, imported July 1822, from England, to stand this season, 1823, at \$20, and \$1 the groom—the money to be paid to the groom. This celebrated Horse is a bright bay, with black legs, standing 15 hands high. His superior blood, symmetry, and action, excel every other trotting stallion. He is allowed by the best judges in Norfolk, to be the fastest and best bred Horse ever sent out of that county. He has proved himself a sure foal-getter—and his stock for size and substance are not to be surpassed. They are selling at the highest prices of any Horses in Norfolk. Bellfounder was got by that well known fast and high formed trotter, Old Bellfounder, out of Velocity—which trotted on the Norwich Road in 1805 sixteen miles in one hour—and though she broke 15 times into a gallop, and as often cantered. In 1836 she trotted 43 miles in one hour and forty seven minutes—and has also done many other great performances against time. Bellfounder at five years old trotted two miles in six minutes—and in the following year was matched for 300 guineas to trot 9 miles in 30 minutes, which he won easily by 22 seconds. His owner shortly after declined to perform with him 17 1/2 miles in one hour, but was not accepted. He has since never been saddled or matched. Old Bellfounder was a true descendant from the original blood of the Fire-aways, which breed of Horses stands unrivalled, either in this or any other country. Bellfounder is strongly recommended to the public, by the subscriber as combining more useful properties than any other Horse in America; and will stand during the season, at his stable in Charlestown, where all inquiries, (post-paid) will be attended to.

May 2 SAMUEL JAQUES, Jr.

Bull, Young Cow, &c.

This noble animal, (of the new improved Durham short horned stock) is from *Abelton* and *Amalfo*, presented to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Collins, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in his native State. He will remain at the farm of E. H. Derby, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be used at \$3 for each Cow, payable in advance. The whole proceeds from this animal, (for present season) will be for the benefit of the Society. Cows sent from a distance will be taken care of, if desired, at a reasonable charge.

Wilmot's Superb Strawberry.

We are sorry to be obliged to state, that of the hundred roots of this fine plant sent us from Europe, but two have reached this country alive. It is of course, be impossible to execute any orders for them this spring.

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in papers of six and a quarter cents each; likewise done up in packages comprising 20 varieties, each sort being labelled, at \$1 per package.

Balbus Roots, &c.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Balbus Roots, suitable for spring planting. Consisting of black, purple, orange, violet, crimson, rose, pink, bronze, and white colored DOUBLE MEXICO-AMARILIS. Also, Ferraria Tigrida, or Mexican Tiger Flower—Amarillis, Porro-sassos, or Jerusalem Lily—Double Tobacco, and Rannunculus; paintings of which may be seen at this place. The above collection of Balbus is in fine order, and is from the same House from which we obtained the Balbus Roots last autumn, which gave such unexampled satisfaction.

Just received, a small variety of Trans-planting Trowels for Gardeners, made to order, in Edinburgh, of polished cast steel, in the finest style, of different sizes—price, 75 cts. to \$1.50 each.

Also, a further supply of Lucerne and Potato Oats. A little of the Seed of the genuine Chou de Milan, or Milan Cabbage—the finest winter cabbage.

A further supply of the celebrated New Zealand Spinaech, Seeds of the Cuba Tobacco, (*Bolita ubero*) Yellow Fiancho, Texel, Spring Wheat, Spring Rye, Barley, Rape, Broom-Corn, Spring Vetches, Castor Oil Bean, Corn (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Burnet, Orchard Grass, Rye Grass, Tall meadow Oats Grass, White and Red Clover, Mangel Wurtzel, &c.

Also, Seeds for Diers use—Ornamental Flower Seeds, &c. comprising the largest collection of Seeds to be found in New England.

MISCELLANIES.

BY BISHOP HIBBER.

Lo, the lilies of the field,
How their leaves instruction yield!
Ha! to nature's lilies on given
By the blessed birds of heaven;
Every lily and tufted tree
Wardles sweet philosophy.
Mortal, fly from doubt and sorrow—
God provideth for the morrow!

Say, with richer crimson glows
The kingly anemone than the rose?
Say, have kings more wholesome fare
Than ye poor citizens of air?
Barn, nor hoarded grain have we,
Yet we canld merry.
Mortal, fly from doubt and sorrow—
God provideth for the morrow!

One there lives, whose guardian eye
Guides our humble destiny;
One there lives, who, Lord of all,
Keeps our fathes, lest they fall;
Pass we lightly, then, the time,
Fearless of the snare and line,
Free from doubt and faithless sorrow—
God provideth for the morrow!

The Tartar's Origin of Earthquakes.—Bell, who travelled among the L'ecremisch Tartars, says, that earthquakes there are attributed to the awkward attempts, which are made by the frog, who supports the globe, to scratch himself!!

The advantages of temperance.—A blacksmith in the city of Philadelphia, some forty years ago, was complaining to his iron merchant that such was the scarcity of money that he could not pay his rent. The merchant then asked him how much rum he used in his family in the course of a day. Upon his answering the question, the merchant made a calculation, and showed him that his rum amounted to more in the year than his house-rent. The calculation so astonished the mechanic that he determined from that day to buy and drink no more spirits of any kind. In the course of the next ensuing year he paid his rent, and bought a new suit of clothes out of the savings of his temperance. He persisted in it through the course of his life, and the consequence was competence and respectability.

The Hypochondriac.—The dyspeptic ought to run away from, or determine to combat, the first menace of discontented feeling. Low spirits may be successfully resisted if the attempt be commenced sufficiently early. "I will be good," says the child who sees the rod ready to direct the will into the way of goodness; and "I will be cheerful," ought the dull and dyspeptic to say, who observes above him a cloud of hypochondric fancies ready to burst upon his devoted head, if he chooses the path which leads to afflictive feeling. It is easier, I shall be told, to preach than to practice—to prescribe than pursue. But of this I am certain, that before the habit becomes confirmed, or yielding to their influence, a determined, and I would say, conscientious resolution of dispersing the coming mists of vaporous depression, may prove, to a very considerable extent, successful and effective. We would not be paradoxical or extravagant enough to assert, that for a person to be in health, it is sufficient that he wills it. But without transgres-

sing the moderation of truth, we may venture to give it as our opinion, that a man often indolently bends under the burden of indispotion, which a spirited effort would, in the first instance, have shaken from his shoulders. If, upon the approach of the malady, he had resolutely set his face against it, he would probably have arrested it in his threatened attack. The doctrine of irresistibility, in all its extent, is neither a true nor a wholesome doctrine; and the hypochondriac should reflect, that in saying to gloom, henceforth be thou my good! he not only directs his destiny, but implicates others in his fatal choice—

Call it madness, call it folly,

Call it whatso'er you may,

There's such a charm in melancholy,

I would not, if I could, be gay.

Melancholy has something in it of poetical and sentimental, which constitutes a great portion of its charms: but stripped of its ornamental accompaniments, and laid bare to a dissecting view, it will be found to consist, in a great measure, of pride, selfishness, and indolence. I cannot conceive a more delightful spectacle, than that of an individual whose constitutional cast is melancholic, warring against his temperament, and determining to enter with hilarity into the scenes and circumstances of social life. In this case we have all the interests of melancholy, without its objectional parts.—*Dr. Uvins on indigestion.*

Village Poultry.—We have often admired the policy of our villagers, who keep fowls to scratch up their gardens. Having a few precious feet of ground, not a particle of which should be misimproved, they lay out their beds and plant their seeds, and then let in the hens to mar their labors and destroy the hopes of the season. A single old hen, well practised in the use of beak and claws, will do more injury in a garden in one hour, than the eggs and chickens of a dozen can compensate in a year. But if they merely injured the property of their owners, (however questionable the policy of keeping poultry in a village might be) no other person would have just cause of complaint. But where gardens and tenements join each other, these marauders think it no hardship at all to scale the walls, and scratch up the seeds of their neighbors. And hence, besides the direct mischief they do to gardens, they set neighbors by the ears, and by their own clawing cause a clapperclawing among the bipeds of the superior order.

Would it not therefore be wise to enact a village law, that all the fowls should be banished to a distance of one mile, on pain of being decapitated and made into fricassee, if found within the interdicted lines—or otherwise that they shall have one wing clipped, be securely muzzled, and finally be provided with good and sufficient leather stockings, at the expense of their owners.—*Berkshire American.*

Harrowing in spring grain.—We would recommend the farmer to pass the harrow over his fields of small grain. It will have a fine effect in giving it an early start, and enabling it to out-grow most of its enemies. The reasoning is plain and obvious—it acts like a fresh ploughing of maize, just before a good rain—the surface of the ground is softened about the stalk—gives it room to expand, and numerous bugs and insects are routed, covered over, and destroyed.

New Vegetables.

Just received at the New England Farmer Seed Establishment, a small invoice of rare and choice vegetable seeds, from Europe, comprising Large Green Artichoke of Laon, (considered the finest sort known, but very rare, even in Europe)—Brighton Coss Lettuce—New Silver Giant Celery—Asparagus of Allemagne, a new and superior sort—Cremor Carrot from Holland fine for the table. For sale in packages of 12-1-2 cents each.

Cow for Sale

A superior Cow, three years old, having had two calves—of English breed, and has given a quart of milk per day, without any extra feeding, is offered for sale, at \$75. She is sold for no fault—it being inconvenient for the present owner to pasture her. Inquire of James Holden, near the Punch Bowl in Brooklyn. May 2

Notice.

The owner of the Horse-Columbus, recently owned by the Massachusetts Agricultural Society, by sending his address to the publisher of the New England Farmer, will hear of something to his advantage. N. B.—Any person knowing the address of the owner will confer a favor by informing the editor as above. New York, April 23th 1828. 21 m. 2

Landreth's Nurseries.—New Philadelphia.

From the patronage already extended to the Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquisitions of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Pallous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe with all the best-cultivated varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing none but those most worthy of cultivation. Persons not acquainted with the different Varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons, parlours, dining rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Esculent Vegetables for seedling. The method pursued by the Proprietors in this branch, certainly most obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of these kinds, liable to mix in seedling—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance undoubtedly conspires in an eminent degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Parker & Colman, No. 31 Congress St., Boston, of whom printed catalogues of the whole, may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

D. & C. LANDRETH

New Agricultural Works

Just published, and for sale at the office of the New England Farmer, is a Treatise on the Cultivation of Ornamental Flowers; comprising Remarks on the requisite Soil, Sowing, Transplanting, and general Management; with Directions for the general treatment of Bulbous Flower Roots, Green-house Plants, &c. By Roland Green. Price 37 cts.

Likewise, just received from New York, "Economy of the Kitchen-garden, the Orchard, and Vinery; with plain practical Directions for management. By William Wilson, Nurseryman. Price 75 cts."

Also, "Observations on the Efficacy of White Mustard Seed, (*Sinapis alba*) taken whole. From the 10th London edition, revised and improved." Price 6 cts.

Also, "Seventy-five Receipts for Pastry, Cakes, and Sweetmeats. By a Lady of Philadelphia." Price 50 cts.

For Sale.

A superior Draught Horse, particularly calculated for a farm horse. Apply at this office, or of Wm. Burrows, near Jamaica Plain, Roxbury. April 25

Gunpowder, &c.

Du Pont's Gun Powder, at 25 to 30 cts. per pound—Shot—Balls—Flints and Percussion Caps

Also, Alum—Refined Sulphur—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street. By E. COPELAND, Jr.

[?] The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. if March 14

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

BEES.

MR. FESSENDEN.—A neighbor of mine informs me that he has succeeded in preserving, (the last winter) a very small and late swarm of bees, by burying them on a dry knoll in the same manner potatoes are buried. After placing them in the hole he put boards over them, leaving the space about the sides of the hive vacant. He says the quantity of comb formed last season in the hive was not bigger, if as large as his hat. After taking them out this spring he fed them only twice. They are now lively and promise to do well. H. *Cornish, N. H. May, 1828.*

FOR THE NEW ENGLAND FARMER.

DANDELIONS.

MR. FESSENDEN.—Last year in May, I set out two rows of dandelions, which were taken up when in bloom, not being able to attend to it before. They were placed a foot apart, and the rows two feet asunder, and about one hundred feet in length. The leaves all perished, but having hoed the earth upon the roots, others sprang up in a few days, and continued to grow, luxuriantly, until autumn, and covered all the space between the plants. Just before the ground froze straw was spread over them. In February they were opened and my table has been supplied with an abundance of greens and salad since. They have been cut four times, and some of them five. The rapidity with which the leaves shoot out after cutting, is greater than in any plant I have ever seen. Some of them were covered with flower pots, after the fourth cutting, to blanch the leaves for salad, and they are nearly or quite equal to endive. In five days after the pots were put over, the leaves which had previously been cut close to the crown of the root, shot up five inches in height.

I kept the ground, which is very rich, hoed and raked between the plants, during the last season and the present.

Thus, at little trouble and expense, can a family be supplied with greens and salad, from February until sea-kale and asparagus come in.

They may be set out, at any time after the frost is out of the ground; but the present answers perfectly well. I would recommend that the rows be three feet asunder, and the plants two feet apart in the rows; for I find mine are too crowded, as each plant, last autumn, covered an area of from fifteen to seventeen inches in diameter.

Care must be taken not to cut the leaves so close as to injure the flower buds.

Very respectfully,

Your most ob't. servant,

H. A. S. DEARBORN.

Brintley-place, May 7, 1828.

FOR THE NEW ENGLAND FARMER.

CATERPILLARS.

There are many ways proposed for destroying this insect, which so much disfigures and injures our orchards. Destroyed, they must be, by every

orchardist, who has any regard even to appearance. In large trees, it is difficult to reach them. I have for many years practised the following method with much satisfaction to myself: I select a narrow strip of board, or pole of sufficient length to reach the top branches of my trees, and near one end make a hole with a tap-borer. In this hole I insert a painter's brush. I then prepare, in a small vessel come thick soap suds, (any dirty soap will answer for this use) and with the brush while the worms are in their nests apply the suds. This application will instantly kill every caterpillar, whether small or large, that is wet with it. I esteem the suds useful to the tree, and have often applied it to the bodies of such trees as appear bark-bound or otherwise unhealthy.

POTATOS.

Some years since, I obtained in Norwich, (Conn.) a variety of this vegetable, which, for the table, is superior to any other I have seen. The external appearance is to an inattentive observer, much like that of the English whites. The shape is somewhat different, being longer; and they are generally, if not invariably, marked with one or more red spots or red eyes. When cut open, they are easily distinguished, being almost white;—while the English whites are yellow. These potatoes were called at Norwich the *Rogers' potato*; that being the name of the person (in the adjoining town) who cultivated and brought them to that market. I presume this variety is known to many of your subscribers; and it may be, that the history of it can be traced. I, for one, should be gratified if you or any of your correspondents would furnish a short account of this variety. It might lead to the discovery of other varieties of this truly useful plant.

I ought, perhaps, to add that this variety yields well on good ground, and is of a medium size; and when boiled or baked, is dry and farinaceous, and retains its goodness in a remarkable manner till late in the ensuing summer. Having a good variety of an early potato, I have not ascertained whether this is or is not early. H.

Remarks. The potatoes mentioned above, came duly to hand; are planted, and if their produce is found to possess valuable properties, it will be distributed in that way which may appear most likely to promote its general diffusion.—*Editor.*

Abstracted from foreign Journals for the N. E. Farmer.

CULTURE OF CELERY.

MR. KNIGHT from experience, recommends planting celery at greater distances than is usually done, and covering the beds into which the young seedlings are first removed with half rotten dung, or spread to the depth of two inches with mould, and to keep them very moist. MR. WEDGWOOD finds that seedling plants do best to remain in the beds till of considerable size.

CAMELIAS IN THE OPEN GROUND.

MR. HARRISON finds that the double red, white, and striped camellias will bear an English winter if planted out when about two feet high, having been previously stunted in their growth by repeat-

edly stopping their leading shoots. For two winters they require protection.

DAHLIAS.

At the meeting of the London Horticultural Society, September 18th, no fewer than *eight hundred and fifty-one* varieties of dahlias were exhibited.

HORSE RADISH.

In Denmark, the horse radish is cultivated by cutting the roots into slips and planting horizontally, the lower end inclining a little upwards, and the crown of the plant hanging over the alleys, by which the buds are separated. From time to time the roots are uncovered and all the lateral fibres are carefully removed by which the size and length of the roots are much increased.

CHRYSANTHEMUM.

This plant is now cultivated to a great extent in England, and fifty-two varieties adorn the gardens in November.

MELONS.

A second crop of melons may easily be had in three weeks by cuttings from the ends of bearing shoots. They are to be struck in pots.

SALT.

The London Quarterly Journal of Science contains a valuable paper on the use of salt as manure. It has been found to answer the most sanguine expectations for barley, oats, potatoes, and turnips. Mr. Johnson has given the result of several trials of it in a kitchen garden, which are as follows:

Windsor Beans. Soil without any manure produced 135½ bushels per acre. Soil dressed with 20 bushels of salt per acre a week before sowing, produced 217 bushels per acre.

Onions. Soil manured with 20 bushels of salt and 10 tons farm-
ton. cut. q. lbs.
yard manure. 3 12 3 12

Soil with 12 tons yard manure, 2 10 2 19
Early potatoes. Soil without any manure, produced 208 bushels. Soil with 20 bushels of salt, produced 584 bushels.

MR. HOGG finds salt to increase the beauty and size of the flowers of all bulbous plants and carnations.

FOR THE NEW ENGLAND FARMER.

AGRICULTURAL AND GEOLOGICAL SURVEYS.

To the President and other Officers and members of the Massachusetts Society for promoting Agriculture—

GENTLEMEN,

The subject of this communication is my only apology for making it. It is agriculture; or the application of science for its improvement. It is an agricultural and geological survey of this Commonwealth, and other parts of New England.

The object of the survey is to unfold, and apply the various resources which a bountiful Providence has in rich abundance, placed at our feet; but which yet remain, in a great measure, hidden from our view. Resources which may be applied

to advance, not only the interests of agriculture, but those of manufactures and internal improvements, and of course the general and best interests of our country. It cannot be doubted, that there are many ore mines, coal beds, peat, marl, and clay pits—granite, slate, soap-stone, and marble quarries, yet unknown or not applied, with their greatest effect, to their legitimate uses—which proper researches and examinations may bring to view, and ingenuity and enterprise apply to increase the wealth and general prosperity of the country.

The importance of such researches and examinations, guided by the light of science, I know will not be questioned, by the gentlemen whom I take the liberty to address; but what is the most eligible method of effecting an object which all acknowledge to be important may be a subject of doubt. To present some definite measures, I hope I shall be pardoned for the liberty of suggesting for the consideration of the gentlemen of the Society, a plan which has appeared to me feasible and perhaps eligible, in the initiatory steps.

The course, which, with some reluctance, I ask permission to propose, is to take some measures to diffuse through the community, and particularly the younger part of it, a knowledge of the general principles of Geology, with their application to the business of the farmer, the manufacturer, and the civil engineer.

It is however, difficult, if not impossible, to give a knowledge of this science by books merely—specimens and explanations are important if not essential, for a knowledge of its first elements, and by the aid of these a knowledge of this science, is perhaps, more easily and readily obtained, than of any other which is taught.

Measures to present opportunities and inducements to various classes of the community, and among them teachers with a portion of their pupils, to hear explanations of the general principles of the science, and all specimens attended with appropriate descriptions, is the plan which I beg leave to submit.

Several advantages have suggested themselves, which might probably arise from the proposed course: and,

First, It would furnish to the rising generation a subject of instruction, calculated to enlarge their minds and extend their views—an agreeable and healthful exercise and amusement, in collecting and examining the productions of the mineral kingdom, which in various and rich profusion are scattered around them, and convert their recreations into sources of rich and lasting improvement.

Secondly, It would place the information arising from the examinations where it is wanted, viz. in the possession of the people, and probable to a greater extent than if they were made by an individual merely, though he should proceed strictly upon the principles of science, carefully note, and faithfully report, to the public the result of his researches and examinations.

Thirdly, It is believed that the proposed course though imperfect in its initiatory steps, would eventually be thorough and minute. If individual in various parts of the country can be induced and enabled to examine for themselves, and that too in their ordinary walks and journeys, the geology and agriculture of the country around them, they would have it in their power to develop more fully and minutely its natural resources,

than could be done by a single individual and a stranger, however well he might be qualified for the undertaking. They would at least be able to afford great facilities to some future researches, which might be more strictly scientific, and analytical, and be prepared to be interested and profited by them.

Fourthly, It may, perhaps, be the most feasible course. At present, though the science of geology has made more rapid advances within the last twenty years, than did ever any other science in the same period of time, there is still, in a great part of the community, almost total ignorance upon the subject, and if a considerable part of the community can be enlightened into its principles and uses, it can hardly be doubted, that they will take measures to avail themselves of the advantages which it offers.

I will here take the liberty to mention, that I have been taking measures for several months past, to collect specimens of the useful production in the mineral kingdom, and in such quantities as to be able to furnish sets to academies, schools, societies for improvement, or individuals, as they should wish to procure them. And that if any arrangements can be made between several towns in the same vicinity to furnish attendants, I will undertake to afford them what little aid is in my power to forward this subject of common interest, and favorable alike to the pecuniary, the intellectual, and the moral prosperity of the country.

The foregoing is submitted for the consideration of the officers and members of the Massachusetts Agricultural Society by their friend and the friend of science and arts.

To forward the introduction of this science as a branch of common education, all teachers engaged in schools, as the subject is offered to their attention, are invited to a gratuitous attendance.

JOSIAH HOLBROOK.

The foregoing plan and proposals having been laid before the Trustees of the Ms. Ag. Soc. and the visitors of the Professorship of Natural History, they referred the same to John Lowell, Dr. J. Jackson, and Benjamin Guild, Esqrs. The Committee having taken the same into consideration, are of opinion, that the instruction proposed to be given by Mr. Holbrook, would be of great public benefit. The subject is one of importance to the farmers, and manufacturers of this country, and the views which Mr. Holbrook entertains of the mode of instruction appear to the Committee rational and just. Of Mr. Holbrook's qualifications for such a task, he has produced highly respectable evidence: and the Committee, therefore, cheerfully recommend to the citizens of this State, the encouragement of this gentleman in his laudable efforts "to diffuse through the community, and especially the younger part of it, a knowledge of the general principles of Geology with its application to the business of the farmer, the manufacturer, and the civil engineer."

Per order of the Committee,

JOHN LOWELL, *Chairman.*

From the American Farmer.

SILK.

[Every fact upon this subject is interesting, and here are some new ones, showing the spontaneous growth of the worm and its food, and the uncommon size of their cocoons, in Mississippi.]

MR SKINNER—I have taken the liberty to enclose a specimen of the silk of this country, as it is found in the forest. The size of the cocoon struck me as being remarkable, though from what I can learn, not uncommon in this country.—When brought to me, it was about the size of a hen's egg, and different from all others that I have seen, by having a husk on the outside, in all respect similar to that which immediately enclosed the worm. Between the two husks the silk was extremely loose. It was brought to me by a negro who said it was found upon a black mulberry tree. The cocoons are found sometimes upon the linn and sometimes upon the cane. Upon the latter, they are generally small, but upon the linn they are mostly larger than upon the mulberry.

This part of the country abounds with the mulberry; mostly black and red, though there are a great many of the white. Probably four-fifths of the forest mulberry are barren, but from the shape of the leaf, are supposed to be of the black species.

I am anxious to obtain some information upon the culture of silk, as applicable to this country. It would give me pleasure, therefore, to hear from you upon the subject.

Respectfully yours,

W. H. BENTON.

PEACH TREES.

"Peach trees are liable to three casualties:

1. The fly, that deposits its egg near the root, and there forms a worm.
2. The bursting of the bark by severe frost in wet winters.
3. The splitting off the limbs at the fork of the tree.

The fly which is blue, (but not a wasp,) begins its attack about the middle of July, and continues its depredations until the middle of September.—It wounds the tender part of the bark, and generally at the surface of the ground, there depositing its eggs, which hatch into worms, and prey upon the mucilage and tender part of the bark; until the communication between the root and the branches is cut off, causing the death of the tree. To guard against this, raise a little hillock in the month of June, round the tree, about a foot high, so as completely to cover that part of the bark kept moist and tender at the surface of the ground. This hillock will not stand so long at one height, as to tender the bark above, as the rain will gradually wash it down level with the surface, and it must be raised again every summer."

To take out the worm, the roots must be uncovered, and the spot looked for where the gum oozes out: follow the cavity round with the point of a knife, until you come to the solid wood, and lay the whole open: the worm will be found with a white body and black head; which must be destroyed, and the holes carefully filled up with cow-manure rendered adhesive by sand or lime core and ashes, as directed by Forsyth.

Soap-suds heated after a family wash, and poured on the roots of the trees about the middle of August, has been used with success in destroying the eggs, or the young worm.

According to Mr John Ellis of New Jersey, the injury arising from the worm may be prevented in the following way:

In the spring, when the blossoms are out, clear away the dirt so as to expose the root of the tree, to the depth of three inches; surround the tree with straw about three feet long, applied length-

wise, so that it may have a covering, one inch thick, which extends to the bottom of the hole, the butt-ends of the straw resting upon the ground at the bottom; bind this straw round the tree with three bands, one near the top, one at the middle, and the third at the surface of the earth, then fill up the hole at the root, with earth, and press it closely round the straw. When the white frosts appear, the straw should be removed, and the tree remain uncovered until the blossoms put out in the spring.

By this process the fly is prevented from depositing its egg within three feet of the root, and although it may place the egg above that distance, the worm travels so slow that it cannot reach the ground before frost, and therefore is killed before it is able to injure the tree.

"The truth of the principle is proved by the following fact. I practised this method with a large number of peach trees, and they flourished remarkably, without any appearance of injury from the worm for several years, when I was induced to discontinue the straw with about twenty of them. *All those which are without the straw have declined, while the others which have had the straw, continue as vigorous as ever.*" Thus far Mr. E.

"To guard against frost, plant the trees where the water will run off, and procure the sweetest and richest fruit, as the inferior qualities are more injured by cold.

"The splitting of the tree at the forks, is guarded against by preserving as many upright branches as can be spared, by breaking off, in bearing years, more than half the quantity of fruit while small, and by pruning almost the whole of every branch beyond where the fruit is set, leaving only a few buds on each of the succeeding year's fruit. The size of the fruit is by these means rendered larger, more beautiful, and of a higher flavor, and the growth of the tree is rendered more vigorous."—*Domestic Encyclopedia.*

(To be continued.)

BUTTER.

The New York City Agricultural Society have offered the following premiums to be awarded by a committee of the board of managers, for the best specimens of BUTTER, which shall be exhibited at the Fulton and Washington Markets, at 8 o'clock of the morning of the 25th day of June next, viz.

At the <i>Fulton Market</i>	1st premium,	\$15
	2d do	10
	3d do	10
	4th do	5
At the <i>Washington Market</i>	1st premium,	\$15
	2d do	10
	3d do	10
	4th do	5

The regulations to be observed in awarding the premiums will be;

1. That candidates for the same, must be persons who usually supply any of the city markets with summer butter.

2. The article must be formed into rolls or prints, of not less than one, nor more than two pounds—the quantity offered by each exhibitor to be not less than 12 lbs.

3. Competitors in one market, are not to be candidates for premiums in the other.

4. The style and neatness of the exhibition of the article as well as its quality, will be taken into consideration by the Committee.

The former premiums given by the Society for the improvement of this article, have, it is believed, caused greater care generally to be taken in the management of dairies—multiplied ice houses among the farmers, and excited fair competition, as beneficial to them as it is salutary to our citizens. Per order.

J. ADRIANCE, Sec'y, pro tem.

From Cobbett's American Gardener.

TARRAGON.

This is a very hot, peppery herb. It is used in soup and salads. It is perennial, and may be propagated from seed, or from off-sets, or slips, put out in spring. Its young and tender tops only are used. It is eaten with beef-steaks in company with minced shallots. A man may live very well without it; but, an Englishman once told me, that he and six others once eat some beef-steaks with shallots and Tarragon, and that, "they voted unanimously, that beef-steaks never were so eaten!" It must be dried, like mint, for winter use.

FENNEL.

This is a perennial plant; propagated from seed, or from off-sets; and sown, or planted, either in spring or fall. The plants should stand about a foot asunder. It is a tall plant with hairy leaves. Its leaves are used in salads, are chopped up fine to put in melted butter eaten with fish, they are boiled with fish to give the fish a flavor, and, they are tied round mackerel, particularly, when these are broiled. The French, who excel in the cooking of fish, always do this. The leaves, thus broiled, become crisp; and, they are then of a very fine flavor. In winter, the seed, bruised, gives fish the same flavor as the leaves do in summer; and, to my taste, butter, seasoned with fennel, is better than any of the fish sauces, bought at the shops.—It is a very hardy plant. Two yards square will contain enough for any family; and, once in the ground, it will stand there for an age, or ten ages, as far as I know.

LAVENDER.

This is a beautiful little well-known shrub of uses equally well known. Hundreds of acres are cultivated in England for the flowers to be used in distillation. It may be propagated from seed; but is easiest propagated from slips, taken off in the spring, and planted in good moist ground in the shade. When planted out it should be in rows three feet apart, and two feet apart in the rows. If the flowers be to be preserved, the flower-stalks should be cut off before the blossoms begin to fade at all.

TOMATUM.

This plant comes from the countries bordering on the Mediterranean. In England it requires to be raised in artificial heat, and to be planted out against warm walls. Here it would require neither. It climbs up very high, and would require bushy sticks. It bears a sort of apple about as big as a black walnut with its green husk on. This its fruit is used to thicken stews and soups, and great quantities are sold in London. It is raised from seed only, being an annual; and the seed should be sown at a great distance, seeing that the plants occupy a good deal of room.

STRAIN.

Vulgarly called *sprain*, a violent extension, or stretching of the sinews, or tendons, by which the

fibres are sometimes broken. All sorts of animals and particularly horses, are liable to lameness by strains. My designed brevity will not permit me to treat fully on this subject. But let it be noted that when a horse is lamed by straining, he should be permitted to rest, and be secured from wet and cold. Rest alone will sometimes recover the tone of the fibres, and complete the cure. But bad strains should have some suitable applications to the parts affected. Oily medicines are in general to be avoided, on account of their relaxing quality. But oil of turpentine may be admitted. A part that is lamed by straining should be bathed thrice a day, with hot verjuice or vinegar, in which a small piece of soap may be dissolved.

Early in the disease, if the part be swelled, a poultice should be applied after bathing. It should be made of oat meal, rye meal, or bran, boiled in vinegar, strong beer, or red wine lees, with lard enough to prevent its growing stiff. After the swelling is down, bathe with camphorated spirits of wine, mixed with half as much oil of turpentine. Or, instead of the oil, take sharp vinegar, and spirits of vitriol, in equal quantities. Keep on a linen bandage, drawn pretty tight, if the part affected will admit of it. But long resting from labor, will in some cases be needful. For further directions, the reader may see Bartlett's Farriery.

Mason's Farrier prescribes the following remedies for strains. *First*, Take of sharp vinegar one pint, spirits of any kind half a pint, camphor one ounce; mix them well together, and bathe the part injured twice a day; a piece of flannel wet with the mixture, and wrapped around the part, will be very beneficial; take from the neck vein half a gallon of blood. *Second*, Take of opodeldoc a piece the size of a marble, and rub it on the strained part with the naked hand, until the hand becomes dry, twice a day; should the injured part resist both of those remedies, you may conclude the injury is a very serious one, which nothing but time can relieve, and the horse must be turned out upon grass a sufficient length of time for nature herself to perform the great operation.—*Deane*.

The correspondent of an English newspaper, recommends the keeping of blood hounds, to facilitate the detection of sheep-stealers, murderers, and other depredators. As a proof of the sagacity of these animals, he relates the following instance:

"About eighteen years ago, a Mr. Peaton, near Lympington, Hants, had a sheep shot about one o'clock in the morning, as the report of the gun was heard about that time; and in the morning the sheep's paunch was found. A person was sent for the hound to Mr. Edward Toomer, keeper of the New Forest, and before the hound could be brought to the spot it was about two o'clock in the afternoon, a space of time of thirteen hours. He was laid on, and he followed the scent, a very crooked road, to the door of the culprit; the premises were searched in vain for some time, but the hound could not be prevailed on to quit. He at last went into the fuel house, and then began scratching. On removing the fuel a large stone was found, which the hound scratched, on removing which, the mutton was discovered. A search warrant was obtained, the man taken before a magistrate, and sent to Winchester, had his trial, and was transported."

WEEDING PASTURES AND MOWING LANDS.

[By the Editor.]

The weeding of pastures and mowing ground is of much importance, though we believe, not so attended to. Weeds in grass-lands injure the farmer by the ground they occupy, the seeds they disperse, and sometimes by injuring the quality of milk or the health of cattle. Small creeping weeds, cannot be removed from grass lands on a large scale without causing too much expense.—But large plants, such as dock, fern, thistle, &c. should be extirpated. "The weeds that appear in grass-lands in this country, may be divided into upland weeds and aquatics, some few of which are annuals, but a greater number, especially of those that are most noticed are perennials.

"Of the upland weeds those which have proved to be the most troublesome are the upright crow-foot, Ranunculus, commonly known by the name yellow weed; ragweed, ragwort, or Roman wormwood, Senecio; the greater daisy, ox eye, or white weed; Chrysanthemum; yarrow, dandelion, dock, thistles, sorrel and John's wort.

"Some of these, particularly the two last, and the daisy and ragweed, are conquered by a plentiful manuring of the ground; for where the land is rich they are not found to flourish. Pasturing the land with sheep is said to be fatal to the daisy and the crowfoot.

"But the most effectual way to destroy these weeds, is to break up the land, and employ it in tillage.

"When it is not found convenient to take this method, the weeds may either be dug out or else pulled up by hand, which, when the ground is moistened by rain may be easily done. It is to be remembered that this should be done at or before mid-summer, that none of their ripened seeds, or any that may possibly vegetate, may be scattered on the ground.

"The aquatic weeds, such as flags, rushes and the like, are not easily subdued by any of the above methods, some of which have often been tried in vain. Draining the land, which deprives them of that degree of wetness which is suitable to their nature, is an infallible method, and, perhaps, the only effectual one of destroying them.—But liming the ground at the same time, renders the operation more sudden and effectual. Or, if lime cannot be had, ashes and soot are good substitutes."

We notice almost every day, packages of fruit trees, from the nursery of Dr. Fiske, on their way to other towns. It is gratifying to find so much attention bestowed not only on the culture of fruit, but on the choice of good trees. The nursery of Dr. Fiske has been cultivated with great care, and affords a sufficient choice to almost every one who is desirous of trees. We regard it as of great public utility, and hope the care and labor of its proprietor will be well compensated.

When the late Dr. Dwight, the distinguished President of Yale College, first removed to New Haven, he immediately began to stock his garden with fruit-trees. His neighbors admonished him of what they thought the folly of his undertaking, saying that if he cultivated fruit he need not expect to enjoy it in such a town as New Haven, for it would be all plundered. He replied that there were two courses, either of which might be adopted—one, to have all their gardens entirely destitute of fruit; the other, to make it so plenty, by

its general cultivation, as that the depredations on the garden of any individual would be so light as not to be seriously felt. He thought the latter course the preferable one; and therefore, he said, he should pursue his plan, with the hope that his example would be generally followed. It was generally followed, and the consequence was such as he predicted.—If this policy were generally adopted its good effects would soon be apparent.—It has been adopted to some extent in this town; and we trust it will be, to a still greater. The facilities for obtaining good trees are now so great that it is in the power of every man who owns a garden, easily to provide himself with choice fruit.—*Worcester Yeoman.*

Destroy Thistles.—Much has been said and written on the subject of destroying the Canada thistle; and it has been proposed that bounties for their extermination should be granted by Legislatures. The following we have known put in practice with complete success. Let them alone till they are in full bloom, and then cut them with a scythe. If they are cut when young, they produce fresh shoots, but if mown just before the seed is formed, the stem contains a hollow by which the dews and rain water descend into the heart of the plant and it soon dies. If, however, you cannot find leisure to mow them till the seed is formed, you may even then cut them down, and as soon as they have dried a little in the sun, rake them into heaps and burn them. It is possible that a few may spring up the next season, but two or three cuttings will be sure to destroy them.

PLACES OF SAFETY IN TIMES OF THUNDER AND LIGHTNING.

[By the Editor.]

Dr Franklin's advice was to sit in the middle of a room, provided it was not under a metal lustre suspended by a chain, sitting on one chair and laying the feet on another. It is still better, he observed, to bring two or three mattresses or beds into the room and folding them double, to place the chairs upon them; for as they are not so good conductors as the walls the lightning will not be so likely to pass through them. But the safest place of all is in a hammock hung by silken cords, at an equal distance from all the sides of the room. Dr Priestly observed that the place of the most perfect safety must be the cellar, and especially the middle of it: for when a person is lower than the surface of the earth, the lightning must strike it before it can possibly reach him. In the fields, the place of safety is within a few yards of a tree, but not quite near it. Beccaria cautions persons not always to trust too much to the neighborhood of a higher and better conductor than their own bodies, since he has repeatedly found that the lightning by no means descends in one individual track, but that bodies of various kinds conduct their share of it at the same time, in proportion to their quantity, and conducting power.

During the rising or continuance of a thunder storm, avoid touching the conductors of any building, or being very near them, especially at an open window. Shun all trees where sithes, and other metallic implements of husbandry are hung up.

Treatment of persons struck with lightning.

Resuscitatives.—"Sprinkle the face with cold water; or expose the subject, if robust, to the influence of the shower bath; apply cloths dipped

in vinegar to the pit of the stomach; and gentle friction which should be resorted to, alternately, with the sprinkling of cold water, from the beginning of the process, at first with great caution, over the lower extremities, and gradually extending it upwards to the left side of the body.

"In particular cases, where the means before stated prove ineffectual, it will be advisable to open a vein, or to electrify the patient, by directing the shocks through the breast, so that the fluid may pervade the heart. Meanwhile pure air may be blown into the lungs, (as directed in the treatment of drowned persons); and if anxiety appear to prevail, blisters should be applied to the chest.

"When signs of returning life become evident, the mode of treatment before pointed out must be continued for some time, though with great moderation. The cloths applied to the pit of the stomach, should now be dipped in wine, or warm vinegar; common poultices applied to the injured parts; and when the patient is able to swallow, a mixture of wine and water, or balm-tea may be sially administered."—*Domes. Ency.*

New Improvement.—We are informed that Mr. Jedediah Richards, of Elbridge, in this county has invented a machine for making window sashes, which operates almost wholly with circular saws. The stuff from which the sash is made, is not planed at all—it is wholly fitted with saws from the rough. Three sides of the stuff are cut at one operation. It is supposed that at least one fourth of the labor in making sash in this way will be saved from that of any other method now in use.—*Syracuse Gazette.*

Planting of oaks.—If the country gentlemen do not make it a point to plant oaks wherever they will grow, the time will not be very distant, when, to keep up our navy, we must depend entirely on captures from the enemy. You will be surprised to hear that most of the knees which were used in the Hibernia, were taken from the Spanish ships captured on the 14th of February; and what they could not furnish, was supplied by iron. I wish every body thought on this subject as I do; they would not walk through their farms, without a pocket full of acorns to drop in the hedge side, and then let them take their chance.—*Lord Coltingwood's Correspondence.*

Stings of Wasps or Bees.—Sweet oil, applied immediately cures the sting of wasps or bees;—and if the sting is left in the wound, it should, if possible, be extracted with hair pincers. Or chalk may be rubbed on the place, or spirits of hartshorn, or solution of any alkali, as pot-ash, pearl-ash, or salt of tartar, or soda. But the simplest remedy, and some who have tried it have assured us that it is effectual, is to rub the part affected with a raw onion.

The New-York Statesman estimates the amount of wood consumed in the Steam Boats on the North River as follows:—Thirteen Boats between New York and Albany require about 1,500 cords of wood per week. The ferry boats crossing the Hudson about 1,400 more; besides the amount by the way boats to Singing, Newburgh, Poughkeepsie, Catskill, &c.; making a consumption of more than three thousand cords of pine wood per week for generating steam on the North River.—*Con. Courant.*

GARDENER'S CALENDAR—MAY.

Sow hardy aromatic herbs, if not done last month. Small salads four times in the month for a complete succession. Radishes and lettuce thrice. Peas and beans once a-week. Spinage once a-fortnight. Carrots, for late drawing, twice in the month. Borecole, in the first week, for a second main crop. Dwarf kidney-beans, in the first week, for a full crop in July; in the last fortnight, for crops in August and September. Borecole and Brussels sprouts for the last crop, and German greens to come in for spring. Savoys for the last crop. Onions for drawing, young leeks to be late transplanted, cauliflowers in the second and third weeks for a Michaelmas crop. The less hardy aromatic herbs, and pumpkins, the last fortnight. Cucumbers for pickles on a dry warm border, in the last week.

Protection. Continue this, nightly, for kidney-beans and tender plants transplanted from hot-beds.

Propagate by bulbs and dried roots. If abundance of potatoes have not been planted, effect this as early as possible; in late situations they may be planted till the middle of June.

Plant slips and offsets.

Transplant the cabbage tribe, lettuce, celery, radishes, and other plants for seed.

Routine culture. Stick peas, top early crops of beans, and also of peas; earth up cabbages, beans, peas, potatoes, &c. Thin, weed, hoe, and stir the surface among seedling crops. Water in dry weather, support stems, pinch off all decayed leaves, &c.

Destroy insects and vermin.

Hardy fruit department.

Plant strawberries, if it has not been done last month.

Prune what trees you have neglected, and run the risk of losing, or leave them unpruned till autumn as a proof of vigilance and skill. Summer prune vines, peaches, and other early shooting trees against walls, and such gooseberries as are planted there to produce early fruit. Remove all suckers, excepting selected ones of raspberries, and pinch off strawberry runners as directed for last month.

Routine culture. Mulch, protect, and water where necessary. Water strawberries over the herbage, and especially after the fruit is set.

Destroy insects, especially snails and caterpillars. On the first symptoms of the leaves rolling up, unroll them and pick out the grub before it does further mischief. Take special care it does not get at the petals of apple and pear blossoms.

Fruit-room. Look over the fruit of every description which the increase of temperature will now cause to taint rapidly.

Fruit-cellar. Open a few casks of such dessert apples and pears as are now wanted for the table. Close them as soon as you have taken out the proper quantity, and let them still remain in the cellar.

Straw paper.—Notice has recently been given in some of the papers, that straw may be converted into paper. There have been specimens of paper manufactured from oat straw, for some weeks past in the hands of several individuals in this village, and recently we have been informed of the process by which it is produced. The cohesive property, so necessary to the formation of paper, and which straw never was supposed to possess, is

communicated to that article simply by boiling it about twenty minutes in a solution of potash; after which, it is converted into paper by the usual process. The discovery was made at Meadville, Penn. and was the result of accident. In removing the ashes from a leach of long standing, the straw, at the bottom of the vessel, was observed to resemble wet tow, in its texture. This lint formed the basis of a course of experiments, which has resulted in the discovery above mentioned.—We understand the process has been patented. The specimens of the paper which we have seen, are such as leave no doubt that all wrapping, cartridge, and other coarse papers, requiring great strength, may be advantageously produced in future from straw, in preference to rags or old ropes.—*Buffalo Journal.*

Agricultural Convention.—A writer in the American Farmer suggests the expediency of an annual convention of delegates from the different states, to devise plans for the general improvement of the agricultural interests of the country, and to direct the attention of the public to those products most calculated to supply the wants and promote the prosperity of the country. He recommends some time in the summer, when the citizens of the south visit the north.

Ebenezer Baldwin, George Tibbets, and Oliver Wiswall, Esqrs., have been appointed by the Executive of New York, commissioners under the act for facilitating the construction of a rail-road from Boston to Hudson.

New York Horticultural Society.—At a meeting of the Inspecting Committee, April 29, the exhibition of flowers was uncommonly numerous and beautiful.

A bottle of currant wine was presented by Mr. Yuill. It was made in Scotland ten years ago, and consisted of nothing but the juice of a mixture of black and red currants, water and sugar; and although not a drop of distilled spirits had ever been added, yet it had spirit, and a lively and agreeable flavor. *Recipe.*—Three quarts of juice, one of water, and three pounds of brown sugar.—The management with respect to fermentation, is very similar to that for good cider.—*N. Y. Farm.*

GOATS.

These animals are numerous on the Eastern Continent, and great numbers are domesticated in Europe, especially in the mountainous parts. The Bulletin des Sciences states that there are 706,000 in the states of the king of Sardinia; and that 17,000 are kept in one flock, near Lyons in France. Goats are numerous in Spain, Italy, Switzerland, Wales, &c. They yield milk in large quantities, which is accounted the best milk of all animals. The goat is the poor man's cow in many parts of Europe. The unpleasant odor attending them, is supposed to be very beneficial to horses, and on this account they are often kept in stables in England. The goat is, however, a treacherous, roaring, mischievous animal.

The precious stuffs, that ornament the heads and shoulders of the rich inhabitants of Persia and Turkey, are manufactured in the vale of Cashmere, from the down of the Tibetan goat. These shawls were admired in France for their beauty, fineness, and elegance, and a great price was paid for them; but very few were seen there until Buonaparte defeated the Mamelukes in Egypt, and

took from them many shawls. They then became an object of fashion. The ladies could find no other stuff so light, which was so capable of preserving them from the impression of the air.—There was for some time a dispute among the French naturalists whether the material of these shawls was produced by the dromedary, lamb, or other animal.—They are now convinced that it is the down of the goats of Tibet. A large number of goats, called goats of Tibet, were purchased of the Kirghis Tartars in 1819, and introduced into France where they have greatly increased. It is believed, however, by many, that they are not Tibetan goats, and that they differ but little from the native race. The down begins to appear under the long hair, in October and grows until spring. When it is nearly ready to fall off, it is gathered with combs; and the combing is continued three or four days. The long hair is then separated from it by hand, there being no other way. Each animal gives from four to six ounces of the down. A shawl $5\frac{1}{2}$ quarters square, made from this down, weighs $6\frac{1}{2}$ ounces.—*Hamp. Gaz.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 16, 1838.

NETTLE, STINGING—*Urtica dioica.*

This perennial plant, found in dry, rubbishy soils, and in hedges, is but seldom seen where the hand of man has not been at work, and may therefore be considered a sort of domestic plant. In many parts of Europe the young shoots are gathered as a pot herb, for soups, &c. and the plant is forced in hot beds for similar purposes.—The Domestic Encyclopedia observes that "The Common Nettle, though generally considered as a noxious weed, is of extensive utility; its young tops may be boiled during the spring, and eaten as a substitute for greens; being not only nourishing, but mildly aperient. In the Western Islands of Scotland, a rennet is prepared, by adding a quart of salt to three pints of a strong decoction of nettles; a table spoonful of which is said to be sufficient to coagulate a bowl of milk. The leaves are employed for feeding poultry; and, especially in the winter, when boiled they promote the laying of eggs—in a fresh state, they are refused by horses, sheep, goats, cows and hogs; though asses devour them eagerly. When dry, they are eaten by cows, for which they are an excellent food, increasing the quantity, and improving the quality of their milk. According to M. Van Geuns, such fodder is an effectual preservative against the contagious distemper affecting horned cattle.

The roots of the Common Nettle, when boiled, communicate a yellow tinge to yarn. But the most valuable part is its fibrous stalk or stem; which, on being dressed in a manner similar to flax or hemp, has, in some parts of Europe, been advantageously manufactured into cloth. This useful branch of industry has also been attempted in Britain, and a coarse kind of durable canvas was produced, which is considerably harder than the cloth manufactured from hemp or flax. As, however, this plant requires a rich soil to obtain it in any quantities, and, as a much greater degree of attention and accuracy is necessary in the operation of rotting, than is requisite either for flax or hemp, Dr Anderson is of opinion, that the cultivation of the nettle will be attended with dif-

ficinity. From the rind, as well as the woody substance of the stalk, Dr Schaeffer has produced a very good white writing paper; though that manufactured by M. De Vilette, in France, was of a dark green colour. The seeds on expression, afford an useful lamp-oil.

In a medical view, the whole plant, and particularly the root, is esteemed to be *diuretic*; and has, therefore, been recommended in the jaundice and in nephritic complaints. A leaf, if placed on the tongue, and pressed against the roof of the mouth, is said to be efficacious in bleeding at the nose; and instances have occurred, in which paralytic limbs have been recovered by stinging them with nettles. If credit is due to some authors, the expressed juice of this plant is a valuable remedy to the asthmatic and consumptive.

Some interesting experiments have been made by M. Zanetini, in Italy; from which it appears that the flowers and seeds of the Common Nettle may, with efficacy be substituted for the Peruvian bark, in all febrile affections, especially in tertian and quartan agues. This native vegetable operates more speedily than the foreign bark; and, in large doses, induces a lethargic sleep: the portion to be given ought never to exceed one drachm, and should be administered in wine, two or three times in the course of 24 hours. The same cautions that are necessary in the use of the Peruvian bark, are likewise to be observed in taking the seeds and flowers of the nettle. Lastly, M. Zanetini recommends a slight infusion of the latter, in wine, as an excellent preservative for those who reside in marshy and unwholesome situations.

Domestic Encyclopedia.

DANDELION.

A valuable commodity on the cultivation of the dandelion in gardens, by Gen. DEARBORN, will be found on the first page of this day's paper. We think this vegetable bids fair to be a general and profitable occupant of our kitchen gardens.—The Caledonian Horticultural Memoirs assert that "The leaves [of the dandelion] in early spring, when just unfolding, afford a very good ingredient in salads. The French sometimes eat the young roots and the etiolated leaves with their slices of bread and butter. When blanched, the leaves considerably resemble those of endive in taste.—The root is considered an equally good substitute for coffee as chicory, and may like that plant, be stored in cellars or barrels for producing winter salad." Should the dandelion improve as much by cultivation, as the parsnip and carrot, which in their wild state are worth but little, it will be a great acquisition to our garden vegetables.

WASH FOR FRUIT TREES.

A gentleman, who has been greatly benefited in his horticultural pursuits by a wash for fruit trees, recommended by Mr. Berj Wheeler, of Framingham, Mass. the receipt for which was published in the New England Farmer, Vol. iv. page 348—advises us to republish said receipt, as it cannot be too generally known, nor too extensively practised. Mr. Wheeler's prescription is "to dissolve 2 pounds of potash of the first quality in 7 quarts of water for the bodies of trees. If the limbs are covered with moss or lice, I take a painter's brush and apply the solution to the moss, &c. with care not to touch the leaves or buds. It may be done at any time of the year, when we are most at leisure. Once in from two to four years is generally sufficient. I have no general rule, however, but

wash them as often as they appear to need it—which is always, when the bark is not smooth."

MANURE.

Farm-yard dung, it is well known, is greatly reduced in value by being exposed to the atmosphere in small heaps, previous to being spread; and still more after being spread. Its fertilizing qualities are exhausted by the sun—washed away by the rains, or diffused in the air, and what remains is worth but little. This is more particularly the case with long fresh dung, the greater part of which consists of straw wet with liquid manure, which may be almost wholly lost to the farmer, by evaporation; and as Mr. Arthur Young expressed it, be rather applied to "manure the atmosphere," than the soil for which it was intended. All careful farmers, therefore, spread and plough in their manure as soon as possible after it is brought to the land; and while it remains in the yard they expose it no more than can well be avoided to rain and sun-shine. The dung hills are often covered with earth, which receives and preserves for use the gaseous products of fermentation and decomposition; and the manure left by cattle in the open yard is either preserved by being mixed with straw, or other litter, or shovelled under a shed, where it is not liable to be washed away by rain or dried up by the sun.

The degree of decomposition to which farm yard dung should arrive before it can be deemed a profitable manure must depend on the texture of the soil, the nature of the plants, and the time of its application. London says, "in general, clayey soils, as more tenacious of moisture, and more benefited by being rendered incohesive and porous, may receive manure less decomposed than well pulverized turnip soil requires. Some plants, too, seem to thrive better with fresh dung than others, potatoes, in particular; but all the small seeded plants, such as turnips, clover, carrots, &c. which are extremely tender in the early stage of their growth, require to be pushed forward into luxuriant vegetation, with the least possible delay, by means of short dung.

"The season when manure is applied, is also a material circumstance. In spring and summer when it is used for grain or grass crops the object is to produce an immediate effect, and it should therefore be more completely decomposed than may be necessary when it is laid on in autumn for a crop whose condition will be almost stationary for many months more."—*Sup. Enc. Bri. art. Agri.*

LONG WOOL.

The British Society for the encouragement of arts, manufactures, and commerce, have awarded a premium to Charles Callis Western Esq. M. P. for a specimen of long and fine Anglo-Merino wool.

In a communication to the Society, Mr. Western thus describes a sample of this wool: "The wool will be of three years' growth next clipping time. I took it off this morning from the backs of two wether sheep. I drew it from the skin with quite as much difficulty as if it had only been of one year's growth, and with as much pain to the animals. You will observe the strength and elasticity of the wool, and the impossibility of discovering any difference in each successive years growth. I estimate the weight of one fleece at 25 lbs., the other at 28 or 30 lbs., in the grease.

The food of the sheep has been according to the season, tares and clover, green grass, hay,

turnips, mangel-wurtzel, and oats. Weight of the sheep alive, one 239 lbs., another 244 lbs., dead, one 158 lbs., the other 149 lbs.

I am more and more convinced I am right in the object at which I aim, that of growing long, fine, strong, Merino wool for combing. I am satisfied it is practicable, that the farmer who applies his attention and skill to his object, will find an adequate return in the sale of wool and mutton."

Mr. Western says in a subsequent communication, "The principal object that I had in view was, to make known the curious fact that the animal [the Anglo-Merino sheep] will carry its fleece in all its strength and beauty, three years. I have produced the article such as was never seen or contemplated before, most people supposing that sheep shed their fleece every year.

I do not propose the wool should be more than two years' growth, which would require one year's cutting. The sheep should be wethers, and put up at about sixteen or eighteen months old."—*Transactions of the Society for the Encouragement of Arts, &c. v. 45, p. 36, (1-27).*

New Holland—The London Quarterly Review has an article on Cunningham's "Two years in New South Wales," from which we gather the following particulars. England first sent convicts to New-Holland in 1788. At that time there was not a civilized being, nor an European animal on the Island. Now there are 40,000 inhabitants;—200,000 sheep; 100,000 cattle; three newspapers; two banks; several distilleries, one of which consumes 50,000 bushels of grain in a year; 32 steam wind, and water mills; 13 breweries; 50 vessels in the trade with England, China, India, &c.;—schools; churches; reading rooms; pianos; post offices; stage coaches; mechanics of all kinds;—thrifty farmers, &c. Of the adult inhabitants, about one half are convicts in servitude, one fourth convicts who have been emancipated, and one fourth free emigrants. There are three males to one female.

Sugar Beet.—A writer in the Paris *Bulletin of Sciences* for January 1828, says—that the sweet beet appears to prosper best in the northern climates—that the sugar is at least equal to that of the Antilles—and that the beet yields the greatest and best quality of sugar in the early part of the season.

The writer further remarks, that if the discoveries and improvements in this species of production shall continue to be made for a short time, with as good success as heretofore, the superiority of the cane for producing sugar will be of short duration. The above suggestions imply an extensive production of this article, of an amount sufficient to be taken consideration in the speculations and estimates respecting the West India trade.—*Boston Bulletin.*

Cheap and efficacious Manure.—Raise a platform of earth on the head-land of a field, eight feet wide, one foot high, and of any length, according to the quantity wanted. On this first stratum of earth, lay a thin stratum of lime, fresh from the kiln; dissolve or slack this with salt brine from the rose of a watering pot; add immediately another layer of earth, then lime and brine as before, carrying it to any convenient height. In a week it should be turned over, carefully broken, and mixed, so that the whole mass may be thoroughly in-

corporated. This compost has been used in Ireland; has doubled the crops of potatoes and cabages, and is said to be far superior to stable dung.—Gardener's Mag.

Law Intelligence.—A suit was tried last week at New-Haven, before the Circuit Court of the United States, in which Grant and Townsend obtained a verdict against Harrington and Brundage, of \$350, single damages, which the Court by law are bound to set threefold, making \$1050 damages and costs, for the violation of a patent for a machine to make Hat bodies. The Court also granted absolute and perpetual injunctions against the defendants in all the cases, prohibiting, under pain of imprisonment, all further violations of the plaintiff's Patent.

Water-proof Glue.—A correspondent of the Eastern Argus claims to have discovered a new method of making glue water proof. His method is to immerse the common glue in water till it becomes soft, and then dissolve it in raw linseed oil, with a gentle heat. He says it has all the properties of the common preparation, and is moreover completely impervious to water.

A foreigner was lately boasting on board a Steam Boat, that he had been 7000 miles in that mode of conveyance. An American gentleman present observed that he had been above 500,000! This was smiled at as a "Longbow story," but was true; the individual was Capt. Jenkins, who had been for sixteen years engaged in a steam boat on the Hudson, at the rate of 33,300 miles a year.

Mr. Reuben Seelye, a farmer of this town, has fattened three Swine, which he killed when they were nine months old, that weighed when dressed 984 pounds, their several weights being 336, 316, and 332 pounds.—Glens Falls Observer.

New Treatise on the Vine.—A resolution has been reported in Congress to authorize the purchase of 3000 copies of a Treatise on the cultivation of the Vine, by Mr JOHN ADLUM of Georgetown.

New South Wales.—In an extract from a New South Wales paper, published in the Asiatic Journal for February, it is stated that on a trial of the opium sent from New South Wales to Canton, it was found to be equal to the famous opium from Turkey, and the writer says "if we may place faith in one trial of its qualities, this article bids fair to become a very profitable export, if our cultivators will be at the pains to cultivate the poppy."—Boston Bulletin.

The London Courier of the 2d. April says, While the Medway, Capt Wight was in Bahia, re-feeding, on her voyage to New South Wales, a small schooner came from the coast of Africa, with 400 slaves. It appeared that she had originally taken on board 600 in all, male and female, but being chased by a ship of war, to prevent capture and to lighten the vessel, the captain had thrown 200 of them overboard!!

The night of the 6th April and the following morning, were colder at Pezococa than any that had been experienced in that winter. Ice was formed thicker than a dollar, and the gardens in the city and its vicinity, together with most of the fruit, were entirely destroyed.

Green Peas.—We are informed that green peas were on the table at the National Hotel, yesterday; and that to-morrow at 2 o'clock, at the same place, those who wish to enjoy this rarity can be gratified.—Dom. Press.

Encouragement of decency.—Dr Townsend, a very old colonist, died about six months ago in New South Wales—he left \$5000 to a Mr Spark, because, as it is expressed in the will, "he was a decent sort of a gentleman."

Five tons of Maple Sugar have been made the present season in the town of Lyndon, Vermont, beyond what is sufficient for the consumption of the inhabitants of the town

Tarragon Roots.

For sale at the New England Farmer Seed Store, a few roots of this herb, (growing in pots,) used in soups, salads, &c. price 50 cts. per pot. An account of this root from Cobbet's Gardener will be found in this week's paper.

Likewise roots of the Chives, in pots, price 37 1/2 cts. per pot.

Admiral.

The subscriber informs those disposed to improve by this fine imported animal, whose stock is beautiful, that he will be kept for this season only, on the Welles Farm, Dorchester. Terms \$3. A. GREENWOOD.

Wanted

A Bull 12 or 18 months old, well owned, of a red color, either full or three fourths English blood. Apply to Mr Russell, publisher of the N. E. Farmer, (if by letter, post paid.) in 16

Ornamental Flower Seeds.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in papers of six and a quarter cents each; likewise done up in packages comprising 20 varieties, each sort being labelled, at \$1 per package.

New Vegetables.

Just received at the New England Farmer Seed Establishment, a small invoice of rare and choice vegetable seeds, from Europe, comprising Large Green Artichoke of Laon, (considered the finest sort known, but very rare, even in Europe)—Brighton Cos Lettuce—New Silver Giant Celery—Asparagus of Allengue, a new and superior sort—Cremor Carrot from Holland fine for the table. For sale in packages of 12 1/2 cents each.

Gunpowder, &c.

Du Pont's Gun Powder, at 23 to 50 cts. per pound—Shot—Balls—Plugs and Percussion Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street—By E. COPELAND, Jr.

The Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask. Merch H

Landreth's Nurseries.—Near Philadelphia.

From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Bulbous Roots, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered, as containing none but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the time they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department, rich in native and exotic Plants,—it contains a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.

In the portion of ground allotted to Garden Seeds are grown almost every variety of Excellent Vegetables for seeding. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds, liable to mix in seed—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance undoubtedly conspires in an eminent degree, to obviate the errors so common, and so often in a general way, to cause our foreign importations, or our careless or inexperienced growers at home. Orders received by Parker & Cedman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.

Feb. 15. D. C. LANDRETH.

Bulbous Roots, &c.

Just received at the New England Farmer Seed Establishment, a fine collection of superior Bulbous Roots, suitable for sprang planting. Consisting of black, purple, orange, violet, crimson, rose, mackerel, bronze, and white colored DOUBLE MONTEEN DANIELIAS. Also, Ferraria Florida, or Mexican Tiger Flower—Amurellis Formosissima, or Jacobina Lily—Dahlia Tuberosa, and Ranunculids; paintings of which may be seen at this place. The above collection of Bulbs is in fine order, and is from the same House from which we obtained the Bulbous Roots last autumn, which gave such uncommon satisfaction.

Also, a further supply of Laciner and Potato Oats. Seeds of the China Tobacco, (Black and orange) Yellow Tobacco, Turkey Spring Wheat, Spring Rye, Barley, Rape, Broom Corn, Spring Vetches, Castor Oil Bean, Corn, (various sorts)—Weld, Yellow Locust, White Mulberry, Millet, Baruet, Orchard Grass, Rye Grass, Tall Meadow Oats, Grass, White and Red Clover, Mangel Wurtzel, &c.

ROMAN.

A very elegant, full blooded horse, imported at a large sum of improving the breed, will stand this season at the farm of Mr Stephen Williams in Northborough, county of Worcester. Roman was purchased in England of the Earl of Warwick—and his pedigree has been traced in the New Market Smithfield from Children, the swiftest horse that ever ran over New Market course, through eight generations of the highest bred horses and mares in England, without a single cross of inferior blood. At 4 years old he won five, and at 5 years old he won four prizes, and has since been beaten by the best horses in England over the most celebrated courses.

His colour a very bright bay—black legs, mane, and tail—walks and trot well—is very good tempered—high spirited—active—full fibred and a full hands high, and is considered by judges as handsome and well formed a horse—as can be found in the country.

Mares have been sent to him from all the New England States, as well as from the remote counties in this State and the neighboring towns, and his colts are handsome and command high prices.

Terms, \$20 the season, to be paid before the mares are taken away. Northborough, May 16, 1828.

Cow for Sale.

A superior Cow, three years old, having had two calves—of English breed, and has given nine quarts of milk per day, without any extra feeding, is offered for sale at \$75. She is sold for no fault—and being uncommon for the present season, to procure her. Inquire of James Holden, near the Touch Bow in Brookline. May 2

Bull, Young Cow.

This noble animal, (of the new improved Durham—best blooded stock) is from *Liberal* and *Auradella*, presented to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Coffin, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in his native State. He will remain at the farm of J. H. Derby, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be sold at \$3 for each Cow, payable in advance. The whole proceeds from this animal, (the present season) will be for the benefit of the Society. Cows sent from a distance will be taken care of, as desired, at a reasonable charge.

PRICES OF COUNTRY PRODUCE.

Table listing prices for various goods including Apples, Ashes, Beans, Beef, Butter, Cheese, Flour, Grain, Hog's Lard, Lime, Plaster Paris, Pork, Navy mess, Carrots, Seeds, Wool, and Provision Market items like BEEF, PORK, VEAL, BUTTER, EGGS, MEAL, POTATOES, and CIDER.

MISCELLANIES.

Deny every thing and insist upon proof.—Lawyer Acmoody (said our venerable friend) figured at the bar in Essex county, Mass. something like half a century ago. He had a student named Varnum, who having just completed his studies, was journeying to a distant town in company with his master. Acmoody on his way observed to his student—"Varnum you have finished your studies; but there is one important part of a lawyer's practice of great consequence, that I have not mentioned." "What is that?" inquired the student. "I will tell it," replied Mr A. "Provided you will pay the expense at the next tavern."—The student agreed: and Acmoody imparted the maxim at the head of this article. The supper, &c. were procured, and on preparing to set off from the tavern, Acmoody reminded Varnum that he had engaged to pay the bill—"I deny every thing and insist upon proof," retorted Varnum. The joke was so good, that Acmoody concluded it best to pay the bill himself.

Insect labors.—There are buildings by animals far inferior to man in the scale of creation, many times more vast in proportion than his mightiest labors. The cube of one of the African ant-hills is five times larger than the great pyramids of Egypt, in proportion to their size. "These," Sweetman says, "they complete in four or five years; and thus their activity and industry as much surpass those of man, as St. Paul's Cathedral does the hut of an Indian." These ants are again exceeded by the coral insect of the South Sea, that raises islands out of depths almost unfathomable. What lessons for human pride and human power!

Complaisance, though in itself scarcely to be numbered among the moral virtues, is that which gives a lustre to every talent a man can be possessed of. Complaisance renders a superior amiable, an equal agreeable, and an inferior acceptable. It smooths distinction, sweetens conversation, and makes every one in company pleased with himself. It produces good nature, and mutual benevolence, soothes the turbulent, humanizes the fierce, and distinguishes a society of civilized persons, from a confusion of savages. In a word, complaisance is a virtue, that blends all orders of men together, in a friendly intercourse of words and actions, and is suited to that equality in human nature, which every one ought to consider, and value so far as is consistent with the order and economy of the world.

Three wanderers of women.—1st At fifteen, they wonder who they shall take. 2d At twenty-five, they wonder whom they shall get. 3d At thirty-five, they wonder who will take them.

Curious fact.—Cut a couple of cards, each into a circle of about two inches in diameter—perforate one of these at the centre, and fix it on the top of a tube, (say a common quill)—make the other card concave, and place it over the first, the orifice of the tube being thus directly under, and almost in contact with the upper concave card; try to blow off the upper card, and you will find it impossible. We understand that the cause that counteracts the effect as first expected at this singular phenomenon, has lately puzzled all the members of the Royal Society of London. A medal and a hundred guineas are said to be the reward of the

successful discoverer. [We have just tried this experiment, and to our no small surprise, find that what is stated above is true.—Edits. Merc.

Infant Corse.—If any object which impresses the mind with solemn sadness, can, at the same time, infuse the pensive charms of melancholy pleasure, it is the innocent and beautiful corpse of an infant, when the chill of death has stilled the pulse of life, and the countenance, which had been changed by disease and distorted by distress, has resumed its native placid sweetness—then to gaze upon the lovely features, though cold in death, is a sight too touching and beautiful, not to awaken all the tender emotions of the heart and soul.

The fair forehead, adorned with a few little curls of soft and elegant hair—the cheeks, though no longer suffused with the glow of health, yet more beautiful than the most perfect production of the statuary—the lips, that prattled so sweetly in life, with a light tinge of the coral still remaining, looking as though they yet might speak—the neck and shoulders, of delicate whiteness and finished symmetry—the little hands and arms, more beautiful in death than life, crossed on the bosom that has ceased to beat—who can behold such an assemblage of loveliness, without being softened down into tenderness, and freely bestowing the consecrating tear of affection and humanity?

The rose is more beautiful when its petals are but partially disclosed, than when expanded to their greatest extent; so the beauties of infancy, checked in their unfoldings, are lovely in death.

Nantucket Enquirer.

A Mr. Rand advertises for exhibition, in Boston, a solar microscope, which magnifies three million times. By its aid, snakes, apparently six feet long may be discovered in vinegar; and the small particles on figs, appear moving objects as large as a good sized terrapin. It must be a pleasant circumstance, to have ocular proof, that while we are licking up the vinegar from our salad, we are taking serpents to our bosoms. What a comfortable reflection, as one is munching a fig, to mistake, in the fullness of newly acquired knowledge, the cracking of one of its seeds for the crushing of a snapping-turtle's shell.—U. S. Gaz.

A gentleman, an attentive observer, who keeps a store in the southerly part of Boston, has ascertained that a stage coach passes his premises every four minutes in the day. This, probably, includes the numerous hourlies between Roxbury, Dorchester, &c. About one in every twenty minutes passes Charlestown bridge, during the whole twenty-four hours.

An improved method of preparing corn for planting.—Soak the corn in warm water, for thirty-six hours—then, for half a bushel of corn, boil three pails full of water with half a pint of tar, taking care to stir the water until the tar is thoroughly mixed with it. Cool the water until you can hold your hand in it without inconvenience; then put the corn into the liquor—keep it in about five minutes, stirring it constantly—then put the corn into a basket, and put in as much plaster as will adhere to the kernels. Let it remain in the basket twenty-four hours, when it will be ready for planting. Corn prepared in this way will come up several days sooner, than that planted in the common way. This has been found by experience to be a complete preventive against the ravages of crows, wire-worms, and all other insects.

New Hampshire Statesman

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 32 North Market Street, Boston, the largest variety of Seeds to be found in New England—of the crops of 1857. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

<i>Artichoke,</i> Green Globe	<i>Letuce,</i> Early Curled Head
<i>Asparagus,</i> Devonshire	Large Green Sicilian
Gravesend	Royal Cape
Batiscan	Imperial
Large white Reading	Early Green
<i>Beans,</i> Early Yellow Cranberry	Brown Dutch
Early Mohawk	Grand Admiral
Early York six Weeks	Tombsall, or Rose
Early Canada Dwarf	Drumhead
Early China Dwarf	Magnan Bonum Cass
Dwarf Kidney	Earl's Coss
White Kidney Dwarf	Ice Coss
White Cranberry Dwarf	White Coss, or Leaf
Red Cranberry Dwarf	Green Coss
Washington or Marrow	Pine Apple
Thousand or One	Green Gherkin
Large White Lima	Persian
Saba, or Carolina	Nutting
Red Cranberry string	Large Canteleupe
White Cranberry string	Pomegranate, or Musc
Broad Windsor	Carolina Water
Field	Long Island Water
<i>Beets,</i> true Long Blood	Apple seeded, Water
Early Blood Turnip	<i>Macaroni</i>
Early White Scarcity	Mixed, White and Brown
French Sugar, or Amber	Nasturtium
Orange	Mangel Wurtzel,
Green, (for soups, &c.)	<i>Onion</i>
<i>Borecole</i>	Potatoe
<i>Brocoli,</i> Early White	Tree
Early Purple	White Portugal
Large Cape	Yellow
<i>Brussels Sprouts,</i>	Madeira
<i>Cabbage,</i> Early Salisbury dwarf	Strasbourg
Early York	Large Red
Early Dutch	Siberian
Early Sugarloaf	<i>Parsley,</i> Dwarf Curled
Early Lon. Bateasca	Curled, or Double
Early Emperor	<i>Parsnip,</i> Large Dutch swelling
Early Wellington	Silver Skinned
Large Bergen, &c.	<i>Peas,</i> (14 varieties.)
Large Cape Savoy	<i>Peppers,</i> Large, or Cayenne
Large Scotch	Tomato, or Spanish
Large Green glazed	Bell
Large late Drumhead	' Cherry
Tree, or 1000 headed	<i>Pumpkins,</i> Finest Family
Green Globe Savoy	Connecticut Field
Red Dutch	Blaghum
Yellow Savoy	<i>Radish,</i> Early Frame
Turnip rooted, &c.	Short top Scarlet
Russian	Long Salmon
Late Imperial	Purple Short Top
Late Sugarloaf	Long white, or Naples
<i>Cardoon</i>	Cherry
<i>Carrots,</i> Aitringham	Violet colored
Early Horn	White Turnip Rooted
Blood Red (for West India market)	Black Fall, or Spanish
Lemon	<i>Rhubarb,</i> for tarts, &c.
Long Orange	<i>Ruta Baga,</i>
Cremer	Salsify, or vegetable oyster
<i>Cauliflower,</i> Early and Late	<i>Sau Kute,</i>
<i>Celery,</i> White solid	Skurrt
Rose coloured solid	<i>Scorzonera</i>
Italian	Saffron
<i>Chervil,</i>	<i>Spinach,</i> New Zealand
<i>Chives,</i>	Prickly, or Fall
<i>Corn Salad,</i> or Vorkist	Round leaved summer
<i>Cress,</i> Curled or Peppercress	Eng. Patience Dock
Broad leaved or Garden	<i>Sage,</i>
Water	<i>Squash,</i> Early bush Summer
Long Orange	Long Crook Neck
<i>Cucumber,</i> Early Frame	Vegetable Marrow
Green Cluster	Porter's Valparaiso
Short Prickly	Acorn
Long Prickly	<i>Tomatoes</i>
Long green Turkey	<i>Turnips,</i> Early White Dutch
Long white Turkey	Early Garden Stone
White Spined	White Flat, or Globe
Small Girkim, &c.	Green Round
<i>Egg Plant,</i> Purple	Red Round
White	Swart's Egg
<i>Endive,</i> Green	Large Eng. Norfolk
White Curled	Long Traikard
Broad leaved Batavian	Long Yellow French
<i>Garden Broom</i>	Yellow Dutch
<i>Garlic Sots</i>	Yellow Maltese
<i>Indian Corn,</i> (several varieties)	Yellow Aberdeen
Kale, Sea	Yellow Stone
Purple curly	White Swedish
Green curly Scotch	<i>Thyme—Sweet Basil—Boneset.</i>
Large Scotch	<i>Lavender—Rosemary—Hyssop.</i>
	<i>Wormwood—Summer Savory.</i>
	<i>Pennyroyal—Spinaard—Dill.</i>
	<i>Balm—Rancy—Bore, &c.</i>

AGRICULTURE.

PLASTER OF PARIS, CLOVER, &c.

The following extracts are from a "Series of Papers, communicated for the American Farmer, by Geo. W. Jeffreys, Esq. of North Carolina.

"I have been in the habit of using plaster more than twenty years, and its effects on every kind of vegetation (sedge grass excepted which it diminishes) are surprisingly great. There is no arable land left unsown with clover seed here—neither is plaster of so much benefit to land left bare of grass; plaster is not a manure but a stimulant; it stimulates clover, and clover manures the land;—three pecks of plaster are enough as a top dressing for one acre, and all kinds of small grain including hemp and flax are benefitted by the same quantity to the acre. Early in the spring we sow plaster on our clover pastures and grain fields;—our sheep are not permitted to run in the clover fields in the winter, and are kept out in the spring, until the clover is well grown;—at this time also hogs are permitted to graze upon it, and if they are well salted will thrive as long as clover lasts. The second crop injures the stock, particularly horses, very much by creating a slavering, and it is best to keep them off, and devote the second crop to seed. We generally salt our clover hay, and put it under cover, not much together; mixing it with straw answers a good purpose. In saving clover seed the heads should be gathered quite dry, and kept in that state until sown. Those who sow seeds for market too often heat it, which prevents it from coming up; the good or bad quality of clover seed may be discovered by filling a glass tumbler half full of water and dropping a few seeds in. Those which sink are good, those that swim are generally deprived of their vegetating powers.—Clean seed should be sown in the following manner. Let the weather be calm (which is also necessary for sowing plaster) and let the ground be laid off into eight feet lands:—take as much seed as you can between your thumb and two fingers for every two casts or steps, and let the casts not exceed the width of the land."

PLASTER OF PARIS APPLIED TO SEEDS.

Not only Indian Corn, but Peas, Oats, Buckwheat and probably most other seeds are benefitted by wetting them with water and then rolling them in plaster.

From the New York Statesman.

FRUIT TREES.

What are you doing there madam? said I last summer, to an industrious and amiable young lady, who herself takes the care of her flower, fruit, and kitchen garden; for mercy sake! what are you doing there? Don't you see, answered she; I am scalding this peach tree. Do you want to kill it? On the contrary, I wish to save it if I can; the root is worm-eaten—the leaves are curling and withering—it will be dead in a few days, if I do not apply an efficacious remedy. I have lost several fruit trees this summer by the worms; in vain have I tried all the means suggested, as to dig round—look for worms—use a wire to kill them

through the apertures—put lime, ashes, &c. all in vain. Once the trees are attacked, they invariably die. This is the best tree of the garden; it produces the most excellent fruit. I am determined to try on it an experiment, which I have for a long time thought of, but from which I have always been discouraged by my friends saying "that will kill the tree. But the tree is already as if dead, and I think there is even prudence in the trial, since it leaves at least a possibility—a hope of saving it.

A great deal of conversation followed that experiment; some laughed, some found it absurd. I myself visited and examined with anxiety the tree every day. To our great surprise and satisfaction, after the fall of the faded leaves, the vegetation resumed all its activity, and a new set of beautiful, long, green leaves again covered the tree. Encouraged by this success, all the fruit trees of the garden, sound or not, were scalded before the setting in of winter.

The brother of the young lady having taken confidence in the operation, and having himself an orchard of a hundred and fifty fruit trees, apples, pears, plums, peaches, &c. of which a few were also worm-eaten, took the resolution to have them all scalded before winter. An iron kettle was brought into the orchard, kept boiling, (water added from a neighboring brook in proportion as it was used) and three or four quarts poured at the bottom of each tree, about one foot above the ground; care was taken to cause the water to follow the trunk and penetrate to the roots, by pouring it round the tree, and not too fast. This was done to each tree in the orchard with the greatest ease in less than half a day's labor. The same operation was performed again in the spring as soon as the frost was out of the ground. Not a single tree died. Those in bad order revived, and they are all recovered with the most luxuriant blossoms.

This discovery, for it well deserves the name, will certainly rank among the most useful. I hasten to send it for your valuable paper; it should be reprinted in all the publications of this country, for it might save many thousand fruit trees this season from destruction, if known by all gardeners and farmers.

In former times, a young lady who had become a benefactress of her own country, by her ingenuity and industry, would have received, as a reward, a crown of the finest flowers, with a basket of the best fruit; but in these dry modern times, let her, at least, receive our best thanks. D. C.

From London's Encyclopedia of Gardening.

TO ACCELERATE VEGETATION.

Accelerating by the form of surface consists in forming beds or banks in an east and west direction, and sloping to the south, forming an angle with the horizon, the maximum of which, in garden soils, cannot exceed 45 degrees. On such beds early sown crops, as radishes, peas, turnips, &c. will come much earlier, and winter standing crops, as lettuce, broccoli, &c. suffer less from severe weather than those on a level surface. The north side of such beds or ridges may be used

for retarding vegetation, as leeks, borecoles, &c. Acceleration by shelter, and exposure to the sun, is the simplest, and probably only primitive mode of accelerating the vegetation of plants. And hence one of the objects for which wall and hedges are introduced in gardens. A May-duke cherry, trained against a south wall, and another tree, of the same species, in the open compartment of a sheltered garden, were found, by the late J. Kyle, of Moreland, near Edinburgh, on an average of years, to differ a fortnight in the ripening of their fruit. In cold, damp, cloudy seasons, they were nearly on a par; but in dry, warm seasons, those on the wall were sometimes fit to be gathered three weeks before the others. It may be here remarked, that though, in cloudy seasons, those on the wall did not ripen before the others; yet their flavor was, in such seasons, better than those of the others, probably from the comparative dryness of their situation. Corn and potatoes on the north and south sides of a hill, all other circumstances being equal, ripen at about the same relative distance of time.

Accelerating by soils is effected by manure of all sorts, but especially by what are called hot and stimulating manures and composts, as pigeons' dung for cucumbers, blood for vines; and, in general, as to soils, lime rubbish, sand, and gravel, seem to have the power of accelerating vegetation to a much greater degree than rich clayey or loamy soils, or bog or peat earth.

Accelerating by previous preparation of the plant is a method of considerable importance, whether taken alone, or in connection with other modes of acceleration. It has long been observed by cultivators, that early ripened crops of onions and potatoes sprout, or give signs of vegetation, more early next season than late ripened crops. The same of bulbs of flowers which have been forced, which re-grow much earlier next season, than those which have been grown in the open air. It was reserved to Knight, however, to turn this to account in the forcing of fruit trees, as related in a paper, accompanied as usual by what renders all the papers of that eminent horticulturist so truly valuable—a rationale of the practice.

AGRICULTURAL SOCIETIES.

The benefits of these associations have been felt by the agricultural interest of our country, which has been essentially promoted by the diffusion of practical and scientific information on subjects connected with the business of the farmer. Within some twenty years that these societies have existed, crops of many of the products of the soil have doubled and a general increase taken place in others. The breeds of animals, particularly sheep and kine, have improved by crosses with such animals as were imported by some Agricultural Society or by some individual member; and a very visible improvement has taken place in the implements of husbandry.—Boston Patriot.

Tooth-Ache.—A remedy for this most painful affection which has succeeded in ninety-five of a hundred cases, alms reduced to an impalpable powder 2 drachms, nitrous spirit of ether 7 drachms mixed and applied to the tooth.

FOR THE NEW ENGLAND FARMER.

WORMS IN APPLES.

It is now about time for the insects to begin to deposit their eggs in the young apples and plums. At the time the apple is about the size of a cherry stone the insects make small holes, and leave their eggs. The holes look as though they were made with the point of a penknife. Their eggs are not so big as a seed of herds grass, with the hull rubbed off. In about ten days, the egg becomes a very small maggot with a black head, and commences his march in all directions through the apple till the worm and apple that does not drop off get to full size. One may see the insect very busy about the trees. Its body is about the size and color of the wire worm, wings long and narrow, legs very long, wire shape, resembles the musquetoe. They often get into houses and flutter about the windows. I have known many plum trees of the best kind that never would hold their plums till they were more than half grown, the owners tired of looking for fruit would cut them down. The cause of their dropping off, I believe to be nothing but worms. Would it not be worth while to cover some branch of such trees with a piece of millinet for an experiment, — the covering would not be needed but a few days. I wish some one that has time and skill would find a preventive for this evil. M. FRENCH.

Salisbury, May 19, 1828.

From the American Farmer.

WASHING SHEEP.

J. S. SKINNER, Esq. *Steubenville, May 1, 1828.*

Dear Sir,—I have just received yours, enclosing a letter from one of your subscribers, on the subject of washing wool on the sheep's back; a task performed in this country with very little trouble or expense.

We make a pen, of boards or fence-rail, large enough to hold the flock, (of three or four hundred sheep) immediately on the margin of some running stream, which is made to form one line of the enclosure. The men employed to wash the animals, take them, one at a time, (each man taking one) from this fold into the water, about waist deep, or nearly to their arm-pits, where they rub and press the wool with their hands and arms, until the water runs out entirely clear, which, generally speaking, will occupy from three to five minutes. They are then taken to the shore, either above or below the pen, as most convenient; and after the water is carefully pressed from the wool are turned loose upon a dry spot, leading, if practicable, to the pasture fields. On the fourth or fifth day they should be shorn.

Four or five active men, beginning at an early period in the morning, will wash from six to eight hundred by five o'clock in the afternoon, at which hour the washing should cease, in order that the sheep may, in some measure, become dry before sun set. I need hardly add, that the utmost care should be taken to keep the mouths of the poor animals above water, and that they should be handled carefully and gently in all respects.

We use no material but cold water in this operation, the natural grease in the wool possessing a saponaceous quality which renders the washing perfectly easy.

Pray tell your correspondent that he need not fear washing money out of his pocket into that of the poor manufacturer, who requires, at the pre-

sent juncture especially, all the aid that can be given; and that it adds greatly to the reputation of his flock, to have the fleeces well washed, well logged, and well put up!

Very respectfully,

Your obt. servant,

W. R. DICKINSON.

From the Democratic Press.

SOAP SUDS A MANURE.

A few years ago my attention was attracted by the soil of my garden, reduced to a state of poverty unfriendly to vegetation. Interest in all its future produce, influenced my wishes for its restoration. An invigorating manure was necessary; — but such a stimulus could not easily be procured. While considering which of the succedanea within my reach, had the greatest probable appearance of succeeding, it occurred, that possibly some trivial advantage might be derived from the soil and alkali suspended in the waters of a washing. — Pits were immediately ordered to be made, and in them, the contents of a tub, which my servant usually committed to the common sewer, were carefully deposited; as washing succeeded washing, other pits were dug and filled, so that the whole garden, a small portion excepted, has in this manner been watered and enriched; that small portion remains a visible demonstration of the utility of this manure. There vegetation is still languid; while the rest of the garden, invigorated by the suds only, annually exhibits a luxuriance almost equal to any thing this fertile neighbourhood can produce.

Remarks on the above by the Rev. Thomas Falconer.

I The above important experiment may perhaps remind the reader of the principal ingredients of the oil-compost, suggested by Dr Hunter, of York. In this simple fluid manure we have an animal oil, and the same alkali; but neither of them perhaps, in so pure a state as in the manure, with the addition of fresh horse dung. The fresh horse dung is added in order to produce heat and fermentation: and a delay of six months is supposed to be necessary, to make the compost fit for use. All, however, that seems to be gained by the horse dung, is the animal oil, which may be united with the alkali during the progress of fermentation, and the straw, which in the fermentation of the compost will bind the mass together, and when decomposed on the ground, will afford a small supply of vegetable matter. If we make the comparison strictly accurate, on the other side, we may observe, that in the fluid manure there must be an increased quantity of animal matter in the water after it has been used for the purpose of washing linen.

The experiment then shows what is the advantage of the application of the oil and alkali only, as a manure, and perhaps the delay of 6 months in preparing the compost would not be compensated by any superior efficacy, that may be expected to rise from the combination of horse dung. It also appears from the experiment, that the compost is a more useful discovery than Dr. Hunter himself could justly infer from his own limited experience of its effects.

2 This mixture of an oil and alkali has been very generally known than adopted, as a remedy against the insects which infest wall fruit trees. It will destroy the insects which have already formed their nests and bred amongst their leaves. When used in the early part of the year, it seems

to prevent the insects from settling upon them; — but whether by rendering the surface of the leaf disagreeable to the bodies of the animals, and thus repelling them, or neutralizing the acid they deposit, and thus preventing the leaf from contracting into a necessary form for their reception, I cannot presume to determine. — One of the modes by which this mixture indirectly contributes to the fertility of the ground, may be by its destruction of the insects, which prey upon the plants. It is also, I think, to be preferred to the lime water, as well as the wood ashes and lime, which Forsyth recommends to be used for the removal of insects. It is preferable to the lime water and the lime, because lime loses its causticity, and with that its efficacy, by exposure to the air, and must consequently be frequently applied; and to the dredging the leaves with the fine dust of wood ashes and lime, because the same effect is produced by the mixture without the same labor, and is obtained without expense.

Mr. Speechley, in his treatise on the vine, published in 1796, has used this mixture with great success; but he has applied it awkwardly and wastefully. He directs it to be poured from a ladder out of a watering pot over both trees and wall, beginning at the top of the wall, and bringing it on in courses from top to bottom. Mr. Speechley is not the first person who has thought of this application of the mixture. It is a fact which has long been known and neglected.

A considerable extent of wall may be washed by means of a common garden pump in a short time; and this operation should be repeated as a supply of a mixture can be procured; or if the water of a washing cannot be had, a quantity of potash of commerce dissolved in water may be substituted. The washing of the trees and wall twice a week for three weeks in the spring will be sufficient to secure them from the injuries of these insects. On the whole, then, this must be considered as a valuable manure, as it can be obtained easily, at small expense, and in large quantities; and when its nature is well understood, will probably be no less esteemed by the farmer than horse dung. To the gardener as well as the farmer, it is useful mixed with mould as a fertilizing compost; or when fluid may be applied to his fruit walls as a wash fatal to the noxious brood of predatory insects. — *Nicholson's Jour* V. 20.

Remarks of a Countryman.

The discovery of soap suds as a manure, is worthy of the consideration of agriculturists generally. In addition to the applications of oil, pointed out by Mr. Falconer, I have used it with some success in the preservation of cucumber vines from the bugs which are detrimental to them. I also think that water and muskmelon vines might be preserved from the bugs by a timely application of suds. The advantages of it are not sufficiently known. Future experiments, I am disposed to believe, will stamp a value on it far beyond what we at present conceive or anticipate.

A COUNTRYMAN.

The citizens of Bellows Falls have given notice that a boat will ply weekly between that place and Hartford, Con. during the season.

THE GOOSEBERRY.

In Piedmont, where it is found wild, and the berries eatable, but astringent and neglected, is called *griselle*. Some derive our name; gooseber-

ry from gooseberry, or the resemblance of the bush to gorse; others, as Professor Martyn, from its being used as a sauce with young or green geese.—Gerrard says, it is called feaberry (feaverberry) in Cheshire, and it has the same in Lancashire and Yorkshire. In Norfolk this term is abbreviated to foabes, or, as they pronounce it, fabes. Carberry is another British name for this fruit. The gooseberry-bush is a low branching, prickly shrub, with trilobate sub pubescent leaves, one-flowered nodding peduncles, and penulous berries, hairy or smooth. It is a native of several parts of Europe, and abounds in the Vallais in conseedwoods, where it produces a small, green, hairy, high-flavored fruit. In England it is naturalized in various places on old walls, ruins, and in the woods and beiges about Darlington. It is cultivated in greater perfection in Lancashire than in any other part of Britain; and next to Lancashire, the climate and treatment of the Lotmans seem to suit this fruit. In Spain and Italy the fruit is scarcely known.—In France it is neglected and little esteemed. In some parts of Germany and Holland the moderate temperature and humidity of climate seems to suit the fruit—but in no country is its size and beauty to be compared with that produced in Lancashire, or from the Lancashire varieties cultivated with care in the more temperate and humid districts of Britain. Neill observes, that when foreigners witness our Lancashire gooseberries, they are ready to consider them as forming quite a different branch of fruit. Happily this wholesome and useful fruit is to be found in almost every cottage garden in Britain; and it ought to be considered as a part of every gardener's duty to encourage the introduction of its most useful varieties into these humble enclosures. In Lancashire, and some parts of the adjoining counties, almost every cottager who has a garden, cultivates the gooseberry, with a view to prizes given at what are called gooseberry prize meetings; of these there is annually published an account, with the names and weight of the successful sorts, in what is called the *Manchester Gooseberry Book*. The prizes vary from 10s. to £5 or £10. The second, third, to the sixth and tenth degrees of merit, receiving often proportionate prizes. There are meetings held in spring to "make up," as the term is, the sorts, the persons, and the conditions of the exhibition; and in August to weigh and taste the fruit, and determine the prizes. In the gooseberry-book for 1819 is an account of 136 meetings; the largest berry produced, was the *top-sawyer* seedling, a red fruit, weighing 26 dwts. 17 grs.—46 red, 33 yellow, 47 green, and 41 white sorts were exhibited, and 14 new-named seedlings, which had been distinguished at former meetings, stated as "going out" or about to be sold to propagators.

Use.—The fruit was formerly in little esteem; but it has received so much improvement, that it is now considered very valuable for tarts, pies, sauces, and creams, before being ripe, and when at maturity it forms a rich dessert fruit for three months; and is preserved in sugar for the same purpose, and in water for the kitchen. Unripe gooseberries can be preserved in bottles of water against winter: the bottles are filled with berries close corked and well sealed; they are then placed in a cool cellar till wanted. By plunging the bottles, after being corked, into boiling water for a few minutes, (heating them gradually to prevent cracking,) the berries are said to keep better.—*London's Encyclopædia of Gardening.*

USEFUL RECEIPTS.

Celery Sauce for Roasted or Boiled Fowls.—

Take a large bunch of celery, wash it very clean, cut it in little thin bits, and boil it softly in a little water till it is tender, then add a little beaten mace, some nutmegs, pepper and salt, thickened with a good piece of butter rolled in flour, then boil it up and pour it in your dish; you may add a half pint of cream, a glass of white wine, and a spoonful of catsup.

Brown Celery Sauce.—Stew the celery in a little water, then add mace, nutmeg, pepper, salt, a piece of butter rolled in flour, with a glass of red wine, a spoonful of catsup and half a pint of good gravy, boil all those together and pour them into the dish.

To dress Calf's Head Soup.—Take a calf's head, (with the skin on if you can get it) part of the liver and lights, boil it in six quarts of water, until you can take the bones out, put it on a dish, season it with pepper, salt, and sweet marjoram, thyme and sage, mace and cloves, skim the water if there be any fat on it, then put it all back in the same water that you boiled it in, and let it boil till done; just before you take it up, put one glass of wine and brown it with a little burnt sugar, thicken it with a little butter and flour.—If you want to make a great deal of soup, you must add a knuckle of veal, as the head only will not make it rich enough, fry some forcemeat balls and put in it. If you wish to make the dish without soup, boil the head in the same way, and season it in the same manner, in the dish, with a little of the water it was boiled in, thicken it a little with butter and flour, put it in the oven till you think it is done.

Pea Soup.—To two quarts of peas put two gallons of water, three large onions, a handful of parsley, a little thyme, pepper, and salt.

Mrs. G's Famous Buns.—One pound and a half of flour, (a quarter pound left to sift in last) and a half a pound of butter cut up fine together; then add four eggs beat to a high froth, four teacups of milk, half a wine glass of brandy, wine, and rose water each, and one wine glass of yeast; stir it all together with a knife, and add half a pound of sugar, then sift in the quarter of a pound of flour, and when the lumps are all beaten fine, set them to rise in the pans they are to be baked in. This quantity will make four square pans full.

Black Cake, much esteemed.—Three pounds of butter and three pounds of sugar beat to a cream, three glasses of brandy and two of rose water, twenty-eight eggs, and three pounds of flour added by degrees together, six pounds of currants, six pounds of seeded raisins, one ounce of cinnamon, one ounce of nutmeg, three quarters of an ounce of cloves, half an ounce of mace, one pound of citron. (Two large loaves baked five hours.)

A beautiful specimen of American Leghorn, was yesterday left at Mrs. Tew's for inspection by the ladies. It was manufactured of the native spear grass of our meadows, by a young lady of Danvers, [Mass.] and for the beauty and neatness of workmanship, surpasses the imported Leghorn of No. 50. We hope some of our munificent ladies will be the purchaser of this superb article at a liberal price, as a reward of native ingenuity and industry.—*Provi. Am.*

BOSTON PUDDING.

Make a good common paste with a pound and a half of flour, and three quarters of a pound of butter. When you roll it out the last time, cut off the edges, till you get the sheet of paste of an ever square shape.

Have ready some fruit sweetened to your taste. If cranberries, gooseberries, dried peaches, or damsons, they should be stewed, and made very sweet. If apples, they should be stewed in a very little water, drained, and seasoned with nutmeg, rose-water and lemon. If currants, raspberries, or blackberries, they should be mashed with sugar, and put into the pudding raw.

Spread the fruit very thick, all over the sheet of paste, (which must not be rolled out too thin.) When it is covered all over with the fruit, roll it up, and close the dough at both ends, and down the last side. Tie the pudding in a cloth and boil it.

Eat it with sugar. It must not be taken out of the pot till just before it is brought to table.

Scotch Broom, or Spartium scoparium.—This shrub, which is in such great plenty in different parts of Scotland, England, and Ireland, as to subserve one of the commonest purposes of the household, is also one of the most ornamental shrubs that can aid to decorate the shrubbery. It grows to the height of six feet; the branches are very numerous and flexible, and the bark is quite green, the leaves are both simple and trifoliate.

The upper part being of the former, and the lower part of the latter description; these will be sometimes retained by the plant for a portion of the winter, but when entirely divested of foliage, its numerous shoots being green, give to it a pleasant appearance. It is the flowers, however, which constitute its principal beauty; these expand in the month of May; they are large and yellow, of a papilionaceous form, and are produced in such profusion in some seasons, as almost to cover the shrub; the seeds grow in compressed pods, are small, and of a kidney shape. There is a variety with white blossoms, and another with variegated leaves; there is also the *Spartium junceum*, or Spanish Broom, with single and double flowers, but this latter species is not sufficiently hardy to support the winters of this latitude, though it would suit the climate of North Carolina, and south of it *Prince's Horticulture.*

Althæa frutex or Hibiscus syriacus.—This shrub grows generally to the height of 10 or 12 feet; but there are some on Long Island which are at least 15 feet in height. It forms a fine conical shaped head, and the different varieties continue blooming from the latter part of summer to the end of autumn. The single flowering ones commence earliest in the season, and when they are nearly past, the double ones commence, and continue till frost prevents the further expansion of their flowers. There are a number of varieties, among which are two new double ones, originated from seed within the last few years.—*Ibid.*

Improvement of Morals.—A gentleman at Havana states, that murders in that city are becoming very rare, not more than two a week having been perpetrated during the last year.

Jamaica.—The sugar crop has commenced, and a luxuriant harvest was anticipated; but the coffee plantations yielded very short of their usual supply.

PEACH TREES.

(Concluded from page 339.)

Mr Thomas Coulter, of Bedford county, Pennsylvania, gives the following directions for cultivating peach trees, which he has successfully pursued in Pennsylvania and Delaware, for 45 years. See *Trans. Amer. Phil. Soc.* vol. v.

"The principal causes of peach trees dying whilst young, are the planting, transplanting and pruning the same stock; which causes the stock to be open and tender, and the bark of the tree very rough: this roughness of the bark gives opportunities to insects to lodge and breed in it; and birds search after these insects, for their support; and with their sharp bills, wound the stock in many places: from which wound the sap of the tree is drawn out, which congeals and never fails to kill, or to render the tree useless to a few years. To prevent which, transplant your peach-trees, as young as possible, where you mean them to stand; if, in the kernel, so much the better, because, in that case, there will be no check of growth, which always injures peach-trees. Plant peach trees, 16 feet apart, both ways, except you would wish to take your wagon through the orchard to carry the peaches away; in that case, give 21 feet distance to every fifth row, one way, after transplanting. You may plough and harrow amongst your peach-trees, for two years, paying no regard to wounding or tearing them, so that you do not take them up by the roots. In the month of March or April, in the third year after transplanting, cut them all off by the ground: plough and harrow amongst them as before, taking special care not to wound or tear them in the smallest degree, letting all the sprouts or scions grow that will grow; cut none away, supposing six or more should come from the old stump; the young scions will grow up to bearing trees on account of the roots being strong. Let no kind of beasts into peach orchards, *hogs excepted*, for fear of wounding the trees; as the least wound will greatly injure the tree, by draining away that substance which is the life thereof, although the tree may live many years, the produce is not so great, neither is the fruit so good. After the old stock is cut away, the third year after transplanting, the sprouts or scions will grow up, all round the old stump, from four to six in number: no more will come to maturity, than the old stump can support and nourish; the remainder will die before ever they bear fruit. These may be cut away, taking care not to wound any part of any stock, or the bark. The sprouts growing all round the old stump, when loaded with fruit, will bend and rest on the ground in every direction, without injuring any of them, for many years, all of them being rooted in the ground, as though they had been planted. The stocks will remain tough, and the bark smooth, for 20 years and upwards; if any of the sprouts or trees from the old stump should happen to split off, or die, cut them away, they will be supplied from the ground, by young trees, so that you will have trees from the same stump for 100 years, as I believe. I now have trees 36, 29, 19, 6, and down to one year old, all from the same stump. The young trees coming up, after any of the old trees split off or die, and are cut away, will bear fruit the second year; but this fruit will not ripen so easily as the fruit on the old trees from the same stem. Three years after the trees are cut off by the ground, they will be sufficiently large and bushy, to shade the

ground so as to prevent grass of any kind from matting or unding the surface, so as to injure the trees; therefore, ploughing is useless, as well as injurious; useless, because nothing can be raised, in the orchard, by reason the trees will shade all the ground, or nearly so; injurious, because either the roots, stock or branches will be wounded; neither is it necessary ever to manure peach-trees, as manured trees will always produce less and worse fruit, than trees that are not manured; although by manuring your peach-trees, they will grow larger, and look greener and thicker in the boughs, and cause a thicker shade, yet on them will grow very little fruit, and that little will be of a very bad kind, generally looking as green as the leaves, even when ripe, and later than those that never have been manured.*

"Peach trees never require a rich soil; the poorer the soil the better the fruit; a middling soil produces a more bountiful crop.

"The highest ground, and the north side of hills, is the best for peach trees; they keep back vegetation, by which means the fruit is often preserved from being killed, by the late frosts in the month of April, in the Pennsylvania latitude. I have made these observations from actual experience.

"A gentleman from Monongahela county, in Virginia, called at my house, and asked me who instructed me to cultivate peach-trees; I told him that observation and experience were my teachers. The gentleman observed that Col. Luther Martin, in the lower parts of Maryland, and another gentleman near the same place, whose name he could not recollect, were pursuing the same plan advantageously."

The propriety of transplanting trees, we have before explained.

The practice of Mr Coulter, in cutting down the trees is highly rational; they are thus forced to spend their vigor upon their bodies and roots, instead of shooting up into the air with thin barks, which are easily penetrated by the fly.

The best kind of peaches is said to be produced from inoculation; and upon an apricot stock, as they are not liable to be injured by the fly; and that peach-trees thus produced, grow larger and rise higher, than when on the peach stock.—Grafting the peach upon a plum stock, has also been practised, with a view of resisting the attack of the fly; but this operation must be performed under ground, otherwise an unsightly knob will be the consequence of the peach tree overgrowing the plum stock, and endanger the breaking off of the tree, at the place of junction.

The directions given by Forsyth, with respect to wall peach trees, may be applied to our standard trees, viz. "To pinch off all the strong stands in June, the first year the tree bears; which will make them throw out side shoots; these, if not laid too thick, will make fine bearing wood for the succeeding year. If the strong shoots be suffered to grow to their full length, they will be large and spongy, and will neither produce good fruit nor good wood for the following year. Sometimes weakly trees are covered with blossoms, but if too

much fruit be suffered to remain on them, they will be weakened so much that they will never recover. In that case, I would recommend picking off the greater part of the fruit to let the tree recover its strength. When trees in this state are pruned, never prune at a single flower bud; as the shoot will be either entirely killed, or at least die, as far as the next wood-bud.

"I have often topped the strong shoots twice in the course of a summer, before they produce the fine kind, bearing wood. These strong shoots exhaust the tree, and never produce good wood, when neglected to be topped. I would recommend to cut out such shoots when the trees are pruned in the spring, and to leave only the bearing wood, which may be known by two small leaves where the flower buds will be in the following year; (the strong shoots having only one leaf-bud at each eye) and to pick off all side-shoots near the tops of the branches, as soon as they can be laid hold of."

Peaches yield, on di-tillation, a highly flavored, but unwholesome spirit, which is much prized.—one or two spoonfuls, added to a bowl of common punch, greatly improves it. Indeed it is difficult to find a more agreeable assuager of thirst, than such a combination.

The flowers of peaches emit an agreeable, fragrant odour, and have a bitterish taste. If distilled in a water bath, they yield a whitish liquor, about one-sixth part of their weight, and which communicates to a large quantity of other liquids a flavor similar to that of the kernels themselves. An infusion of half an ounce of the fresh gathered flowers, or a drachm of them when dried, in half a pint of boiling water, sweetened with a little sugar, is said to be a useful laxative and vermifuge for children.—*Domestic Encyclopedia.*

Breeding of Maggots, &c.—Dr Mitchell states in the N. Y. Farmer, that the rearing and multiplication of maggots, for profit, is a regular business at the horse butcheries, near Paris. They are sold by measure, for feeding birds and poultry, and for fish bait. The man who superintends the maggot-breeding, pays to the owners of the slaughter house 30 francs (\$5,62) per week, for leave to carry on the trade!

Wool.—Mr Rapp, of Economy, Western Pennsylvania, offers for wool well washed on the sheep, as follows:—full blood merino 40 cents; seven eighths 35; three fourths 31; one half 27; common wool 22. It is doubtful whether the wool growers of New England will get higher prices than these the present season.—*Hamp. Gazette.*

The commissioners, who were appointed to inquire into the state of the Paris horse butcheries, reported that they had seen the flesh of fat horses so carefully ranged along the walls, that it would not have dishonored the best butcher's stalls; and they believed that much of it was consumed by the poor of the metropolis. They say that no doubt is entertained of its palatableness, healthiness, and nutritious qualities!—*Ibid.*

The editor of the Baltimore of Gazette acknowledges having received a sample of Liberian Coffee. It is pronounced to be not inferior to Mocha coffee, and superior to Java. It was gathered by the natives, and sold by the colonists at Liberia, for about three cents a pound. It is stated that coffee trees grow spontaneously at Liberia;—and that there are extensive forests of it there.

* This assertion is directly contrary to the experience of a gentleman in New Jersey, who has remarkably fine peaches, regularly manures his trees every year, and asserts that the speedy decay of common peach trees is owing chiefly to a neglect of the practice. He even said experience convinced him it was owing to the same circumstance, that peach-stocks did not, in general, produce fruit like the original tree."

PASTURE.

Some graziers mix a few sheep and one or two colts in each pasture, which both turn to account, and do little injury to the grazing cattle.—In some cases, sheep are of real benefit, by eating down and destroying ragwort, (*Senecio jacobaea*) which disgraces some of the best pastures where oxen are only grazed.

So various is the appetite of animals, that there is scarcely any plant which is not chosen by some, and left untouched by others. The following economical experiment is well known to the Dutch, that when eight cows have been in a pasture, and can no longer get nourishment, two horses will do very well there for some days, and when nothing is left for the horses, four sheep will live upon it; this not only proceeds from their differing in their choice of plants, but from the formation of their mouths, which are not equally adapted to lay hold of the grass.

New grass, stocked very hard with sheep, curbs the partial luxuriance of the seeds, and makes the grass unite and mat at the bottom, forming a tender and inviting herbage.

Alternately mowing and feeding land greatly improves it.

In Cardiganshire and Yorkshire, it is customary to put up their fields as early in May as they can, for the summer season, with no other attention than eradicating dock, or cutting down thistles, &c. In that state they continue till November or December, when all the stock is turned in, and every animal is in excellent condition, without the aid of hay, straw, or oats, and the butter is as good as in any part of the year. The frost sweetens the grass, and snow does not injure;—but while it is buried, dry food must be resorted to. In the spring of the year, young shoots of grass are very forward under the shelter of the old, and both together are eaten with avidity.—The land which was before mossy, from being overstocked and grazed too bare, is soon filled with palatable and abundant food, and the moss disappears without the aid of the plough, or surface manure.

In turning out horses to grass in the spring, it is usual to choose the forenoon of a fine day to do it in; the natural consequence is, the horse fills his belly during the sunshine, and lays down to rest in the cool of the night; and thereby, probably exposing himself to disorders. In some parts of Yorkshire a better practice prevails; the horse is turned out at bed time; the consequence is, he eats all night, and sleeps in the sunshine of the next day.

In Gloucestershire the best cheese is made from the coldest and least productive soils; over-run with rushes, &c. intermixed, however, with better herbage. And in North Wiltshire (famous for cheese) some dairymen mix sheep with the cows, to impoverish the pasture; in the proportion of about one sheep to a cow.

The bottom of an old hay stack is esteemed an excellent manure for pasture land, as besides the nourishment it affords, it contains a quantity of grass seeds, which furnishes a new set of plants. It should never be suffered to mix with manure for corn lands, as it will then raise grass and other plants, which, though of use in the pasture, are weeds among the corn.—*Gleanings in Husbandry.*

A society has been formed in Philadelphia, under the name of the "Horticultural Society of Pennsylvania."

HOP BEER.

For a half barrel of beer take half a pound of hops and half a gallon of molasses; the latter must be poured by itself into the cask. Boil the hops, adding to them a tea-cupful of powdered ginger, in about a pailful and a half of water, that is, a quantity sufficient to extract the virtue of the hops. When sufficiently brewed, put it up warm into the cask, shaking it well in order to mix it with the molasses. Then fill it up with water quite to the bung, which must be left open to allow it to work. You must be careful to keep it constantly filled up with water whenever it works over. When sufficiently wrought to be bottled, put about a spoonfull of molasses into each bottle.

PRESERVED STRAWBERRIES.

To one pound of ripe strawberries put one pound of powdered loaf sugar, laying alternately on a deep dish a layer of each. Let them remain thus for twenty-four hours, when boil them in a sirup till they are all of a color. In order to determine when they are done enough, cut one of them open. Then, taking them out, boil the sirup to the consistence of a jelly, let it remain till cool, then put in your strawberries, and let them boil up once, take them off, and when cool, put them into a pot for use.

The justly celebrated M. de Pradt, is now engaged in forming an experimental farm, as a school or practical husbandry for the central part of France. It is situated about a league from Allanches on the great road from that city to Bort, in the department Correze.

Magnetic needle.—Professor Eaton proposes that the needles of compasses should be tipped with silver, brass, &c. This not only preserves the points from rust, but withdraws the poles from any attractive power in the brass, whether it arises from hammering, or from any particle of steel or iron which may have been accidentally left in the brass.—*New Bedford Mercury.*

Hares.—During the past winter a number of gentlemen procured a large number of hares to be collected in the western counties, fifty of which have been brought down, and turned loose in different places on Long Island. It is a harmless animal, and does no injury to the farmer. It is therefore to be hoped that they may be suffered to increase and multiply for a little time. They are really game; they afford much fine sport for the lovers of hunting; and they are said by connoisseurs to be superior to the English hare, a brace of which costs a guinea in that country. They are more like the French hare, an article much esteemed by epicures. The meat is black as that of the deer, and is exceedingly delicate.—*Com. Advertiser.*

Meat may be preserved fresh many months, by keeping it immersed in molasses. A joint of meat or any provision, suspended in a flannel bag, will keep sweet much longer than by most of the modes commonly practised. The cooler and drier the meat is, when the flannel is put round it the better, and the flannel should be perfectly clean.

Carl Horse.—John Kane was tried, convicted, and sentenced to the penitentiary for six months, at hard labor, for unmercifully beating his horse. He is a gray headed man—63 years old.—*N. Y. Advertiser.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 23, 1828.

ORCHARD.

Soil. Any soil is suitable for an orchard, which produces good crops of grain, grass, or garden vegetables; but a good deep sandy loam not too dry nor very moist is to be preferred. In the stiliest part of the ground you may plant pear trees; in the lighter, apples, plums, and cherries, and in the lightest, peach, netarine, and apricots.

Aspect. A south eastern aspect is generally recommended; but when this exposes the trees to the sea winds, a south western may be better.—Some recommend a northern aspect, and planting trees the north side of a wall to prevent them from budding and blowing so early in the spring as to expose them to frosts.

Preparation of the ground. If the land be swarded it should be broken up and tilled at least one year before the trees are planted.

Manure. Rotten leaves, or the mould formed by the decomposition of leaves, is recommended by Forsyth. Compost, or rich earth, is said to be preferable to dung, which encourages insects and blight. McManon says, "it is well known that where hogs and poultry are constantly running over the ground, the trees seldom fail of a crop— which is the best proof that manure is necessary. Any manure will suit an orchard; but the sweepings of cow-houses, hog-pens, slaughter-houses, poultry and pigeon houses, emptying of drains, &c. are more disposed to facilitate the growth of fruit trees than stable manure. However, any kind of manure is better than none at all."—Hog dung is accounted to have a peculiar virtue in invigorating weak trees. Rotten turf, or any vegetable refuse, is a general manure—excellent for soils, not already too rich. For an exhausted soil, where a fruit tree, which has been an old profitable occupant is wished to be continued, a dressing of animal matter is a powerful restorative, such as hog's or bullock's blood, effal from the slaughter house refuse of skins and leather, decomposed carrion; also urine diluted with water. In a soil which does not effervesce with acids, a little lime, dug in a spade deep is beneficial to fruit trees.—*Abercrombie.*

Distance of trees in an orchard. It should be considered at the time of planting to what size the trees are likely to grow. And they should be set so far asunder that their limbs will not be likely to interfere with each other, when they arrive at full growth. In a soil that suits them best they will become largest. Twenty-five feet may be the right distance in some soils; but thirty-five feet will not be too much in the best, or even forty.—*Deane.*

Cropping. It is proper to crop the ground among newly planted orchard trees, for a few years, in order to defray the expense of hoeing and cultivating it; which should be done until the temporary plants are removed, and the whole be sown down to grass. But it is by no means advisable to carry the system of cropping with vegetables to such an excess as is frequently done. If the bare expense of cultivating the ground, and the rent, be paid by such cropping, it should be considered enough. As the trees begin to produce fruit, begin also to relinquish cropping. When by their productions they defray all expenses, crop no longer. I consider these as being wholesome rules, both for the trees and their owners.—*Londor.*

Orchards which are laid down to grass last long-est; but it is necessary to keep the ground clear of weeds and grass for some little distance from the roots. They may be pastured with calves and swine, and by the latter with much advantage, as they destroy the curculio. Sheep may be admitted, provided the trees are smeared with a coat of lime, or with Forsyth's composition; but large cattle, which can reach up to the limbs of the trees should not be suffered to run in an orchard. In Germany they surround the roots of fruit trees in grass land, with hemp breakings, not only the stock, but for some distance from the tree. The breakings of flax, and spent tan are also recommended for the same purpose.

TO PURIFY MUSTY CIDER.

A friend informs us that a few slices of the red beet, put into a barrel of musty cider will deprive it of its disagreeable taste and smell, as well as prevent its becoming rapid or acid.

CUCUMBERS

Are rendered more wholesome by slicing them into a basin of cool spring water.

SAGE CHEESE.

To make sage cheese, take the tops of young red sage, and having pressed the juice from them by beating in a mortar, do the same with the leaves of spinach, and then mix the two juices together. After putting the rennet to the milk, pour in some of this juice, regulating the quantity by the degree of color and taste it is intended to give the cheese. As the curd appears, break it gently, and in an equal manner, then emptying it into the cheese vat, let it be a little pressed in order to eat mellow. Having stood for about seven hours, salt and turn it daily for four or five weeks, then it will be fit for the table. The spinach besides improving the flavor and correcting the bitterness of the sage, will give it a much more pleasing color than can be obtained from sage alone.

ON THE CULTIVATION AND USES OF TREES, TIMBER, &c.

Every farm of any considerable size should have a wood lot, to afford a supply of fuel and timber. That part of a farm should be devoted to this purpose, which is least adapted by nature to tillage or grass. Land which is swampy, with a very thin soil over a sandy bottom; land that is rocky and mountainous, or which will not endure drought, may answer well for forest trees. It is very bad policy to suffer any such places to be destitute of growing trees.

Some farmers in this country, have thought they would make a lot of ten or a dozen acres answer the purpose of supporting one constant kitchen fire. This, however, is thought by good judges to be too small a quantity of land for that purpose, unless it be very fertile.

In France, large forests were carefully preserved, even during the wildest periods of the revolution, when almost every thing else was abandoned to destruction. It is said to be the practice of the French people not to cut off their woods oftener than once in twenty or twenty five years, and by law, when they are cut over, the owner is obliged to cut all *smoothly*, with the exception of a very few trees, which the officers of government had marked to be spared for a larger growth. And when woodlands are cut they always ought to be cut

smooth, if it is wished that the timber may be reproduced, that the new growth may start together, and not be shaded by trees of a larger growth.—Selecting now and then a large tree, destroying a number of trees in order to obtain access to it, and felling it in such a manner as to injure and break down many others is a wasteful practice, which is insufferable where wood or timber possesses any value.

But it is not merely in forests, nor as supplying fire wood and timber that trees are valuable.—“Considered agriculturally,” says an English writer, “the advantages to be derived from subdividing extensive tracts of country by plantations are evidently great, whether considered in the light of affording immediate shelter to the lands, or in that of improving the local climate.” The fact that the climate may be thus improved, has in very many instances been sufficiently established. It is indeed astonishing, how much better cattle thrive in fields even but moderately sheltered, than they do in an open exposed country. In the breeding of cattle, a sheltered farm or sheltered corner in a farm, is a thing much prized; and in instances where fields were taken by the season for the purpose of fattening them, those most sheltered never fail to bring the highest rents, provided the soil be equally good with that of the neighboring fields, which are sheltered by trees. If we inquire into the cause, we shall find that it does not altogether depend on an early rise of grass, on account of the shelter afforded to the lands by the plantation; but, likewise, that cattle, which have in their power, in cold seasons, to indulge in the kindly shelter afforded them by trees, feed better; because their bodies are not pierced by the keen winds of spring and autumn; neither is the tender grass destroyed by the frosty blasts of March and April.

Dr. Deane observed, “to manage pasture land advantageously, it should be well fenced in small lots, of four, eight or twelve acres, according to the largeness of one's farm and stock. And these lots should be bordered at least with rows of trees. It is best that trees, of some kind or other should be growing scattered in every point of a pasture, so that the cattle may never have far to go in a hot hour to obtain a comfortable shade. The grass will spring earlier in lots that are thus sheltered, and they will bear drought the better. But too great a proportion of shade should be avoided as it will give a sourness to the grass.

Small lots, that are thus sheltered, are not left bare of snow so early in the spring as larger ones lying bare, as fences and trees cause more of it to remain upon the ground. The cold winds in March and April hurt the grass much when the ground is bare. And the winds in winter will not suffer snow to lie deep in land that is too open to the rake of winds and storms.” (To be continued.)

MINES, COAL, &c.

Modern discoveries in geology have thrown great light on the subject of mining, and introduced into the art a degree of certainty never before contemplated. No saline, or metalliferous bodies, however, ought to be sought for or attempted to be worked, but with the advice and assistance of an experienced and skillful mineral surveyor. Nothing being more common than for proprietors to be induced by local reports or traditions to fancy their lands contain coal, lead, or some other valu-

able subterraneous products, and to incur great expense in making abortive trials.

There are certain indications, which point out the existence of metals, coal, &c. and to search for them where such indications are not present is as foolish as it would be to look for tropical fruits in Greenland. Dr. Cooper, in the last Philadelphia edition of Willich's Domestic Encyclopedia makes the following observations on this subject:

“Indications of coal. It is hardly possible to give any useful notions on this subject to persons who have paid no attention to geology, or subterranean geography. But it may be observed briefly,

1. It is hopeless to search for coal mines in a primitive country, that is, in the strata called granite, gneiss, mica, slate, soapstone, clay slate, or syenite. Sometimes powerful floods or some other cause may have washed away and denuded some of the intermediate strata between granite and coal, as at Richmond, Virginia; but these are rare and anomalous cases. 2. The class of rocks called transition, such as granwacke, and granwacke slate, often contain anthracite, glanz, or smokeless coal; as in Schuylkill and Luzerne counties, Pennsylvania. 3. The class of rocks called secondary or horizontal, contain almost all the known coal basins. Every coal field, or coal basin in what is called geologically the independent coal formation, consists of a separate series of irregularly elliptical strata, dipping from the out break or crop toward the centre of the basin.—These are found below the stratum called in England the floetz magnesian limestone, and usually extend downward toward the mountain or Derbyshire limestone, which rests on the old red sand stone. A coal field consists of various strata of slate, clay, or shal at the top, containing pyrites and vegetable impressions of ferns, pines, bamboos, &c. then coal, then argillaceous gravelly or freestone strata, then coal, then argillaceous gravelly, and freestone strata, often alternating with basalt, or wid or toadstone, then coal again and so on. 4. The great coal beds (coal strata or coal measures) that constitute the independent coal formation, are above the mass of rock salt, and the strata connected with it. 5. The lignite or coal, half wood, half coal, is never to be relied on as an indication of profitable coal strata. 6. In searching for coal, attend to the impressions of organic fossils.—There are no animal remains except very rarely land muscles in coal strata; there are no vegetable impressions in the strata above or below; (except in the transition anthracite, very far below the bituminous coal. 7. The slate clay over coal is often blackened by the bituminous soot of coal beneath, and contains pyrites. 8. In searching for coal, examine in streams, gullies, and ravines, the edges of the strata; remark if they consist of the strata usually accompanying coal, and trace them upward, to where they crop out, or break out to the day.”

LATEST FROM EUROPE.

London files on the 20th of April have been received, by which it appears that a powerful Russian army had passed on and was about to pass into the Turkish domains at Moldavia, with the intention of taking possession of that province and of Wallachia. Although no positive declaration of war had been issued by the Russian government, yet official articles wore a hostile appearance—showed a determination to invade the Turkish territories, and indicated that Russia was certain of the

countenance of the European powers in this decisive measure.

In France all was quiet, and the army in Spain was on the march home. The British Parliament was in session, and the committee on Retrenchment had nearly finished its labors. A bill from the Commons to repeal the Sacramental Test and Conformation acts, had passed to a second reading in the House of Lords.

BOSTON HARBOR, &c.

The Mayor of Boston has received a letter from the Hon. Daniel Webster, dated Washington, May 16th, by which it appears "that a bill originating in the House of Representatives, and passed to a third reading in the Senate, by which the sum of eighty-seven thousand dollars is appropriated for the preservation of Deer Island, in Boston harbor."

On Tuesday we noticed in a garden in this town, that many of the vegetables, such as beets, onions, &c. had made their appearance in such plenty as to encourage the expectation of a large and early crop. Strawberries will be scarce. The prospect for stone fruit is good. Of the prospect for apples, pears, &c. we have not had sufficient opportunity to judge whether they will be plenty or not.—We must enjoin upon the farmers in this vicinity the necessity of devoting more attention to the growing of fruit trees. They need no stronger argument to convince them of its expedience than is derived from the high price at which fruit of all kinds is sold in this place.—*Lowell Journal.*

Stomach of the Horse.—It is popularly known that a horse cannot be made to vomit. This owing to one half of the stomach being covered by an insensible cuticle, and when an emetic substance is exhibited, the food is thrown upon this part of the stomach, and remains there. It is attempted however, was once successful; but it cost the animal its life—the stomach being burst by the violence of its efforts.—*London Weekly Review.*

For preserving Cucumbers.—Place them in a tub, and pour upon them fresh water, boiling hot; pour the water off when cold, and repeat the process of scalding. After the water is cold and poured off the second time, pour upon them boiling vinegar, and let the whole remain for after use; when the cucumbers will be found fine, crispy, and of the finest green.

Annual Militia Force.—On Tuesday was performed in this town the first act of the military drama of 1823. The play exhibited many of the characteristics of high and low comedy, but on the whole must be regarded as a miserable farce. The actors were the industrious operatives, farmers, &c. of the town, who were compelled by an iniquitous and oppressive law, to leave their daily avocations, and "strut the soldier," to no advantage to themselves, and none to the nation.—Our independent companies always make a martial appearance, and well deserved the compliment that is often bestowed upon them for their expertness in military evolutions. Of the soldiers in the military companies we have not much to say, except that there was a parent a soldierly variety in dress, and that kind of reluctance in marching which is observable in the step of some men when they ascend a ladder for the last time. Such is the natural effect of an unrighteous law, which exempts one part of the community from the slavish drudgery of military duty, and compels the other to perform it. The burden falls upon the least able to bear it. The tax is the same whether it is to be paid by the man worth millions, or by him on whose daily labour a family is dependent for support. There may be justice in the requirement of the law, but if so, we have not the faculty to discern it.

The company which attracted the most notice was that commanded by Capt. Rane, and consisted of about forty Green Mountain boys, armed with shovels, spades, picks, &c.—some are employed in digging a canal, and whose appearance must have convinced any one, that if called into action they could "turn the earth upside down" to some purpose.—*Lowell Journal.*

New Agricultural Books.

Just received at the New England Farmer Seed Store, from London, a further supply of standard works on agriculture, horticulture and floriculture, of the latest editions; among which are:

An Encyclopedia of Gardening; comprising the Theory and Practice of Horticulture, Floriculture, Arborescence and Landscape Gardening, including all the latest Improvements; A General History of Gardening in all Countries; and a statistical view of its present state, with Suggestions for its Future Progress, in the British Isles. By J. C. Loudon, F.L.S., H.S., &c. Illustrated with many hundred Engravings on wood, by Braunton. Fifth Edition.

An Encyclopedia of Agriculture; comprising the Theory and Practice of the Valuation, Fertilizer, Laying Out, Improvement, and Management of Landed Property; and the cultivation and economy of the Animal and Vegetable Productions of Agriculture, including all the latest Improvements; A General History of Agriculture in all Countries; and a statistical view. Its present state, with suggestions for its future progress in the British Isles. By J. C. Loudon, F.L.S., H.S., &c. Author of the Encyclopedia of Gardening. Illustrated with upwards of eight hundred Engravings on wood, by Braunton.

The Science of Agriculture, comprising a practical system for the Management and Training of Fruit-Trees, exemplified by sketches from trees actually trained. Also a Comparative Investigation of the Foundation and Application of the Physiological Principles of Mr Kirwan, Sir Humphry Davy, Mrs. Robinson, and Messrs. Hill, Forsyth, and Knight. Second Edition, with Additions. are added, an Essay on the Cultivation of the Pine-Apple, describing and exemplifying, by sketches an Improved Arrangement for furnishing every necessary Degree of Heat by Steam, and of applying it to every required Purpose, the results of a course of experiments in growing Peaches and Nectarines, in pots, in a conservatory. By Joseph Hayward. Second Edition.

On the Gæstesia, or the Portable Flower-Garden; with directions for the Treatment of Plants in Pots; and Illustrations from the Works of the Poets. Second edition, with additions.

The Fruit Grower's Instructor; or, a Practical Treatise on the Cultivation and Treatment of Fruit Trees, containing a description of the Apple Fly, commonly called the American Blight, which causes the canker in Apple Trees, with an Effectual Remedy. By J. Bliss.

A Treatise on the Improved Culture of the Strawberry, Raspberry, Gooseberry, and Currant; in which are pointed out the best methods of obtaining ample crops of these fruits. To which are prefixed Descriptions of the most esteemed Varieties. Third edition, with coloured plates. By Thomas Haynes.

The Green House Companion; comprising a general course of Green-House and Conservatory Practice throughout the year; a Natural Arrangement of all the Green-House Plants in cultivation; with a descriptive catalogue of the most desirable to form a collection, their proper soils, modes of propagation, management, and references to botanical works in which they are described. Also, the proper treatment of flowers in rooms, and bulbs in water glasses. Second edition.

A Treatise on the culture and management of Fruit Trees; in which a new method of pruning and Training is fully described. To which is added, a new and improved edition of "Observations on the Diseases, Defects, and Injuries, in all kinds of Fruit and Forest Trees," upon an account of a Particular Method of Cure, published by order of government. By William Forsyth, F.R.S. and F.R.S.A., gardener to his Majesty at Kensington and St. James's, Member of the Economical Society at St. Petersburg, &c. &c. The seventh edition, corrected, with additions of new Fruits, and references to their figures; also a calendarial index.

The Florist's Directory; a Treatise on the Culture of Flowers, to which is added, a Supplementary Dissertation on Soils, Manures, &c. By James Mallock, Florist. A new edition, improved; with notes, and an appendix on the Culture of the Dahlia, Chrysanthemum, Lulchella, and Free Mignonette. By Samuel Curtis, Editor of Lectures on Botany, &c.

Horas Gramineæ Væ Cruciferae; or, an Account of the Results of Experiments on the Food and Nutritive Qualities of different Grasses and other Plants used as the food of the more valuable domestic animals. Instituted by John, Duke of Bedford. Illustrated with numerous figures on the plants and seeds upon which these experiments have been made, and practical observations on their natural habits, and the soils best adapted to their growth; pointing out the kinds most profitable for permanent pasture, irrigated meadows, dry or upland pasture, and the alternate husbandry; accompanied with the Discriminating Characters of the Species and Varieties. By George Sinclair, F.L.S. F.H.S. Third edition.

Sweet's Hortus Britannicus; or, a Catalogue of Plants cultivated in the gardens of Great Britain; arranged in natural order.

A Concise and Practical Treatise on the Growth and Culture of the Carnation, Pink, Auricula, Polyanthus, Ranunculus, To-pip, Hyacinth, Rose, and other flowers; including a Dissertation on Soils and Manures, and containing catalogues of the most esteemed varieties of each flower. By Thomas Hogg, Florist. Third edition.

Elements of Agricultural Chemistry, in a Course of Lectures for the Board of Agriculture. By Sir Humphry Davy, Bart. Pres. R.S. &c. Fourth edition.

An Easy Introduction to the Science of Botany, through the medium of Familiar Conversations between a Father and his Son. By Robert John Thoreson, B.D. New Observations on the Natural History of Bees. By Francis Huber. Third edition. Illustrated by five Plates.

A Practical Treatise on Breeding, Rearing, and Fattening all kinds of Domestic Poultry, Pheasants, Pigeons, and Rabbits. Also instructions for the Private Brewery; By Benjamin Moubray, Esq. Fifth edition.

Also, this day received from New York, a Short Treatise on Horticulture; containing descriptions of a great variety of Fruit and Ornamental Trees and Shrubs—Grape Vines—Rubbish Flowers—Green-House Trees, and Plants, &c. Directions for Culture, Management, &c. By Miss France. Price \$1.

Also, a Treatise on the Cultivation of Ornamental Flowers; comprising Remarks on the respective Soil, Sowing, Training, planting, and general Management, with Directions for the general treatment of Bulbous Flower Roots, Green-House Plants, &c. By Roland Green. Price 5s. 6s.

Likewise, just received from New York, a Treatise on the Kitchen-garden, the Orchard, and Vinery; with plain practical Directions for management. By William Watson, Nurseryman. Price 75 cts.

Also, "Seventy-five Receipts for Pastry, Cakes, and Sweetmeats. By a Lady of Philadelphia." Price 50 cts.

Green-House Plants.

There will be sold at auction, in Salem, in the course of the ensuing week, upwards of 200 pots of rare and beautiful Green-House Plants, from the famous Garden, New York. Among which are the Grenville Tree, Coffee, Pepper, several varieties of the *Mimosa* or Sensitive Plant, &c. Catalogues can be had in Boston at the New England Farmer Seed Store, where any directions respecting purchases can be left by those who may not find it convenient to attend. Salem, May 21.

Tarragon Roots.

For sale at the New England Farmer Seed Store, a few roots of this herb, (growing in pots,) used in soups, salads, &c. price 50 cts. per pot. Likewise roots of the Chives, in pots, price 1s. 42 cts. per pot.

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in seeds of six and a quarter cents each; likewise done up in packages comprising 24 varieties, each sort being labelled, at \$1 per package.

MISCELLANIES.

TO THE DEITY.

FATHER SUPREME! O let me climb
That sacred seat, and mark sublime
Th' essential source of life and love;
Fount, whence each good, each pleasure flows
O, to my view thus! I disclose!
The radiant heaven thy presence throws!
O, lose me in the light above.

Flie, flee, ye miss! let earth depart;
Raise me, and show me what thou art,
Great sun and centre of the soul!
To thee each thought, in silence, tends;
To thee the saint, in prayer, ascends;
Thou art the source, the guide, the goal.
The whole is there, and thou the whole.

FOR THE NEW ENGLAND FARMER.

Social intercourse. In the intercourse of society, a man always receives according as he gives; and as he treats others so is he treated himself.—If he wishes to be dealt with honestly, he must be honest; and if he wishes to be respected by respectable people, he must treat them with respect.

Politeness may be considered the ornament or polish of morals or manners. "Civility is a sort of current coin, which costs nothing and buys every thing." The greatest genius and the most splendid talents will not compensate the want of good manners, good sense, and a good address. To be polite, with permanent advantage, it is necessary to be sincere; and he who always exhibits a cringing acquiescence in the opinions of others, will be eventually despised as a hypocrite, time-server, and sycophant. But in order to be sincere, it is not requisite that we should always criticize, rail at, or find fault with men and things which may happen not to meet our approbation. Sometimes we may do as much injury to the feelings and interests of those with whom we have intercourse by uttering unnecessary and disagreeable truths, as we could by almost any falsehood which could be prompted by malice or invented by unprincipled ingenuity.

Conversation. An essential part of politeness is agreeable conversation, and taking part in the current amusements of the time and place. The art of conversation is only to be acquired by reflection and experience. The first is to store the mind with ideas on every subject by reading and observation, acquiring a stock of information relative to anecdote, history, and biography; the next thing is to adopt our conversation to the society in which we happen to be; and the last requisite is to endeavor to discover the precise part and quantity of conversation which he ought to supply.

Fish Stories.—Incidents, of a nature somewhat calculated to excite marvel, frequently occur among our Cape Horn friends, as they traverse the "illimitable sea," in pursuit of spermaceti and whale bone. One or two that have come to our knowledge we will relate. A large female whale was tackled by two of our ship masters, on the off shore ground, in some part of the Pacific. The tow iron breaking, the whale made its escape. Eleven months afterwards, the same whale, with the broken iron in its body was captured by one of the captains here alluded to, at a distance of

eighteen hundred miles from the place where it was first seen.

Some years ago, in Woolwich bay, (Coast of Africa, a young whale came along side one of the boats belonging to a whaling ship; whereupon, one of the men in the boat marked the initials of his name on its back, and then let it go. Several years after, the identical whale itself, bearing the seaman's initials, was taken on the Brazil Bank—and produced 60 barrels of oil.—*Nantucket In.*

The stump-tailed cow.—A good many years ago, a man stole a cow from Morristown, (New Jersey) and drove her to Philadelphia for sale. She was a common cow enough, except that she had lost her tail but about six inches. The thief, fearing that by the shortness of her tail he might be traced, had procured in some way, (probably from a slaughter-house) another cow's tail, which he fastened so ingeniously to the short tail that it was not to be known that it had not regularly grown there. As soon as the Jerseyman missed his cow, he set off for Philadelphia, thinking she would probably be carried there for sale; and it happened that when he came to the ferry he got into the same boat that was carrying over his cow, and the fellow who stole her. As it was natural that he should have his thoughts very much upon cows, he soon began to look at this one with very great attention. She was indeed, *very much* like his cow, he thought. Her marks agreed wonderfully, and she had exactly the same expression of face; but then the appearance of her tail was so very different. It must be supposed that the new owner of the cow felt rather uncomfortable during this examination, for he soon saw that this was the person whose property he had stolen, and he was very uneasy lest he should take hold of the tail, which he looked at so continually. Upon the whole, he thought it best to divert his attention in some way, if possible, and therefore steps up to him and says, "Neighbor, that is a fine cow of mine, won't you buy her? you seem to know what a good cow is."—"Oh, dear me," says the other, "I've just had a cow stolen from me."—"Well," says the thief, "I'm sorry to hear that they've got to stealing cattle, but I'll sell off, and you could not better replace your loss than by buying this cow, I'll warrant she's as good as yours."—"Why," says the Jerseyman, "she was exactly like this one, only that she had no tail to speak of—and if this one had not such a long tail, I'd swear it was my cow." Every body now began to look at the cow's tail, but the thief stood nearer to it than any body, and taking hold of it so as just to cover the splicing with his left hand, and with a jack-knife in his right, pointing to the tail, he said—"So if this cow's tail were only this long, you'd swear she was yours?"—"That I would," says the other, who began to be very much confused at the perfect resemblance to his cow, except in this one particular; when the thief, with a sudden cut of the knife took off the tail, just about an inch above the splicing, and throwing it overboard, bloody as it was, turned to the other and said, "Now swear its your cow! The bewilderment of the poor man was now complete; and as he had seen the tail cut off, and saw the blood trickling from it, he could of course, lay no claim to the animal from the shortness of her tail. Indeed, here was proof positive, that this was not his cow; so the thief, going over with him, sold the cow without any further fear of detection.

A Conscientious Apothecary.—It has been said that apothecaries have no conscience; but here is an instance to the contrary. In the Court of Common Pleas, Dublin, a person came forward to qualify for going bail to a writ issued for £20.—Mr. O'Connell inquired what profession he was of? He answered an apothecary. By virtue of your oath, said Mr. O'Connell, is your stock in trade of the value of £20? Galen hesitated for some time, but at length said, "I think I shall be able to make five hundred pounds out of it."

Teeth Anecdote.—A Lady said to a Physician who had grand children—"How do you manage, Doctor, to have such a set of firm white teeth at your age?" "Why Madam, by the same means that I keep my feet clean."—"And how is that, Sir?" "By washing them frequently." "But why wash your feet frequently, they are not seen, but covered with shoes and stockings." "Because, Madam, every neat person must feel clean, as well as appear so—and those who have foul teeth can never enjoy that luxury."—*N. E. Galaxy.*

IMITATION OF SERBIAN POETRY

The maiden turned her head away—
"You'll have no kiss from me to-day;"
"And why, to-day, love, must I see
"The roses bloom, and not for me?"
Tears filled the maiden's raven eyes—
"The lighty won, you lighty prize;
To make you prize the kiss you gain.
It must be won with toil and pain;
And seldom too; so still I say,
You'll have no kiss from me to-day."

Too late I staid, forgive the crime:
Unleaved flew the hours;
For no-less falls the foot of time,
That only treads on flowers.

Oh, who with clear account remarks
The ebbing of his glass,
When all its sands are diamond sparks,
That dazzle as they pass.

And who to soother measurement,
Time's happy swiftmess brings,
When birds of paradise have lent
Their plumage to his wings.

"Harry, I cannot think," says Dick,
"What makes my *anels* grow so thick;"
"You do not recollect," said Harry,
"How great a *colf* they have to carry."

ROMAN.

A very elegant, full blooded horse, imported with a hope of improving the breed, will stand this season at the farm of Mr. Stephen Williams, in Northborough, county of Worcester.

Roman was purchased in England of the Earl of Warwick—and his pedigree has been traced in the New Market Studbook from Childers, the swiftest horse that ever ran over New Market course, through eight generations of the highest bred horses, and mares in England, without a single cross of inferior blood. At 4 years old he won five, and at 5 years old he won four prizes, and has since beat some of the fleetest horses in England over the most celebrated courses.

His colour a very bright bay—black legs, mane, and tail—walks and trots well—is very good tempered—high spirited—swift—full bitten and a half blood high, and is considered by judges as handsome and well formed a horse as can be found in the country.

Mares have been sent to him from all the New England States, as well as from the remote counties in this State and the neighboring towns, and his colts are handsome and command high prices.

Terms, \$20 the season, to be paid before the mares are taken away. Northborough, May 16, 1828.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days, from the time of subscribing, are entitled to a deduction of fifty cents.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

SILK.

MR FESSENDEN.—The measures adopted by the Federal government, to encourage the introduction of the culture of silk in the United States, have excited universal attention and interest, especially among the well informed and most intelligent part of the community, from a well founded hope of the ultimate success which may be expected in the undertaking. It is probable therefore that the exhibition of a few skeins of the most esteemed silk of Italy, would prove generally agreeable at the present time, to our fellow citizens, and that ocular demonstration, being thus added, to the description often given in the public prints, of the richness and beauty of this article, it would have a useful and encouraging tendency. Allow me, then, to transmit you herewith, for the purpose above mentioned, skein samples of the following silks.

1. a white Novi raw Silk of 4-4 cocoons.
2. a Fossombrone do. Sublima.
3. a do. do. of second sort.
4. a Pesaro do. superfine.
5. a Bologna do. of first sort.
6. a do. do. of second sort.
7. a Friuli do. of first sort.
8. a do. do. of second sort.
9. a Rimini do.
10. a Milan do. superfine.
11. a do. do. of 5-6 cocoons
12. a Bengal raw Silk of the English East India Company, of the filature of Cossembar, quality B.
13. a do. as above, filature of Commercolly, quality B.
14. a do. filature of Gonnatec, quality B.
15. an Organzine of Piedmont, filature of Cerie, fineness of 24d.
16. a do. filature of Raconis, fineness of 27-28d.
17. a do. filature of Sacerdoti, fineness of 30d.
18. a do. filature of Pero, fineness of 34-36.
19. an Organzine of Bergam, of the home filature of Antonio & Fratelli Sozzi.
20. a do. of the home filature of Gio: Batta: Maffei.
21. an Organzine of Bergam of first sort.
22. a do. of second sort.
23. an Organzine of Milan, of the quality of 26-28d.
24. a do. do. do. 34-36d.
25. a do. of Bresica, superfine.
26. a do. of Milan, of second sort.

The raw silks are such, as are wound from the cocoons immediately after the worms have done spinning. In the filatures, they wind from 4 to 14 cocoons into one thread more or less according to the quality of the silk they wish to make: the natural gum of the silk makes the threads unite and adhere so completely, as they come out of the hot water wherein they are immersed at the time of winding, that they become one single thread, and are not to be again separated. The excellence of a raw silk, depends not only upon its fineness, but also upon its being perfectly even and clean. If

an additional or more cocoons are introduced occasionally to the process of winding, the silk is thereby rendered uneven; if care is not taken, whilst winding, to keep the thread clear and free of the burr and of the floss of the cocoon, the silk is thereby rendered foul; those imperfections will reduce considerably the value of the article.

In Piedmont the great perfection of their raw silks renders them so eminently adapted for organzines, that they seldom, if ever, export them to foreign markets they work them into organzines, and thereby increase the original value of the silk from thirty to fifty per cent.

An organzine, which is also denominated thrown silk, is made by twisting two threads of raw silk together, at the same time that each thread receives a separate twist by itself: this is performed by machinery of ingenious complex, and costly construction, set in motion by water power. The beauty of the organzine consists in being made of silk prime in its kind, and in having its twist performed in a perfect stile of evenness; the manufacture of certain goods requires a harder twist than others, and much depends also upon the habits and ideas of the manufacturers. Generally speaking, the manufacturers of Lyons require organzines of a much harder twist than those of Lomani, and in both countries, the ribbon manufactory requires the hardest twist of any.

The fineness of an organzine is determined by weighing a certain number of yards, the weight is the denomination of its quality; there are machines so constructed, that after placing the organzine of a winder, the machine will wind the fixed number of yards and stop. I transmit you herewith a list of the filatures of Piedmont in the year 1783, with the names of the proprietors, and the number of bales which they manufactured yearly; it cannot be a matter of general interest, but may be, perhaps, an object of curiosity with some of your readers, and might be deposited with the samples for their inspection. In all the districts of Italy where the raw silks, and the organzines, are made with care, they bear precise and determined appellations: thus the raw silks are styled, according to the number of cocoons wound together; viz. 4 4 cocoons, which mean a thread wound all the time with four cocoons; or 5-6 cocoons, that is, varying occasionally one cocoon, when the natural unevenness of the thread makes it needful to introduce into play one additional cocoon to preserve the evenness of the silk; this requires great nicety, practice and judgement on the part of the winders, who are always women. These correct denominations are altogether in practice in Piedmont. Further south in Italy, the people are less intelligent, less careful, and their denominations are vague; thus they use to distinguish their various qualities by the appellations of superfine, fine, first and second sorts, which have no precise meaning; in the same bale one skein varies from another, and in the same skein the thread runs uneven, sometimes to an extreme.—Such silks, which constitute a considerable portion of the produce of Italy, are unfit for the manufacture of the best piece goods.

Having thus endeavored to explain, in some measure, the nature of the Raw Silks and organ-

zines, I shall now make some reference to the sample skeins, which are under our consideration: and first, I wish to point out skein No. 1, being a white raw silk of Novi, of the extreme fineness of 4 cocoons; there is but a small quantity of such silk made, it is beautiful and perfect, is generally white, and is not to be surpassed, nor even equalled, I believe, by any other, either in Italy or elsewhere; the worms are apt to spin promiscuously white and yellow cocoons, although the much greater number are yellow, but a constant attention to select white cocoons for seed, will after a time, procure a majority of that colour, which is valued for certain goods, which require a very clear and perfect colour. The skein next in fineness is No. 2. Fossombrone sublima, these are very fine and beautiful silks, but not to be compared for perfection, evenness, cleanness, &c. to the Novi; when the Novi sold in the London market for 33 shillings sterling per pound of sixteen ounces, the best Fossombrone was not worth more than 36 for the pound of twenty four ounces. The Pesaro No. 4, is made in a neighboring village to Fossombrone, but their silks are always fifteen per cent, at least inferior. The Friuli Nos. 7 and 8, deserve to be pointed out as silks of peculiar elasticity and fineness: they are made in the mountainous parts of the state of Venice, and have been always much esteemed for the gauze manufactory.

The Bologna silks, Nos. 5 and 6, are of much merit and superior to the Milan Nos. 10 & 11, and Rimini No. 9, in point of evenness and cleanness. The organzine No. 15, being of the filature of Cerie, and of the title of 24d. is about as fine as any generally made in Piedmont, or any other country, altho' a few bales are made occasionally as fine as 20 and 23d. The title of 27-28d. filature of Raconis, No. 16, is a fineness much used, and it is seldom that any manufacture requires finer; the evenness of thread and of twist of the Piedmont organzines, No. 15 to 18, and the cleanness of their thread may bear critical observation; next to the Piedmont organzines, those of Bergam, upon our sample cards, deserve attention, and first and best is No. 19, filature of Sozzi; next that No. 20 of Maffei; both of them are of their *Filanda di Cosa home filatures*; these wealthy silk makers are generally the owners of several filatures; those at a distance are entrusted to the superintendance of agents, but the home filature receives the personal attendance of the owners, who attach a considerable pride to their perfection.

I wish to call your particular attention to the three samples Nos 12, 13, 14; they are raw silks from the filatures of the English East India Company in Bengal, raised in the open air upon the Mulberry trees, where the worms are set to feed, and left until they have made their cocoons; the quality of the silk raised in this easy way, is porous and weak, inferior in beauty of colour and brilliancy, by 50 per cent. to the value of the silks of Italy. These sample skeins I procured from London through the means of my respected correspondent, Timothy Wiggins, Esq. formerly of Boston, and to whom I sent a note of the sorts and qualities I deemed to be most fit to answer the purpose, I received them by return of the

packet, and Mr Wiggin declined making any charge for their cost, expressing his wish to contribute by this liberality to the success of the undertaking.

I shall close these notes on the favorite topics, of the desirable addition which silk would make to the products of our country, by observing that every natural indication of the soil and climate appears to encourage us with a promise of success; where the food may be made to grow freely, there surely, the creature appointed by nature to consume it, will prosper and delight; it is a fact beyond doubt, that the white mulberry does thrive in our climate without requiring any peculiar care, and is, I believe, never injured by caterpillars, nor any other insects, and it is also a fact that this tree will grow well on light loamy, and gravelly lands, and furnish, there, a food superior in quality, to what it would give upon richer and moister ground; whereby some of our plains, and other poor lands, might be brought, in time, to enrich their owners; another natural indication, which in Europe is held conclusive, almost to a proverb, is that our soil and climate, in the middle and southern parts of New England, are such as to insure constant and abundant crops of Indian corn.

Where Indian corn grows freely,
There is also a silk country.

The south of France, Piedmont, and Italy are Indian corn countries; Piedmont in all its abundance, cherishes its Indian corn, and there is not a meal there, upon the table of the opulent or of the poor, which is deemed complete, without the national dish called by them *poultin*, something like hasty pudding.

Giving a hearty good wish, for the success of your endeavors, to hasten the time, when the gilded vases of silk factories, shall shine in the brightness of our New England skies,

I remain truly, Mr. Editor, your friend, &c.

FOR THE NEW ENGLAND FARMER.

MAKING BUTTER.

MR. FESSENDEN,—By the earnest solicitations of a number of my neighbors, I am induced to ask information of you, through the medium of your useful paper, on the following subject: Many of my neighbors say, that after churning their cream (of about a week's dairy) a whole day, they are disappointed in getting butter. Some have been disappointed in this way, of late, in half a dozen instances in succession. If you have it in your power, please give the reason why it is so, and how it may be remedied, through the New England Farmer.

Your obt. and humble servant,
J. D. BORNING.

Kennebunkport, (Me.) 21st, May, 1828.

By the Editor. We know nothing on the subject of making butter, which is derived from personal observation. But we have had some conversation on the process with those experimentally acquainted with it. Milk or cream before it can be converted into butter must have curdled or soured, as well as have its elementary particles separated by agitation or churning. Mr De Witt says, (see page 322 of the present vol. of the N. E. Farmer,) "milk must have naturally soured, without any help but a little quantity of sour milk and especially without warming it." and has

given some other rules on the making of butter, which may be seen in the page above referred to. A writer for the N. E. Farmer, vol. iv. page 217, says, "I found by experiment, that the uncertainty of fetching butter in the winter, may be easily remedied by preparing the cream properly. Incorporate a little pure vinegar with the first quart of cream, that it may sour; collect the quantity to be churned, if it be not sour, add a little more vinegar, and warm it till it is sour, then heat it scalding hot. Let it then stand two days, and we are sure to have good butter in the winter."

The milk of some cows is more difficult to churn than that of others; and some milk yields more and better butter than that of others. It is therefore, well to put every cow's milk by itself—at least till its quality is discovered, and then ascertain by separate churnings its comparative value. See N. E. Farmer, vol. iv. page 350.

FOR THE NEW ENGLAND FARMER.

HORSES.

MR. FESSENDEN,—I observe in one of your late numbers that three stallions are expected at this port from England. Most of the names in their pedigrees are new names to me; as they are written. If I may be allowed to make a remark upon the subject it is to state that one of them, Barefoot, is of a particularly advantageous blood, and not one of the refuse horses that are sent here to prison our stock, but one of first-rate decided reputation at home. He is unquestionably, a horse of the highest reputation in England that has ever been brought young. He is, I believe, only eight years old, of a far superior class to a horse like Messenger. Before reading that communication I had not the slightest knowledge of the circumstances under which they were to come to this country. Yours, &c. J. L. ELWYN.

Boston, May 25, 1828.

FOR THE NEW ENGLAND FARMER.

EXTRAORDINARY COW.

MR. JEREMIAH STICKNEY, of Rowley, has a cow of a large size, and of a dark red color, remarkably well proportioned, and handsomely built, six years old, which recently produced a cow calf, weighing on the day of its birth, *one hundred and twenty pounds*. On the day the calf was two weeks old, it was again weighed, and found to have gained *forty-three pounds*; averaging an increase of a little more than three pounds a day. The calf is of the same color of the cow; and is, in every respect, as well built and proportioned. Besides supplying the calf, the cow now affords six quarts of milk, of the richest kind, daily. She had been wintered on common keeping, which in this place is salt hay. S. P.

HORTICULTURAL IMPROVEMENT.

MR. FESSENDEN,—In your last paper is a notice of an experiment by a fair horticulturist, on the application of *hot water* to the roots of peach trees. A similar application was made by me last year, at the suggestion of Prof. Nuttall, by whom I was informed that it had been practised by a friend of his near Philadelphia, for several years with great success. Although fearful of destroying my trees, I laid bare the larger roots, and *scalded* them; the trees received no injury, and are now in health.

I have extended the use of hot water to beds in which radishes and other vegetables are cultivated, scalding the earth *before sowing* the seeds; by which means, I have destroyed the larvæ of many insects with which a rich soil is so apt to be replete.

A SUBSCRIBER.

Cambridge, May 27, 1828.

FOR THE NEW ENGLAND FARMER.

FRUIT TREES.

MR. FESSENDEN,—I send you enclosed, a communication, on the subject of new fruits just received, for insertion in your Farmer.

Respectfully,

WM. PRINCE.

The following collection of fruits has been presented to me, by John Braddick, Esq. of Boughton Mount, one of the most eminent and intelligent members of the Horticultural Society of London:

PEARS.

Forme de Marie Louise, the best autumn standard, ripe in Nov. and Dec.
William's Bon Chretien, autumn standard, ripe in Sept. and Oct.
Aston Town, same qualities as above.
Belle Lucratif, standard, ripe in Aug.
Napoleon, wall, ripe in Dec.
Present de Malines, wall, Dec. and Jan.
Passe Colmar, wall, Jan. and Feb.
Marie Louise, wall, Nov.
Poir d'Anana, wall, Jan. till March.
Poir d'Auch, wall, Jan. till March.
Duchesse d'Angouleme, not yet fruited.
Neils d'hyver, wall Dec. and Jan.

APPLES.

Graveinstein.
Red Astracan.
Hunt's Duke of Gloucester.
Seedling Nonpareil.
Nonpareil.
Ashmede's Kernel,
Luccomb's Pine.
Merton Nonpareil.
Cornish July flower, a fine keeping apple.
Kentish fill basket.
Beauty of Kent.
Kentish Conqueror, keeps till May.
Sweeny Nonpareil.
Emperor Alexander.
Golden Harvey, or Brandy apple—a fine desert fruit, keeps till April.
Wellington, a fine keeping apple.
Kerry Pippin, an Irish desert apple.
Court Pendu, plat et rogaetre, a French desert keeping apple.
Court of Wick, the best of the seedlings, raised from the old Golden Pippin.
Crofton, or Irish Nonpareil.

STRAWBERRIES.

Knevett's Pine.
Wilmot's Superb.
Aberdeen Hautbois.
Early Globe.
Bishop's Orange,
Cionamon.

I am happy to state that nearly the whole number were received in good order, and several have been grafted from each kind of the apples and pears with every prospect of success; several of the kinds had been previously received by me and considerably increased.

Flushing, Long Island, May 22, 1828.

FOR THE NEW ENGLAND FARMER.

DESTROYING BUGS ON VINES.

Mr. FESSENDEN.—The season is approaching when gardeners may have difficulty in preserving their young cucumbers and melons from being eat by the small yellow speckled bug.

A cheap and easy remedy. I accidentally discovered one evening, (a few years ago,) by seeing them fly into the candle. The next evening about dark, I built several light blazing fires in my garden, and repeated them several evenings: they all disappeared, and I expect were burnt to death.

Since that, if I see any of them in my garden, I build a few such evening fires, and receive no damage from them: indeed, they appear to be nearly exterminated from the premises.

SAMUEL PRESTON.

Stockport, Pa. May 19 1828.

SIGNS OF A POOR FARMER.

He grazes his mowing land late in the fall, and his pastures early in the spring, and consequently ruins both. Some of his cows are much past their prime. He neglects to keep the dung and the ground from the sills of his buildings, and it costs him twenty dollars to make repairs when one dollar's worth of work would have been sufficient if performed at leisure time ten years before. He sows and plants his land until it is exhausted before he thinks of manuring. He has generally too much stock, and many of them unruly. He is always sure to have a great deal of stake and pole fence. He says that he cannot farm it for want of money: this is frequently the case with good farmers, but you may know a sloven by his inattention to little things—his children's shoes are spoiled for shoe strings to tie them, or for want of a little tallow to supple them—his door hinges comes off for want of a nail, and the door is destroyed for want of a lunge, and his mow is trampled on and cattle gored for want of a door; and all this loss is occasioned by not timely driving and clenching a single nail. Nothing is in order—he has a place for nothing, and nothing in its place. If he wants a gimblet, a chisel, or a hammer, he hunts up chamber, out at the barn and corn-house, in the cupboard, and lastly when he has spent more time in pursuit than it takes him to do the job, he finds it down cellar. He keeps no stock of the smallest things; if a button or a bail to a pail gives way, or a key to a yoke, or a pin to a sled, or a helve to an axe, a string or a swingle to a flail, or even a tooth to a rake, he has none to replace them. He seldom does any thing in stormy weather, or in an evening, and is sure to keep no memorandum of little jobs that are to be done. You will perhaps hear of his groaning about the hardness of the times frequently in a bar room. Death and the tax-gatherer he knows must come; yet he makes no provisions for either of them.—Although he has been on a piece of good land for twenty years, ask him for a grafted apple, and he will tell you that he could not raise them for he never had no luck. His indolence and carelessness subject him to many accidents. He loses soap or cider for want of a hoop—in the midst of his busy ploughing, his plough breaks because it was not housed; and when he is reaping away from home his hogs break into his garden for want of an additional board. He does not take the advantage of his business by driving it when he can, and consequently he is like the old woman's son, "so busy that he never does any thing;" or at least he

seldom finishes one thing before he begins another, and therefore brings little to pass, and is often to be seen in a great hurry. He is seldom neat in his person, and will sit down to table without combing his hair, and suffer his children to do so without washing their hands and faces. He frequently drives his cattle with a club, and is generally late to public worship. His children are also apt to be late at school, and their books are torn and dirty. He is careless; his children and domestics are so too. As he has no enterprise, so he is sure to have no money. If he must have money, he frequently makes great sacrifices to get it; and as he is sleek in his payments, and buys altogether on credit, he pays through the nose for every thing. His want of forethought, economy, and exertion makes him poor, and his poverty tendeth to poverty. You will generally see the smoke begin to come out of his chimney long after the light in winter. His horse stable is not daily cleaned out, or his horse littered, and carried.—Boards, shingles, and clapboards are to be seen off his buildings month after month, without being replaced. He feeds his hogs with whole grain and suffers them to be much injured for want of a warm pen; he seems to live without thinking; if his lambs die, or the wool comes off his sheep, he does not seem to think that it is for want of care and food. He is generally a troublesome borrower, and frequently forgets to return the thing he has borrowed.

In a word, a poor farmer in the strict sense of the word, is a poor creature—he is a poor husband, a poor father, a poor neighbor, and a poor citizen. A good farmer may be poor, but a poor farmer cannot act his part well; in other words, he cannot be good as a man or as a christian.

EXTRACTS FROM VARIOUS AUTHORS.

Seed.—Let your seed be such as you would wish to have your future crop—the best of the kind. As the largest animals produce the most profitable stock, so it is in vegetables: the largest seed of the kind, plump and sound, is the best, being well ripened, and kept from injuries of weather and insects.

Commonly speaking, new seed is to be preferred to old, as growing more luxuriantly, and coming up the sooner and quicker. As to the age of seeds, at which they may be sown and germinate, it is uncertain, and depends much how they are preserved.

Seeds of cucumbers, melons, gourds, &c. which have thick berry coverings, and the oil of the seed of a cold nature, will continue good for ten, fifteen, or even twenty years, unless they are kept in a very warm place, which will exhaust the vegetable nutriment in a twelve month; [three years for cucumbers, and four for melons, is generally thought to be best, as they shoot less vigorously than newer seeds, and become more fruitful.]

Only seeds whose coats, though they are not so hard and close as the former, yet abounding with oil of a warmer nature, will continue good three or four years, as radish, turnip, rape, mustard, &c.

Seeds of umbelliferous plants, which are for the most part of a warm nature, lose their growing faculty in one, or at most two years, as parsley, carrots, parsnips, &c.

Peas and beans of two years old are by some preferred to new, as not likely to straw.

Sowings should be generally performed on fresh dug or stirred ground. There is a nutritious

moisture in fresh turned up soil, that softens the seed to swell and germinate quickly, and nourishes it with proper aliment to proceed in its growth with vigor, but which is evaporated soon after from the surface.

Evenly sown seeds for the garden cannot be sown too shallow, so they are preserved from birds, for nature never covers them.

Steeps are used to render the seed more fruitful, as preservations against distempers, and to prevent worms from eating it.

[There are many well attested facts to prove the utility of steeping seed for sowing. In some dry seasons, especially, the steeping of the seed or not steeping of it, makes the difference of a good crop or no crop at all. Steeps may be chamber lie, the chaining of a dung hill, or a weak solution of salt in water. In either of these the seed should be soaked eight or ten hours; when taken out, sprinkle over it a quantity of newly slacked lime, or plaster of Paris, or even ashes, stirring the seed until every grain is covered.—This operation is done immediately before sowing.]

Tall relates that a ship load of wheat was sunk near Bristol in autumn, and afterwards, at ebbs, all taken up, after it had been soaked in sea water: but being unfit for the miller, the whole cargo was bought up by the farmers, and sown in different places. At the following harvest all the wheat in England happened to be smutty, except the produce of this binned seed, and that was all clear from smuttness. This accident has justified the practice of brining ever since, in most parts of England.

Liverwort.—A correspondent of the National Intelligencer gives some interesting particulars of the *Hepatica Triloba*, or Liverwort, the valuable properties of which, in pulmonary complaints, have so recently been discovered, and in many instances successfully tested. The plant, it appears, was cultivated in England, by Gerard, as long ago as the year 1536. There are two distinct varieties of the species—the one *obtus*, "having the lobes of the leaves rounding, obtuse; the other *acuta*, having the lobes of the leaves acute." The former is found in forests, the latter on mountains.

Dr. Hereford has communicated another article on this subject, in the same paper. It is in reply to a writer in a late Eastern paper, who thinks that the Liverwort is useless in cases where the lungs have become so far diseased, as actually to discharge pus. This opinion is controverted by Dr. H. who affirms that the medical virtues of this plant have been known to operate successfully, in many instances, even after that alarming symptom has appeared, and when extensive ulcerations of that organ must have existed. This is a most encouraging consideration, and one which should prompt the thousands of consumptives with which our country unfortunately abounds, to an immediate persevering trial of this panacea. It is necessary that special caution be used in order to obtain the genuine plant—as mistakes may not only prove fatal, but result in a loss of public confidence in the properties of an herb, which, when genuine, is of the highest value to afflicted man.

Boston Bulletin.

The importation of tea from Canton to New South Wales, within the last two years, has been carried on to such an excess, that this article is almost as cheap at Sidney as sugar.

From the Massachusetts Agricultural Repository.

MAKING CHEESE.

The milk is universally set for cheese as soon as it comes from the cow. The management of the curd depends on the kind of cheese; thin cheese requires the least labor and attention.

Breaking the curd is done with the hand and dish. The finer the curd is broken the better, particularly in thick cheeses. The best color of this kind of cheese is that of bees wax, which is produced by Annotta, rubbed into the milk after it is warmed. The dairy woman is to judge of the quality by the color of the milk, as it differs much in strength. The rennet is prepared by taking some whey and salting till it will bear an egg; it is then suffered to stand over night, and in the morning it is skimmed and racked off clear; to this is added an equal quantity of water brine, strong as the whey, and into this mixture, some sweet briar, thyme, or some other sweet herbs—also a little black pepper and salt petre; the herbs are kept in the brine three or four days, after which it is decanted clear from them. Into six quarts of this liquor four large calves' bags or more properly calved calves' stomachs are put.—No part of the preparation is heated, and frequently the calves' bags are only steeped in cold salt and water. Turning the milk differs in different dairies; no two dairy women conduct exactly alike.

Setting the milk too hot inclines the cheese to heave, and cooling it with cold water produces a similar effect. The degree of heat varies according to the weather. The curd when formed is broken with what is called a treple cheese knife. The use of this is to keep the fat in the cheese; it is drawn the depth of the curd two or three times across the tub, to give the whey an opportunity of running off clear; after a few minutes the knife is more freely used and the curd is cut into small pieces like chequers, and is broken fine in the whey with the hand and a wooden dish.—The curd being allowed about half an hour to settle, the whey is laded off with the dish, after it is pretty well separated from the curd.

It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added to it and stirred a few minutes; some make use of hot water in preference to whey, and it is in both cases heated according to the nature of the curd; if it is soft, the whey or water is used nearly boiling; but if hard, it is only used a little hotter than the hand. After the curd is thoroughly mixed with the hot stuff, it is suffered to stand a few minutes to settle, and is then separated as at the first operation. After the scalding liquor is separated, a vat, or what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hands and pressed into the vat, to squeeze out the whey. The vat being filled as full and as firmly as the hand alone can fill it, and rounded up in the middle, a cheese cloth is spread over it and the curd is turned out of the hoop into the cloth; the vat is then washed and the inverted mass of curds, with the cloth under it, is returned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out and the cloth is taken off, washed and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and

salted, the cheese is placed on a board and a handful of salt rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewed on the upper side, and as much left as will stick to it; afterwards it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press; here it continues one night and the next morning it is turned in the vat, and continues till the succeeding morning, and the curd is taken out and placed on the dairy shelf; here they are turned every day or every other day, as the weather may be. If it is hot and dry, the windows and door are kept shut, but if wet or moist, the door and windows are kept open night and day.

Cleaning the Cheese.—The cheeses having remained about ten days after leaving the press, are to be washed and scraped in the following manner; a large tub of cold sweet whey is placed on the floor, the cheeses are immersed in it, where they continue one hour, or longer if necessary, to soften the rind. They are then taken out and scraped with a common case knife, with great care, so as not to injure the tender rind, till every part of the cheese is smooth; they are after the last operation rinsed in the whey and wiped clean with a coarse cloth, and placed in an airy situation to dry, after which they are placed in the cheese room. The floor of the cheese room is generally prepared by rubbing it with bean or potato tops or any succulent herb, till it appears of a black wet colour; on this floor the cheeses are placed, and turned twice a week, their edges are wiped hard with a cloth once a week, and the floor is cleansed and rubbed with fresh herbs once a fortnight. They must not lie too long or they will stick to the floor. This preparation of the floor gives the cheese a blue coat, which is considered of great consequence.

Stilton Cheese, how made.—The Stilton Cheese, which may be called the Parmesan of England, is not confined to Stilton and its vicinity, for many farmers in Huntingdonshire, and also in Rutland and Northamptonshire make a similar sort, sell them for the same price, and give them the name of the Stilton Cheeses.

Take the night's cream and put it into the morning's new milk with the rennet; when the curd is separated let it not be broken as is done with other cheese, but take it out, disturbing it as little as possible, suffer it to dry gradually in a sieve; and as the whey separates, compress it gradually till it has acquired a firm consistence, then place it in a wooden hoop and suffer it to dry very gradually on a board, taking care at the same time to turn it daily with close binders round, and which must be tightened as the cheese acquires more solidity.

Skippers in cheese. Wrap the cheese in thin brown paper, so thin that moisture may strike through soon—dig a hole in good sweet earth about two feet deep, in which the cheese must be buried about thirty-six hours, and the skippers will be found all on the outside of the cheese brush them off immediately and you will find your cheese sound and good.

To prevent cheese having a rancid nauseous flavor. Put about one table spoonful of salt to each gallon of milk when taken from the cows in the evening, for the cheese to be made the next day; put the salt at the bottom of the vessel that is to receive the milk; it will increase the curd and prevent the milk from growing sour or putrid the hottest nights in the summer.

QUINCES.

This tree may be cultivated by scions and layers, or by budding on stocks of the same, or on the pear, hawthorn, &c. It flourishes best in a moist soil, where it produces the greatest crops, but will thrive in almost any good upland soil. It requires little attention as to pruning, but must be kept clear from suckers at the root; an occasional thinning out, however, of superfluous upper branches, where too close and interfering with one another, would be advantageous. The orange quince is the earliest in ripening, and the pear and Portugal next, and the winter being the latest of all, may be preserved for a long time, and used as occasion requires.

Chinese Quince. This tree is said to produce flowers of a fine red color and pleasant odour, and to yield oblong fruit of a beautiful appearance, which ripens in October and November; the fruit however, is not considered suitable for the table, or equal to other quinces for preserves; and the tree must be considered as more calculated for ornament than use.

Japan Quince, or Cydonia Japonica. This was formerly called *Pyrus Japonica*, and it is not till latterly that its title has been changed, after the discovery that its fruit, when well ripened, is of good size and nearly equal to the favorite quinces, usually cultivated in our gardens; there are two varieties, one with scarlet and the other with pale blush colored blossoms, which are very ornamental; the fruit of the two varies also as well as the blossom. A third variety, with semi-double flowers, is now cultivated, but is still rare.—*Prince on Horticulture.*

EXERCISE.

Horse riding is one of the most healthy exercises that can be adopted. A horse well mounted with a good rider, makes a fine appearance; but the present method that is practised in this country, of horse riding, is injurious both to the horse and rider, on account of the saddle being placed almost on the withers, which prevents the horse from moving his shoulder blades with ease, which is the cause of so many horses falling down, and what is called breaking their knees that often leaves a blemish during the life of the horse, besides both the rider and horse make a bad appearance, in the eyes of proper judges; likewise, the rider does not enjoy the spring of the horse's back, as he would if the saddle was made to continue more on the centre of the back, which can be easily accomplished, by means of a crupper being placed to the saddle, to go under the horse's tail. That part of the crupper that goes under the horse's tail, should have a pad or cushion made of soft chamois leather, stuffed with cotton, and should not be less than one inch in diameter; this will help to elevate the tail, and the horse, with his rider, will find more ease. It should be considered that the horse carries far more weight on his fore legs than on his hind ones, owing to his head and neck, and likewise his rider, which is the cause of many horses going lame with their fore feet—another cause may be ascribed for the lameness of horses, which is, that the smiths that shoe them cut down the heels, and pare away the frogs and finders that nature has appointed as a guard over the *oscula* and *coronet* bones of the foot. All smiths that shoe horses should well understand the anatomy of the foot; and the owners of them should give strict orders that the frogs, heels and

finders should not be cut away. I have, for some time past, thought of making these remarks, and having no pecuniary interest in view, my only wish is to remedy what I conceive to be an evil. *N. Y. Statesman.*

CHEESE.

There are many people who dislike coloured cheese; and we have often heard it suggested that it would be desirable that the Agricultural Society should offer one of their premiums for the *best cheese not coloured*. We confess we are not without our objections—*prejudice* it may be—against coloured cheese; and knowing there are many good dairies in the country in which cheese is made of a *natural complexion*, and being desirous of having some specimens of such cheese exhibited at our annual Cattle Show, we now offer a premium of \$2 and the Massachusetts Yeoman for one year, to the person who will exhibit the best specimen not less than 40lbs. of cheese *not coloured*, at the Cattle Show in this town, on the 8th. of October next—the premium to be awarded by the Committee of the Agricultural Society, or by other competent and disinterested individuals. The value of the premium we know is inconsiderable; but perhaps, by the liberality of other individuals, we may be enabled to increase it.—*Worcester Yeoman.*

PINE WOOD AND STEAM BOATS.

The steam boats are making havoc with this kind of fuel. It will be as scarce and dear by and by as mahogany. Take the North River for instance. Thirteen boats between Albany and New York, consume, it is said, fifteen hundred cords per week, the ferry boats about fourteen hundred more. The consumption on the North River alone is put at more than three thousand cords a week, making at least one hundred thousand cords of wood in eight months, worth 500,000 dollars. The Sound Boats, also burn their proportion, perhaps one fourth as much. In one trip we were told three hundred dollars' worth of wood was consumed by one of the Sound boats. Where is this fuel to come from many years longer?—Coal must be substituted, or we shall have a general clearing in the Northern and Middle States. *Providence Microcosm.*

CHEAP RECEIPTS, TO INSURE HEALTH.

1. *Rise Early.* Walk or ride for an hour or two, then eat a hearty substantial breakfast. Let your other meals be moderate, and use exercise freely (by walking, skipping, or in any other way) before going to bed. This receipt has lately been recommended in strong terms by Sir Astley Cooper, and many others of the most eminent physicians and surgeons in London. Its first direction is consistent with Franklin's well known maxim—"Early to bed, and early to rise, will make a man healthy, wealthy and wise." Its last direction equally agrees with the well-known couplet—"After dinner, sit a while (i. e. a few minutes) after supper, walk a mile."

2. Keep your feet warm (i. e. by exercise)—your head cool, (i. e. by temperance;) and your body open (i. e. take great care to avoid costiveness.) This was the golden rule of *Boerhaave*, the greatest physician in modern, or probably in ancient times; who concluded his advice by saying something to this effect—"If people would only observe these plain simple rules, and would avoid a current of air as they would an arrow, physi-

cians would be altogether an useless class of beings."

3. *For Children.*—"Give them plenty of milk; plenty of flannel; plenty of air; and let them have plenty of sleep; and they will seldom, if ever all any thing." That is, milk is their best diet; they must be warmly clothed; must be much out of doors; and must be always allowed to sleep on till they waken of their own accord.

And now, Mr. Editor, I challenge any medical man, or any other of your readers, be he who he may, to discover any reasonable objection to these plain, simple rules, or to offer better. If he can, I shall set him down as a wise man, and a beneactor to the human race. Were they my own it would be consummate arrogance to say this, but they are the deliberate recommendations of the ablest of men; and they are the obvious dictates of nature.

Yeast.—A method of making what may be called a portable or durable yeast, is as follows:

Take a quantity of hops, suitable to the quantity of yeast you intend to make, boil them well, and strain off the water in which they are boiled; into this water stir a suitable quantity of flour, and considerable salt, and then add to this a proper quantity of good yeast; let this mass rise as much as it will; then stir in fine Indian meal till it is so thick as that it can be made into small cakes of the size of a dollar or larger. When the cakes are thus made, dry them in the sun till they are hard, minding to turn them frequently to prevent their moulding, and then lay them by in a dry place, for future use. When you wish to have yeast, take one of these cakes, crumble it in pieces, pour warm water on it, and let it stand in a warm place, and it will soon rise sufficiently to make good yeast. A quantity of these cakes may be thus made at once, which will last for six months or more.—*Farmer's Assistant.*

Bartlett Pear.—This pear weighs about 10 oz. when at full size, shaped like a Bon Chretien, very yellow, and slightly tinged with red on one side; quite juicy, and by many considered a first rate fruit. It is not however, equal in flavour to the Seckel, or even to the Boston Epergue, but its size and beauty render it greatly admired. It much resembles in flavour and consistence the St. Michael, and is said to command a high price at market. It is no doubt a native, and appears to have originated in the vicinity of Boston; and it does not seem at all strange that many fine new pears should have originated there, as that city, and its environs, has for a long period been inhabited by a great many gentlemen extremely intelligent on the subject of Horticulture, who took much pains, at an early date, to introduce the choicest fruits, and particularly the finest varieties of pears, of which fruit they are skillful connoisseurs.

Prince of Horticulture.

Driving Stock.—The driving of live stock to the British Provinces of New Brunswick and Nova Scotia has commenced; and last week a drove of some 70 or 80 cattle of excellent appearance, and another of about 25 horses, passed this village on their way east. What number of men for employ, speculation, and beasts for market, go annually from Maine to these Provinces, we know not, but probably more than one thousand of the former, and some tens of thousands of the latter. We

should be obliged to some person better acquainted with this business than ourself, for an estimate in relation to these matters.—*Maine Paper.*

Vinegar.—The method of making this liquid out of cider, wine, &c. is too generally known to need any description; but it is not so generally known that a very sharp vinegar may also be made out of wney. The method of making it, as described by air. Genet, is very simple. After having clarified the wney, it is poured into casks with some aromatic plants, or clover blossoms, [as suits the fancy,] and exposed in open air to the sun, where it soon acquires an uncommon degree of acidity. Vinegar may also be made from the juice of elderberries, mixed with a suitable proportion of water, and exposed to the sun, as before mentioned. It may also be made from the juice of the black-birch, or of the maple, when either is boiled down sufficiently; or from the juice of beets, carrots, turnips, potatoes, &c. when boiled and the juice pressed out, and exposed in like manner.—*Farmer's Assistant.*

The Columbian Institute has just received from Tangier, in Morocco, some Wheat and Barley, which, it is supposed, may form an useful addition to the stock of those grains already in the United States, particularly in the States and Territories south and south-west of Washington. The Institute has also received some seeds and fruit of the *dote*, which have been sent under a belief that they may be successfully cultivated in the most southern parts of the Union. Tangier, whence those grains and seeds are brought, is in lat. 35 deg. N. Though black frosts are rare, white frosts are frequent there in January, February, and March.—Those members of Congress who may wish to obtain a portion of either or all of those objects, will please to make known their wishes to Mr. Dickens, the Secretary of the Institute.—*National Journal.*

Damp Destroyer.—By placing an unstopped bottle or more open vessel, if convenient, containing strong sulphuric acid, in any part of the room, the moisture becomes rapidly absorbed, and the salubrity of the apartment consequently improved. The great capacity of sulphuric acid for vapor, and the cheapness of the acid, renders this mode of absorbing humidity very economical.

To destroy slugs on land.—Procure some fresh lime, and after throwing as much water upon it as will reduce it to a powder, sow the lime in a hot state upon the land that is overrun with the vermin, at the rate of about twelve bushels to the acre. The lime should be sown towards the wind and falling upon them in a fermented state, it will instantly kill them.

Fire by Lightning.—On Saturday night, the 27th. inst. between 1 and 2 o'clock, the barn of Mr. Anson Whaples, of Weathersfield, (Newington Parish) was consumed by lightning, and his cow destroyed by the same stroke; by which event of Providence an industrious man has become deeply afflicted and embarrassed.—*Conn. Observer.*

Strawberry.—The common strawberry in a ripe state makes a most excellent dentifrice, sweetening the breath and preserving the gums. It is said that the celebrated Linnæus cured himself of gout by a persevering use of strawberries as an article of diet.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 30, 1896.

ITALIAN SILK.

☞ Skein samples of Italian Raw Silk and Organzine, forming together an assortment of the most esteemed fixtures of Italy, and exhibiting the beauty and the richness of that noble product, have been left at the office of the New England Farmer, No. 52 North Market street; with an invitation to all those who feel an interest in the introduction of the cultivation of that precious commodity into our country, to call and view the specimens alluded to. The articles, together with the case in which they are inclosed, were furnished by Mr. J. M. GORGAS, of Weston, Mass. whose liberal and patriotic efforts manifested on this and many other occasions, to elicit and direct the efforts of American Industry to objects which bid fair to promote national as well as individual prosperity, merit the thanks and gratitude of the community.

IMPROVED SHORT HORNED BULL.

☞ The Bull BULLY ARK, imported and owned by Col. POWELL, said by the best judges to be equal to any animal of the kind in Great Britain; and belonging to that branch of the short-horn family, which is particularly noted for its excellence as *Dairy* stock, will stand the coming season, at the stable of Col. SAMUEL JAMES, JR., in Charlestown, Mass. Price for each cow by the season \$5. Further particulars respecting this superb animal in our next.

SALTING BUTTER.

There is no branch of rural economy in which our good New England house keepers appear to be more deficient than in the manufacture and preservation of butter. With regard to its manufacture we have, in the present volume, repeatedly, published ample directions. We have likewise given Dr Anderson's famous recipe for preserving butter, page 372. But a friend requests us to publish the following receipt which is substantially the same with that of Dr Anderson, with some additional directions which he states are very important.

RECIPE FOR PRESERVING BUTTER.

"Take two parts of salt, one part of salt petre, and one part of *Loaf* sugar—pound all fine, and then mix them well together. Put one ounce of the composition to each pound of butter, taken from the churn, and mix it well in with the butter, as you formerly did the salt.

"The salt should be well dried before weighing it. Care must be taken in the first place to work the butter-milk well out."

This receipt differs from that of Dr Anderson, which we have repeatedly published, in directing that the sugar should be *loaf* sugar, and that care should be taken to dry the salt before it is used.

RAISING CALVES.

Calves should not be suffered to eat any grass the first year; and it is cheaper to keep them shut up and feed them, as the land sufficient to pasture one will well produce hay sufficient to keep two calves through the year, and pay the expense of cultivation, and one year's growth will certainly be added to the cattle.

Mortimer, (an English writer) says "The best calves for bringing up, are those calved in April, May and June: because it is seldom that those which come later acquire sufficient vigor to support them during the inclemency of the following winter; and the cold causes them to droop, and many of them to die." Much oftener may this be expected to be the case in this country, where the cold in winter is so much more intense.

Those which come earlier are preferred in this country, being more hardy, and better able to en-

sure the rigour of the first winter. But the cost of rearing them is greater. All things considered, April may be as suitable a time as any.

When calves are weaned, they should not be suffered to be with their dams till fall. Neither should they be pastured within sight or hearing of them. It will cause them to neglect their feeding; and they will not forget their habit of sucking their dams.

COWS.

Pure water, it is stated in the Domestic Encyclopedia, is an essential article for cows. Dr Anderson says, he knew a man who acquired great wealth, by attending to things of this nature, and one of his principal discoveries was the importance of having a continued supply of the purest water that could be obtained for his cows, and he would on no account permit a single animal to set a foot into it, nor allow it to be tainted even by the breath of animals.

Inflamed teats should be washed with two drachms of sugar of lead in a quart of water.—Should tumors appear apply a common warm mash with bran with a little lard.

To prevent cows from sucking their own milk, we are informed that rubbing the teats frequently with the most fetid cheese that can be procured has proved an effectual remedy;

REMEDY FOR TICKS IN SHEEP

The following extract is from a communication from a friend, in West Boylston, Mass. "Boil a small quantity of tobacco, perhaps what grows on one thrifty stalk would be enough for half a dozen sheep, in so much water that when it is boiled there shall be 2 or 3 gallons of liquor; let it become sufficiently cool, then open the wool along the centre of the neck and back of the sheep, and with a bunch of tow or some other spongy substance put on the decoction until the skin becomes thoroughly moistened therewith, and in a short time the ticks will all be destroyed."

TO PRESERVE GARDEN VEGETABLES FROM BEING INJURED BY FROST.

After a freezing night, sprinkle by day break, cold water plentifully all over the frozen vegetables from a water-pot.

Fresh oak saw dust strewed on gravel walks, will prevent the growth of weeds on them.—*London pa.*

DAIRY.

Pans in which milk is deposited in warm weather, should, if possible, be placed in shallow troughs filled with cold water, supplied at one end from a spring, and constantly running out at the other. This keeps the milk cool and causes the cream and of course the butter to be sweet. Churning is sometimes difficult in consequence of the thickness of the cream. In such case it is recommended to mix as much or more new milk with the cream as there is of the cream, which will save much labour in churning.

SOAKING SEED CORN IN COPPERAS WATER.

The importance of this cannot be too generally enjoined on farmers. In the fourth volume of the New England Farmer, page 281, we published a communication from a correspondent, dated Gloucester, March 18, 1896, and signed *A Subscriber*, recommending the use of copperas water to preserve Indian corn from the wire worm, from which the following is extracted; "I used about one and a half pounds of copperas in three pecks of corn. I made the water warm, and soaked the corn full

48 hours before planting, putting in copperas as we use it out. It is not easy to use too much copperas. I believe the more the better." This preparation the writer says, "I am confident is a full and entire remedy against the wire worm, and also against birds, who will not eat it after they have pulled it up. I am even sanguine in my belief that it is a preventive against the ravages of the cut worm, for I could not otherwise account for their not injuring my field, when many of my neighbors actually lost most of their fields, and some of them were under the necessity of replanting."

It appears, likewise, that "Mr. Ralph Owen, of Belchertown, Mass. in May last, planted three or four acres with corn which had been soaked in copperas water; the seed came up well and not a plant was destroyed by worms. An adjoining field, planted with corn which had not been steeped was very much injured." We have likewise been verbally informed by gentlemen, who have experienced or witnessed the effects of the above mentioned preparation, that it has in every instance, completely answered the purpose of a preservative against insects; and it is supposed, greatly to accelerate the growth of the young plants, by its fertilizing properties.

POTATOES

Many farmers are in the habit of giving raw potatoes to all kinds of stock; but they are of a watery and griping nature, and accidents have frequently happened from their use, before the cattle have become accustomed to them. For milk cows they are very bad, purging them and rendering their milk too thin and poor even for suckling.—If given raw to fatten oxen, good hay and bean meal should be allowed to counteract the watery quality of the roots. There is, however, much difference in the nature of potatoes, and the mealy approach nearest to the nature of corn; the yellow afford the strongest nutriment.—*S. Magazine.*

SILK CULTURE.

A manual on the culture and manufacture of silk, has just been printed by order of Congress. It was prepared under the direction of Secretary Rush. A gentleman of Baltimore has received from South Carolina, a specimen of silk raised from a quantity of silk worms' eggs, by certain ladies in that state. The ladies, in a letter, written by them, say that they raised *five hundred* worms with so little trouble, that they propose to attempt a *million* next year. It will be recollected, that it was a lady of South Carolina, who first introduced the culture of cotton into the southern States, about 30 or 40 years ago.—*N. Y. Enquirer.*

Praiseworthy.—A lad fourteen or fifteen years old, was saved from drowning in this village, last week, by the presence of mind of Joel Bacon, a lad somewhat older. The younger boy had fallen from a boat beneath the bridge, at the west end of the village, in fifteen feet water. He was unable to swim, and his cries for help drew numbers upon the bridge, who proposed various methods of rendering assistance, by throwing in ropes, planks, &c. But in the confusion of the moment, though many things were thought of, nothing was done, and the lad had sunk to rise no more by his own exertions. At this juncture, young Bacon, who was at work in the tinner's shop of Mr. Damon, ran out, threw off his coat, leaped from the bridge, brought up the drowning lad to the surface, and

swam with him safely to shore. Such is the advantage of skill in swimming, and presence of mind in the midst of danger. Every boy should learn to swim.—*Berkshire American.*

Enormous Pig.—There is at present in Prince Edward Island, Nova Scotia, a Pig of the following size: length 9 feet 6 inches; girth round the body 7 feet 4 inches; round the neck 5 feet; height 3 feet 11 inches, and weight upwards of 1000 lbs. It was raised on the Island from a breed originally from Ireland, and is now about to be shipped to Halifax for exhibition. It was purchased for \$76.

Light.—According to some very elaborate experiments of Dr. Bradley, light moves at the rate of 195,248 miles in a second. Other accounts state the number of miles at 170,000. The velocity of light, according to the calculations of philosophical investigators, exceeds that of a cannon ball by 1,550,000 times. It is calculated that it travels from the sun to the earth in eight minutes and thirteen seconds.

Essex farmers.—The amount of English hay carried into Boston by the farmers of Ipswich, Essex, and Hamilton, during the six months ending on the 3d of March last, was six hundred and sixty tons and a half. The greatest load carried at any one time, was 6,873 pounds. The smallest load was 3,203 pounds.—*Salem Gaz.*

The Society for the Encouragement of Industry has offered liberal premiums for a mill for cleansing buck-wheat; various prizes for the construction of simple instruments for extracting sugar from the beet root; for the importation into France and the cultivation of plants, useful in agriculture, manufactures and the arts, &c.—*French pa.*

Emigrants.—About 500 Swiss emigrants have arrived at New York from Havre. The applicants for passages were more numerous than could be accommodated by the American vessels. It is said that from one district of Switzerland, near 6,000 persons were making arrangements to embark for America.

Old age.—A gentleman has left at our office, (says the Ipswich Journal), a specimen of some thread which he informs us was spun by a Mrs. Margaret Wood, of Boxford, on the 20th of April last, being the day she completed her one hundredth year.

Planting Fruit Trees.—Let it be observed as a general rule, always to plant or transplant your fruit trees, before a leaf expands or a blossom appears; it is true, that some plant later, but never with equal success.

School Boy Capers.—It is said, that a son of Mongo Park, who lately proceeded to the interior of Africa, "has been slain in the *Akumbo country*" Probably *elbowed* out of existence.—*N. E. Weekly Review.*

To preserve Hams.—Hams after being smoked may be preserved through the year by packing them away in oats.

Potato Onions should be frequently hoed, and the earth loosened round them, at this season.

Clean castors and a clean table cloth, are essential ingredients to domestic happiness.

Useful Hints relative to Bedclothes, Mattresses, Cushions, &c.—The purity of feathers and wool employed for mattresses and cushions ought to be considered as a first object of salubrity. Annual emanations may, under many circumstances, be prejudicial to the health; but the danger is still greater, when the wool is impregnated with sweat, and the excrementitious parts of persons who have experienced putrid and contagious diseases. Bedclothes, and the wool of mattresses, therefore, cannot be too often beat, carded, cleaned, and washed. This is a caution which cannot be too often recommended.

It would be very easy in most situations and very effectual, to fumigate them with muriatic gas.

MILLET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of superior quality gentlemen in want of this article are requested to call and examine it.

Also, a further supply of Orchard Grass, Lucerne, Fowl Meadow, Mangold Wort, Sugar Beet, Ruta Baga, Kidney Beans, &c. with several new varieties of Turnip Seed from Europe, including the Yellow Malta, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh White Mustard Seed.—Also, Green Citron, Pine Apple, and Pomegranate Musk Melons; and Carolina and Long Island Water Melons.

A further supply of Double Mexican Dahlias. 100 Single Dahlias, at the low price of 25 cts. each plant. With every variety of vegetable and ornamental flower seeds.

New Variety of Radish.

For sale at the New England Farmer Seed Store, a few pounds of Long White Summer Naples Radish, a variety highly esteemed in the Southern States.

Admiral.

The subscriber informs those disposed to improve by this fine imported animal, whose stock is beautiful, that he will be kept for this season only, on the Welles Farm, Dorchester. Terms \$3. m16 A. GREENWOOD.

Gunpowder, &c.

De Pont's Gun Powder, at 25 to 50 cts. per pound.—Shot—Balls—Blind and Percussion Caps.—Blue Vitriol, &c. constantly for sale at the *Dunlop Powder Store*, No. 65 Broad street.—By E. COPELAND, Jr.
[The De Pont shot as above, is warranted first quality, and is marked "E. Copeland, Jr. Boston," on the head of the case. m16 March 14]

Landreth's Nurseries.—Near Philadelphia.
From the patronage already extended this Establishment, by the citizens of Boston and its vicinity, the Proprietors are again induced to advertise to them their Nurseries, as offering peculiar facilities for the acquirements of useful & ornamental vegetable productions. The collection now cultivated by them, consists of an immense variety of Fruit and Hardy Ornamental Trees and Shrubs—Green-house Plants—Ballroom Trees, and Garden Seeds. The assortment of Fruits is not surpassed in real value by any in this country. It embraces most of the celebrated kinds of Europe, with all the esteemed varieties which have originated on this continent. The utmost care has been observed in making the selection, and the whole is now offered as containing more, but those most worthy of cultivation. Persons not acquainted with the different varieties by name, and desirous to procure choice kinds, by merely stating the fine they wish them to ripen, may confidently refer the rest to the proprietors, without a fear of disappointment.

The Ornamental department is rich in native and exotic Plants of various kinds, a splendid collection of Green-house Plants, most of which are calculated for adorning in the winter seasons, parlours, sitting rooms, &c. with an assortment of Hardy Flowering Shrubs, and acquisitions are continually making.
In the portion of ground allotted to Garden Seeds are grown almost every variety of Esulent Vegetables for sowing. The method pursued by the Proprietors in this branch, certainly must obtain for them a preference with all who will consider the subject in the slightest degree. The preparation of those kinds liable to mix in seeding—in short, the whole process of cultivation, in gathering, &c. all being under their own personal superintendance undoubtedly conspires in an eminent degree, to obviate the errors and impositions, unavoidable in a dependence on foreign importations, or on careless or inexperienced growers at home. Orders received by Ficker & Colman, No. 31 Congress St. Boston, of whom priced catalogues of the whole may be had gratis. Persons ordering, may be assured of having every article well and safely packed and forwarded.
Feb. 15. D. & C. LANDRETH

Tarragon Seeds.

For sale at the New England Farmer Seed Store, a few roots of this herb, (growing in pots.) used in soups, salads, &c. price 50 cts. per pot. Likewise roots of the "Lives, in pots, price 1/2-1 cts. per pot.

Bull, Young Comet
This noble animal, (of the new improved Durham Short-horned stock) is from *Abigail* and *Amabella* presented to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Collins, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in this State. He will remain at the farm of E. H. Pease, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be used at \$3 for each cow, payable in advance. The whole proceeds from this animal, (the present season) will be for the benefit of the Society. Cows sent from a distance will be taken care of if desired, at a reasonable charge.

ROMAN.

A very elegant, full-blooded horse, imported with a hope of improving the breed, will stand this season at the farm of Mr. Stephen Williams, in Northborough, county of Worcester.

Roman was purchased in England of the Earl of Warwick, and his pedigree has been traced in the New Market Stock-book from Childers, the swiftest horse that ever ran over New Market course, through eight generations of the highest blood-horses and mares in England, without a single drop of inferior blood. At 4 years old he won 5, and at 5 years old he won four prizes, and has since beat some of the fleetest horses in England over the most celebrated courses.

His colour a very bright bay—black legs, mane, and tail—his neck and chest very clean—very good tempered—high spirited—active—full blown and a hard headed high, and is considered by judges as handsome and well formed a horse as can be found in the country.

Mares have been sent to him from all the New England States, as well as from the remote counties in this State and the neighbouring towns, and his colts are handsome and command high prices.

Terms, \$20 the season, to be paid before the mares are taken away. Northborough, May 16, 1823.

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in papers of 1/8 and a quarter—cents each—very choice—done up in packages comprising 20 varieties, each sort being included, at \$1 per package.

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

The art of conversation is not much better understood by the greater part of mankind, than that of calculating eclipses. In ordinary society, you are usually annoyed by interminable stories, relating to the speaker's private concerns, including perhaps a bulletin of the narrator's health or want of health, with disorders topical and symptomatic. Or, if the orator with arguings minuteness. Or, if the orator happens to choose a different topic, you are teased and tantalized by arguments and assertions inspired by the spirit of contradiction, or a love of paradox, in which victory and the display of intellectual superiority are the manifest main springs of the tongue's perpetual motion. The object of conversation should be to amuse or benefit the hearer, not solely to display the talents and accomplishments of the speaker.

Conversation may be public or private, and many things may be said in a private interview, with perfect propriety, which would justly cause offence if uttered before company. No man is willing to have his faults, frailties, weaknesses, errors or deficiencies carpiped upon, or even pointed out before auditors more especially strangers. It may be a proof of friendship to speak of faults and follies to the person who commits them, but to publish them to others is an act of hostility which nothing but a desire to prevent (not make) mischiefs can justify.

Thumping Dividend.—Under this head, an eastern editor ranks 52 per cent per annum on Insurance stock, and the arrival of three children at a birth.

A lady named Mrs. Fortune, lately in London, presented her husband with three female twins (as paddy would say) at a birth. This is a striking proof of the old adage—"Miss fortunes seldom come single."

Early Rising.—Young Ladies would you improve your minds?—know that the morning is the best time to study. Would you improve your beauty?—know that the morning air is the best cosmetic.—Would you enjoy pleasure without alloy? know that the sun rising from his yellow couch, presents one of the most sublime and beautiful scenes of nature. Would you delight your eyes and regale your olfactorys?—know that flowers are clad in the best attire, and send forth the sweetest perfumes in the morning. Finally, would you attend a morning school?—get up at four o'clock.

A Rock Fish, *alias* Streaked Bass, weighing one hundred and ten pounds, was caught in the river Delaware, opposite Billingsport, N. J. on the 26th ult.

We have heard of many instances whereon fright it is said, has produced very strange effects upon the human system. The following account we give upon the authority of a highly respectable medical gentleman resident in London. At the time of the funeral of his late Royal Highness the Duke of York, a gentleman well known for his antiquarian researches, whose name we withhold, descended into the Royal cemetery at Windsor, after the interment had taken place, and busily engaged himself in copying inscriptions from various coffins. While thus engaged, and absorbed in thought

he heard the door of the cemetery close with an appalling sound, the taper fell from his hand, and he remained petrified by the knowledge of his awful situation, entombed with the dead. He had not the power to pick up the taper, which was soon extinguished by the noisome damp, and he imagined that the cemetery would not be re-opened until another royal interment should take place—and then he must soon form the effects of famine, be numbered with the dead. He swooned, and remained insensible for some time. At length recovering himself, he rose upon his knees, laid his hands upon a mouldering coffin, and to use his own words, "felt strength to pray." A recollection then darted across his mind, that he had heard the workmen say, that about noon they should revisit the cemetery, and take away some plumes, &c. which they left there. This some what calmed his spirits. Soon after 12 o'clock he heard the doors turn upon their grating hinges, he called for assistance, and was soon conveyed to the regions of day. His clothes were damp, and a horrible dew hung upon his hair, which in the course of half an hour turned from black to grey, and soon after to white. The pain which he felt in the scapula during the period of his incarceration, he described to our informant to be dreadful. This is perhaps, the best authenticated account upon record of a man's hair turning grey from fright.—*Macleesfield Courier.*

HEALTH.

The foundation of all health is regularity in the time and quantity of food taken and in the common evacuations. If these are strictly attended to, every thing will go on well; if suffered to become irregular, every thing will go wrong. The stomach is the *primum movile*, as it were, of the constitution; the cause when disordered, of the most afflicting diseases, and the first thing to be restored in order to their cure.—*Loudon.*

Female Education.—The branches of literature most essential for a young lady in this country, appear to be,

1. A knowledge of the English language. She should not only read, but speak and spell it correctly; and, to enable her to do this, she should be taught the English grammar, and be frequently examined in applying its rules in common conversation.
2. Pleasure and interest conspire to make the writing of a fair and legible hand, a necessary branch of a lady's education—on this head I have only to add, that the Italian and inverted hands, which are read with difficulty, are by no means accommodated to the active state of business in America, or to the simplicity of a republican.

3. Some knowledge of figures and book-keeping is absolutely necessary to qualify a young lady for the duties which await her in this country. These are certain occupations, in which she may assist her husband with this knowledge, and should she survive him, and agreeable to the custom of our country, be the executrix of his will, she cannot fail of deriving immense advantage from it.

4. An acquaintance with geography, and some instruction in chronology, will enable her to read history, biography and travels, with advantage, and thereby qualify her, not only for a general intercourse with the world, but to be an agreeable companion for a sensible man. To these branches of knowledge, may be added, in some instances, a general acquaintance with the first principles of

astronomy, natural philosophy, and chemistry, particularly with such parts of them as are calculated to prevent superstition, by explaining the causes, or obviating the effects of natural evil, and such as are capable of being applied to domestic or culinary purposes.

New Agricultural Books.

Just received at the New England Farmer Seed Store, from Loudon, a further supply of standard works on agriculture, horticulture and floriculture, of the latest editions; among which are,

An Encyclopedia of Gardening; comprising the Theory and Practice of Horticulture, Floriculture, Arts, Nurture and Landscape Gardening, including all the latest Improvements; A General History of Gardening in all Countries; and a statistical view of its present state, with Suggestions for its Future Progress, in the British Isles. By J. C. Loudon F.L.S. U.S. &c. Illustrated with many hundred Engravings on wood, by Braithwaite.

An Encyclopedia of Agriculture; comprising the Theory and Practice of the Valuation, Transfer, Laying out, Improvement, and Management of Landed Property; and the cultivation and economy of the Animal and Vegetable Productions of Agriculture, including all the latest Improvements; a General History of Agriculture in all Countries; and a statistical view of its present state, with Suggestions for its future progress in the British Isles. By J. C. Loudon F.L.S. U.S. &c. Author of the Encyclopedia of Gardening. Illustrated with upwards of eight hundred Engravings on wood, by Braithwaite.

The Science of Horticulture; comprising a practical system for the Management and Training of Fruit Trees, exemplified by sketches, from trees actually trained. Also a Comparative Investigation of the Foundation and Application of the Physiological Principles of Mr. Kew, Sir Humphry Davy, Mr. Robinson, and Messrs. Hill Forsyth, and Knight's Second Edition. To which are added, an Essay on the Cultivation of the Fine Apple, describing and exemplifying by sketches, an Improved Arrangement for furnishing every necessary Degree of Heat by Steam, and of applying it to every required Purpose, the results of a course of Experiments in growing Peaches and Pear-apples in pots, in a conservatory. By Joseph Hayward. Second Edition.

The Fruit Grower's Instructor; or a Practical Treatise on the Cultivation and Treatment of Fruit Trees; containing a description of the Apple Tree, commonly called the American Blight, which causes the Canker on Apple Trees, with an Effectual Remedy. By G. Biss.

A Treatise on the Improved Culture of the Strawberry, Raspberry, Gooseberry and Currant; in which are pointed out the best methods of obtaining ample crops of these fruits. To which are prefixed Descriptions of the most successful Varieties. Third Edition, with colored plates. By Thomas Haynes.

The Green House Companion; comprising a general course of Green-House and Conservatory Practice throughout the year; a Natural Arrangement of all the Green-House Plants in cultivation; with a descriptive catalogue of the most desirable to form a collection, their proper soils, modes of propagation, management, and references to botanical works in which they are figured. Also the proper treatment of flowers in rooms, and bulbs in water glasses. Second edition.

A Treatise on the culture and management of Fruit Trees; in which a new method of pruning and Training is fully described. To which is added, a new and improved edition of "Observations on the Diseases, Defects, and Injuries, in all kinds of Fruit and Forest Trees;" with an account of a Particular Method of Cure, published by order of government. By William Forsyth, F.R.S. and F.S.A. gardener to his Majesty at Kensington and St. James's, Member of the Economical Society at St. Petersburg, &c. &c. The seventh edition, corrected, with additions of new Fruits, and references to their figures; also a calendarary index.

The Florist's Directory; or a Treatise on the Culture of Flowers; to which is added, a Supplemental Dissertation on Sols, Manures, &c. By James Maddock, Florist. A new edition, improved; with notes and an appendix on the culture of the Dahlia, Chrysanthemum, Lobelia, and Free Mignonette. By Samuel Curtis, Editor of Lectures on Botany, &c.

Hortus Grammanus Walpole's, or, an Account of the Results of Experiments on the Productive and Nutritive Qualities of different Grasses and other Plants used as the food of the more valuable domestic animals. Instituted by John, Duke of Bedford upon which experiments have been made, and practical observations on their natural habits, and the soils best adapted for their growth; pointing out the lands most profitable for permanent pasture, irrigated meadows, dry or upland pasture, and the alternate husbandry; accompanied with the Discriminating Characters of the Species and Varieties. By George Sinclair, F.L.S. F.H.S. Third edition.

Sweet's Hortus Britannicus, or, a Catalogue of Plants cultivated in the gardens of Great Britain; arranged in natural orders.

A Concise and Practical Treatise on the Growth and Culture of the Carnation, Pink, Auricula, Polyanthus, Ranunculus, Tulip, Hyacinth, Rose, and other flowers; including a Dissertation on Soils and Manures, and containing catalogues of the most esteemed varieties of each flower. By Thomas Hogg, Florist. Third edition.

NEW ENGLAND FARMER.

No. 46.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

DRAINING.

Mr FESSENDEN—I have observed in New England and elsewhere, an abundance of land rendered of little value by being constantly saturated with water, issuing from springs from the sides or bottoms of hills. These lands being susceptible of great improvement by effectual draining, I have thought it might be useful to say a few words on the subject.

Open ditches are useful in carrying off surface water from low and flat lands, but fail when applied to lands impregnated with springs, and of an uneven or inclining surface. Besides, open ditches are liable to be filled up, and if of unusual depth, are in several respects an impediment to cultivation.

Having successfully adopted the mode of draining treated of under the article "Agriculture" in the Edinburgh Encyclopedia, and denominated, if my memory is correct, *Trench drains*, I would strongly recommend it as effectual in the end, the cheapest, and in various ways advantageous.

Lands constantly wet by spring water cannot be cultivated, and only produce inferior grasses. When reclaimed they will be found rich and productive.

Economy being essential in husbandry, it is desirable to combine various improvements in one operation.

The advantages of *Trench drains* are three.—First, they operate effectually as a drain—relieve the surface of small stones, and by collecting the water at one point, afford permanent resources for animal and other purposes—while this sort of ditch is out of sight and neither occupies land, or impedes the plough or carriages. In determining the route of the drain, attention should be paid to the *indication of springs*; and in order to intercept them, it will be found best to cut rather below than above those external indications, the appearance of water and the character of vegetation are the criterions to be noticed—a gradual descent most of course be maintained, in all draining.

After examining my grounds carefully in wet and dry seasons, I stake out the route of the drain, then cause two or three furrows to be ploughed as the width may require, the sods and loose earth being shovelled out, the plough may be again employed which forwards the work, after which the shovel, spade and pick axe must finish the excavation. The depth generally makes from thirty to forty inches, according to circumstances; the width twenty-four to thirty at top, sloping to about two-thirds the width at bottom.

The ditch being made ready to fill and the stones brought to its margin, let one man, being in the ditch, carefully place the bottom stones (of the size of six or eight inches through if round,) in the manner of an *arch*, leaning two against each other at top, the bottoms extending to open a free passage for water beneath, let these bottom stones be firmly kept in place by key stones, after which the stones may be thrown in somewhat pro-

miscuously to within ploughing distance of the surface. The larger stones should be at bottom to give a free passage to the under water, the smallest stones at top to prevent the earth and surface water getting in. The stones in, and levelled, spread a little swingle tow, shavings or straw, over them, for the reason named above, after which the plough will replace the earth expeditiously, and the top of the ditch should present a ridge higher than the general surface, as it will settle; and a heavy roller tow, passed several times lengthwise the ridge, will give the whole a handsome and fine finish. If it be a meadow, or pasture, grass seeds may be sown and harrowed in, which will soon leave no trace of a ditch, except it be from its beneficial effects.

I have been more minute than may be deemed necessary in describing so simple an operation, but as the improvement contemplated, if well made, will endure for centuries, and carelessly attempted, may fail in one year, this particularity may be allowable.

H. W. D.

Ballston, (N. Y.) May 26, 1828.

FOR THE NEW ENGLAND FARMER.

GARDENING.

Mr. FESSENDEN,—I have been pleased to see in the New England Farmer, an extensive advertisement of garden seeds for sale. From my most early remembrance, I have ever been fond of gardening. The eminent Dr Darwin says he had been an experienced gardener forty-five years. I can now say more than that, as I have had more less or experience in gardening for sixty years or upwards. According to the course of nature, at this advanced period of life, little more may be expected from me, except a few observations on my experience.

It is now forty years since I first came to make a garden at this place. I was then well provided with a great variety of seeds. Water melons I had from a very large one that came from the Island of Bahama, of another kind from Charleston, S.C. and a parcel from my native county of Bucks thirty miles north of Philadelphia. They were all planted, and tended equally well; the vines of those from Bahama grew the largest I ever saw; they blossomed in abundance but never bore any thing. Those from Charleston grew well, and blossomed, but bore none to perfection. Those from Bucks county grew well and produced abundance of good melons; so did my cucumbers, muskmelons, squashes, &c. but they all depreciated in size, and quality every year.

Sometime after, I had business at Fishkill, opposite Newburgh, it being the season for gathering garden seeds, my worthy friends D. Verplank Esq and the widow De Witt, furnished me with an assortment; and from several years' experience, they apparently grew better than such as I raised on the soil or obtained from Philadelphia. Upwards of twenty years ago a forlorn traveller came to my house and begged for victuals. He was dressed altogether in skins with the hair on. He informed me in substance that he belonged to Lower Canada, near the United States, had been with the traders up Lake Superior, and had resid-

ed several years with the Indians on the river Onasconsin. That they had beans growing spontaneously in the woods, of a superior quality. It was in the early part of the month of June, and he gave me six beans. They were a beautiful glossy white bean, more than twice as large as any I had ever seen. I planted them—they grew and bore well—were different from other beans, with long vines, strong stems, with pods, blossoms, &c. from the same stem until frost. These beans, depreciated in size until the year 1810, when I planted and gave away all that I had; but there were so many frosts that they were all cut off, and I believe are extinct.

With regard to water melons, in the summer of 1813 I was in the city of Philadelphia, and informed of a certain man living nearly opposite, in New Jersey, that supplied the city with the best water melons. I sought his residence, they were different in shape from any I had seen, very crooked and small to the middle, so much so that I carried one to my lodgings by hanging it on my shoulder. They were of a very superior flavor.—I forget the name of the Sandwich Island from which he said the seed came; but I bought two for the seed, and only found a few in the blossom ends. I carefully preserved and brought the seeds here, but never could raise one to ripen.

He told me one thing about raising water melons, and other similar vines, that may be of service,—that in the summer he gardened, and in the winter fattened sheep, and always kept them on his water melon patch, and was never troubled with any worms or yellow bugs.

Doctor Darwin the great friend of Doctor Franklin, in his directions for raising Brocoli, recommends to have the seed every year imported from Italy. Is not that a proof, as Italy is to the south of England, that transporting seed from south to north, doth not answer a stationary purpose?

Perhaps you may think I am too late with my remarks; but I am not too late for gentlemen's observations and remarks for another year. One in particular in your neighborhood, my worthy friend, the venerable Col. TIMOTHY PICKERING; I hope to see something more from him in your paper.

SAMUEL PRESTON.

Stockport, May 26, 1828.

N. B. I am feeble with age and bad health, yet life and health permitting, I hope to write a history of the *Apple Tree*, and show that it was a native of Pennsylvania long before the continent was discovered by Europeans; and if I had means of conveyance, would send your agricultural friends, a scion of the original apples; they are yet worthy cultivating, and I have them in abundance.

ON BEE KEEPING.

Many and great are the advantages to be gained by the inhabitants of these United States, if bees were propagated, supported, and preserved. Our soil and climate are inferior to none for this purpose. Not Egypt, Greece, Italy, Germany, France, England, or any part whatever of the whole globe, would exceed us in the quantity, quality, or flavor of the honey. Canaan, of old, could not with more propriety be called a land flowing with milk and honey, than America would

he, did we but improve all the means to produce these so valuable and so important articles, which we might do very easily; which would assist each other when we annually extended such pastures as would increase both.

Bees-wax for manufactures, candles and exportation, will be a great motive to exertion, and perhaps emulation in this system; especially was a bounty given upon it by government. Wax candles would then be sold as cheap as tallow, and the quantity of wax, in American exports, would be very great indeed.

A writer observes, that were bees propagated, and supported as extensively as a country would bear, innumerable insects would be destroyed, which feed upon the honey in the bloom of trees, shrubs, and herbs; and that this would tend to expel those hosts of insects, which we observe floating in the air, playing in the rays of the sun, near the time of its setting, many of which we are in danger of receiving into our bodies by respiration, because of their smallness.

If these observations are just, will not the increasing of bees assist in expelling the caterpillar and canker-worm, which have so often destroyed the fruit of the apple tree; whose young often feed upon that part of the bloom, from which the bees collect the yellow down, which they carry into their hives on their legs.

This point could be easily decided by those persons who have trees near their bee-houses, or in those parts of the country where bees are most frequent. Should the knowledge of any one prove this to be a fact, that such trees are less frequently, or never attacked by these ravagers, the world ought to be favored with the information.

Insects often feed upon that moisture, which many trees, especially the chestnut, afford in very sultry days, in summer, which the bees collect with great activity; this is sometimes called honey dew, and is the sweet sap of the tree sweating through the leaf, and becomes honey; which, if more generally collected by bees, would thereby serve to expel those troublesome and noxious insects.—*Agricultural Register.*

KITCHEN GARDEN—JUNE.

Sowing and planting are still requisite in many successional, and some main crops for autumn and winter; and in the crops now advancing, or in perfection, the business of hoeing, weeding and occasional watering, will demand particular attention.

Planting is now necessary in several principal plants, for general succession summer crops, and main crops for autumn, winter, &c. The whole in the open ground, except two articles, and those are cucumbers, and melon plants for the last crop in hot bed ridges.

In the open ground transplant cabbage, broccoli, savoy, coleworts, celery, onion, lettuce, cauliflowers, leeks, beans, kidney beans, and various aromatic and pot-herbs, by slips, cuttings, or young plants. Showery weather is by far the best either for sowing or planting; and when it occurs lose no time in putting in the necessary crops waiting.

Keep your asparagus beds very clear from weeds now commonly using numerous therein, which will soon overspread, if not timely cleared out.— Likewise new planted asparagus, and seed-beds, should be carefully weeded. Cut the asparagus now in perfection, according as the shoots advance, three, four, or five inches high: which you may continue to do all this month.

Plant successional crops of beans in the beginning, middle, and latter end of this month, some Windsors, long peas, white blossom, and Mumford kinds, or any others. If the weather is very hot and dry, soak the beans a few hours in soft water before you plant them. Hoe those of former planting, and draw the earth to the stems. Top those that are in blossom.

Your early cauliflowers, which will be now advancing in flower heads, must be watered in dry weather to make the heads large; and according as the heads show, the down some of the large leaves over them, to keep off sun and rain, that they may be white and close.

The first main crops of celery must be now planted in trenches to blanch; the trenches to be three feet distance, a foot wide, and dig the earth out a spade deep, laying it equally to each side in a level order, then dig the bottom, and if poor and rotten, dung, and dig it in. Draw up some of the strongest plants, trim the long roots and tops, plant a row along the bottom of each trench four or five inches' distance, and finish with a good watering.

In the beginning of this month sow a full crop of cucumbers in the natural ground to produce picklers, and for other late purposes in autumn; allotting a compartment of rich ground dug and formed into beds five or six feet wide; and along the middle, form with the hand shallow basin like holes, ten or twelve inches wide, one or two deep in the middle, and a yard distant from each other; sow eight or ten seeds in the middle of each half an inch deep; and when the plants come up, thin them to four of the strongest in each hole to remain. Be careful frequently to water them when the weather is dry.

Sow the main crops of the green-curl'd endive, also a smaller supply of the white-curl'd, and large Batavia endive; each thin in open ground to plant out for autumn and winter.

Clear your onions from weeds, and give them a final thinning, either by hand, or small hoeing;—the main crops to four or five inches distant; the others, designed for gradual thinning in summer leave closer, or to be thinned by degrees as wanted.

Sow more marrowfat peas, and some hotspurs, or imperials, and other large kinds. This is also a proper time to sow the leadman's dwarf pea, which is a great bearer, small podded, but very sweet eating. If the weather is very hot, either soak the seed, or water the drills before sowing.

Hoe between your potatoes to kill the weeds and loosen the ground; and draw the earth to the bottom of the plants.

Thin all close crops now remaining to transplant proper distances. Many sorts will now require it, as carrots, parsnips, onions leeks, beets, spinach, radish, lettuce, turnip, turnip-radish, parsley, dill, fennel, &c all which may be done by hand or small hoeing; the former may do for small crops, but for large supplies the small hoe is not only the most expeditious, but by loosening the surface of the earth, contributes exceedingly to the prosperity of the plants.

IMPORTED HORSES.

We understand the two fine thorough-bred imported Horses, *Barfoot* and *Scrab*, with their grumps, sent under the care of Mr Hector Coffin, in the packet-ship *Napoleon*, Capt Smith, to New-York, by Admiral Sir Isaac Coffin, Baronet, have arrived at the stables prepared for them in Brighton,

near Boston: where they are to remain this season, but will be placed in Virginia or New-York the next. The income from these horses is to go to the benefit of the Annual's School at Nantucket.

The horses are perfect in body and limbs; without a defect or blemish of any kind. They have both been famous on the turf of England; and *Barfoot*, since he took the Doncaster Saint Ledger stakes, against 84 horses, at 25 guineas each, has never been beaten till he left the turf. He was then 4 years old; previous to which he had run four colt races, at 2 and 3 years old, always beating. *Scrab* won the Newmarket stakes at 3 years old, 25 horses, at 50 guineas each; and many others. For this horse the Marquis of Cleveland (then Earl of Darlington) gave £3,000 sterling.

Finer horses never were bred in England, or ever left that country; their pedigree goes back in a direct line, to the first blood recorded in the sporting calendar of England. A better opportunity for improving the breed of horses in this country, has never been afforded; and it is to be hoped the gentlemen and farmers of old Massachusetts will avail themselves of this opportunity, the present season, as, by the removal of the horses south, they will be deprived of it the next.

Newburyport Herald.

VITIATED ATMOSPHERE FROM VEGETATION.

As the spring advances, and vegetation puts on its attractive garb, it may be proper to caution our readers against the too general custom of allowing geraniums and other ornamental green house plants, to vegetate in confined rooms in dwelling-houses. The process of vegetation destroys the purity of the air in a remarkable degree, by absorbing the oxygen of the atmosphere, and giving out the refuse carbon, or *fecula* of the plant to the surrounding air. The odoriferous plants, though agreeable to the olfactory nerves, are even more deleterious than any others, from the gaseous carbon evolved in the form of aroma. Apartments in which any kind of plants are allowed, ought, therefore, to be constantly ventilated, both for the purpose of respiration, and for the health of the plants.—*Verulam.*

HORTICULTURAL INSTITUTION.

Agreeably to public notice, the Horticultural Society of Philadelphia, met on Wednesday evening, and elected the following gentlemen Officers.—*President*, Horace Binney, *Vice Presidents*, James Mease, M. D. Matthew Carey, David Landreth, N. Chapman, M. D. *Treasurer*, Wm. Davidson, *Corresponding Secretary*, Samuel Hazard, *Recording Secretary*, D. S. Brown, *Acting Committee*, George Pepper, Nicholas Biddle, Thomas Biddle, R. Patterson, D. B. Smith, Moses Brown, M. C. Cope, Thomas Astley, David Landreth, Jr. Thomas Hibbatt, Thomas Landreth, Joshua Longstreth.

THE THAMES TUNNEL.

A third irruption has taken place. Within the last week, the leakage had been considered so effectually remedied, as to permit the pumps being set to work to draw off the water. This was done, and the shaft and parallel passages were so far emptied as to admit one of the engineers reaching the shield and examining the greater part of the boxes. The result of that examination was

such, that the most sanguine anticipations were entertained that the works would be speedily resumed, and even a particular period was named for putting on the full force of the workmen.—The recent irruption took place between one and two o'clock on Sunday morning, but was not so sudden as the preceding one. During the afternoon of that day several bags of clay were thrown down, over where it is thought the aperture has taken place, but until a meeting of the Directors has been convened, to announce to them this additional calamity, more active measures will not be adopted. It has been ascertained that the depth of earth over what were the thinnest parts through which the Tunnel was directed, was sixteen feet six inches. The flowing in of the water was gradual, and on its being perceived by Mr Gravatt, he gave directions to the workmen to watch beyond the wier, which was graduated, and when they perceived any increased flow arising, to retire immediately.

Lady Hervey, formerly Miss Coton of Baltimore, and sister to the Marchioness Wellesley, was married on the 25th of April to the Marquis of Carmarthen. The elevation of those two ladies is quite remarkable.

Plants on an acre.—An acre planted with corn or potatoes, the hills being two and a half feet apart each way, measuring from and to the centre of the hills, and supposing them at right angles, will contain 6,939 hills—if the hills be three feet apart, it will contain 4,840 hills—if three and a half feet apart, 3,556 hills—if four feet apart, 2,722 hills. An acre with plants placed at the distance of one foot each way will contain 43,560 plants—at the distance of eighteen inches, 19,360 plants. An acre of fruit trees placed twenty feet apart, will have 108 trees—placed twenty-five feet apart, 69 trees—placed thirty feet apart, 43 trees.

To make beer.—Three quarts of molasses—half a pound of hops—a quarter of a pound of ginger, and an ounce of cloves, brewed with a sufficient quantity of water, will make half a barrel of excellent family beer.

BOLIVAR'S PEDIGREE—TRACED IN THE HERD BOOK.

BOLIVAR, red and white, calved May 5, 1825, bred by J. Whitaker, Esq. England.
BOLIVAR, by Frederick, dam Sweetheart by Hermit.
 g. d. Buxom, (bred by R. Colling) by Lawnsleeves.
 g. g. d. Brampton, (bred by R. Colling) by Favorite,* the sire of Comet.
 g. g. g. d. Brighteyes, (bred by R. Colling) by Favorite.
 g. g. g. g. d. Old Brighteyes (bred by R. Colling) by Favorite.
 g. g. g. g. g. d. by Favorite.
 g. g. g. g. g. d. by Punch.
 g. g. g. g. g. d. by Hubback.
 g. g. g. g. g. d. by Snowdon's Bull.
 g. g. g. g. g. d. by Masterman's Bull.
 g. g. g. g. g. g. d. by Waistell's Bull.—Waistell's Bull by Masterman's Bull, Masterman's Bull by the Studley Bull.

Frederick, the sire of Bolivar, roan, (bred by Mr Charge) got by Hulton, dam Orbit by Comet; g. d. Splendor by Comet; g. g. d. Fleck'd Twin by Mejur; g. g. g. d. Red Simon by Favorite; g. g. g. d. Fleck'd Simon by Bartle; g. g. g. g. d. Old Simon (bred by Mr Charge) descended from the Studley White Bull.
 Hermit, roan, (bred by Mr Baker) got by Lann-

sleeves, dam Manuscript, by Simon; g. d. by Daisy,* g. g. d. by Duke; g. g. g. d. by Bolingbroke.

Lawnsleeves, got by C. Colling's Surplice; dam by George; g. d. by Simon.

Favorite, the sire of Comet, by Bolingbroke, dam Phenix by Foljambe,* g. d. Favorite, by R. Alcock's bull; g. g. d. by Smith's bull; g. g. g. d. by Jolly's bull.*

Punch, (bred by Mr R. Colling) got by Broken Horn, dam by Broken Horn; g. d. bred by Mr Best.

Hubback, calved in 1777, (bred by Mr John Hunter) got by Snowdon's Bull,* dam, (from the stock of Sir James Pennyman, and those from the stock of Sir William St Quintin, of Scampston.) by a bull of Mr Banks, of Hurworth; g. d. bought of Mr Stephenson of Ketton. Hubback's dam Barforth was the best butter cow upon record in England.

Snowdon's Bull, the sire of Hubback, (bred by Mr George Snowdon) got by Robson's Bull.*

Masterman's bull,* by the Studley Bull.
 Waistell's bull,* by Masterman's bull.

Simon got by Favorite; dam by Punch; g. d. by Bolingbroke.

Daisy Bull, (bred by Mr C. Colling) got by Favorite; dam by Punch; g. d. by Hubback.

Duke, by Comet, dam Duchess by Favorite; g. d. by Daisy; g. g. d. by Favorite; g. g. g. d. by Hubback; g. g. g. g. d. by James Brown's Red Bull.

Bolingbroke, red and white, calved Nov. 12, 1788, (bred by Mr Charles Colling,) got by Foljambe, dam young Strawberry (bred by Mr Maynard) by Dalton Duke; g. d. Favorite, (bred by Mr Maynard) by R. Alcock's bull; g. g. d. by Mr Jacob Smith's bull; g. g. g. d. by Jolly's bull.

Surplice, (bred by C. Colling) got by Favorite; g. d. Phenix by Foljambe; g. g. d. Favorite, by R. Alcock's bull.

George, (bred by Mr C. Colling) got by Comet; dam Lady by grandson of Bolingbroke; g. d. Phenix by Foljambe; g. g. d. Favorite, bred by Mr Maynard) by Alcock's bull.

Comet, (sold for 1000 guineas) red and white roan, calved in 1814, (bred by Mr C. Colling) got by Favorite, dam young Phenix, by Favorite; g. d. Phenix by Foljambe; g. g. d. Favorite, (bred by Mr Maynard) by Alcock's bull; g. g. g. d. by Smith's bull; g. g. g. g. d. by Jolly's bull.

James Brown's Red Bull,* got by Barker's bull.

Foljambe, white with a few red spots, calved in 1787, (bred by C. Colling) got by Richard Barker's bull, dam Haughton by Hubback; g. d. by a bull of Charles Colling; g. g. d. by Waistell's bull; g. g. g. d. Tripes, (bred by C. Pickering.)
 R. Alcock's Bull, bred by Jackson.

Grandson of Bolingbroke, (bred by C. Colling) got by O'Callaghan's Son of Bolingbroke, dam old Johanna, by Colling's Lame Bull.

* The best milkers have descended from the *Deirus*, *1* *ach*, *sses*, and *Widlers*. The *Studley Bull*, *Hubback*, *Foljambe*, and *Favorite*, were the most celebrated bulls of their day—from them have descended the very best animals of the race—to them the breeders are most anxious to trace the origin of their Short Horn stock, and it will be found on reference to the Herd Book, that *Snowdon's*, *Robson's*, *Waistell's*, *Brown's*, *Barker's*, *Smith's*, *Jolly's*, *Alcock's* and *Masterman's* bulls were the males from which these bulls were derived.

In proof see "Improved Short Horns, and their Pretensions," Mr Colling's remarks, and "Hints for American Husbandmen." "The Pennsylvania Agricultural Society unequivocally declare the Improved Durham Short Horns to be "the race of neat cattle which experience has proved to be superior to all which we have ever seen."

A profitable cow.—A cow belonging to John H. Powel, Esq. (near Philadelphia,) of the Durham short-horned breed, gives daily, *twenty six quarts of milk in 24 hours*; which produces *twenty and a half pounds of butter per week*. The feed of this cow is slops of corn meal, lucerne, and orchard grass.—*American Mercury*

Cows.—We are told that the Rev. Mr. Phenix of Springfield, (Chickopee,) has made for some weeks past, on an average twenty pounds of butter a week from two cows, besides using as much milk as was necessary for his family. This shows the advantage of good cows and good keeping.—*Hamp Gaz.*

A Milledgeville paper states, that the price of corn is rising in different parts of Georgia, particularly in the new counties. The price at Columbus is said to be *two dollars and a half* per bushel—which is partly ascribed to the great influx of population, and partly to the scarcity among the neighboring Creeks, which approaches to a state of famine.—The price at Milledgeville does not exceed from 62½ to 75 cents per bushel.

Steamyard.—A new steamyard has been invented in France, which is said to possess greater accuracy than any description of that machine hitherto in use. One of the improvements in this new invention, is the ease with which it can be verified. The divisions, which are marked on the long arm of the beam, being from a zero point; that is, from a point at which the travelling weight places the machine in equilibrium, when no weight is attached to the short arm of the beam. This enables the most ignorant persons to judge at once of the correctness of its construction.

The Connecticut, swelled by the late rains, has covered a large portion of the meadows in this town with water, and destroyed the springing corn, oats, &c.—*Hamp. Gaz.*

The London Literary Gazette states that Capt. Foster will sail from England in the course of a few days, in His Majesty's Chanticleer, on a voyage of discovery to the South Pole. His extreme destination is the newly discovered group of the South Shetland Islands, but he has conditional instructions to proceed from thence as far as he can, without risk to his ship, towards the South Pole. Capt. F. was with Capt Parry in his last voyage, and is said to be a scientific man.

A new steam boat left New York, on the 17th inst. 'or Havana. Her boilers are of copper, and weigh 60,000 pounds.

Value of Mahogany.—A few days since, (says the Hampshire Gazette) we observed a man unloading a few mahogany boards from a wagon at a cabinet ware-house; and, on inquiring of the cabinet-maker how much his boards cost him, he informed us that he paid in Boston for twelve boards one inch in thickness, and containing about sixteen square feet each, \$42, and for freight upwards of \$6; making the whole expense of the boards, about four dollars each. This is at the rate of twenty five cents per square foot, or about seven cents per pound. We were further informed that all these boards, with many other valuable materials, are to be worked into one table, or rather, set of tables so formed that they can be united into one.

MERRIMACK AGRICULTURAL SOCIETY.

At a meeting of the Board of Directors of the Merrimack Agricultural Society, holden at the Phoenix Hotel in Concord, on Thursday, the 28th of February, 1828, the following gentlemen were appointed a Viewing Committee on farms, namely: R. H. Ayer, of Hooksett, Chairman—S. A. Kimball, of Concord—Wm. Little, of Hopkinton—A. Burbank, of Boacawan—P. Eaton, of Henniker—B. Pettengill, of 2d of Salisbury, and T. D. Merrill, of Epson.

Voted. That the next annual meeting be holden at London Village, on Wednesday and Thursday, the 15th and 16th days of October next, at 10 o'clock, A. M.

Voted. That no quantity of land less than twenty five acres, receive a premium as a farm.

Voted. That the following premiums be offered to be awarded at the next annual meeting, viz.

ON FARMS AND GARDENS.

On the best Farm \$12—next best, 10—next best, 8—next best, 6—next best, 4.

On the best Kitchen Garden, \$6—next best, 4.

Voted. To appropriate the sum of \$25 to be awarded on crops and improvements in the art of husbandry, including reclaimed meadows and the cultivation of the mulberry tree, which sum is to be at the disposal of the Viewing Committee.

Voted. That there be a ploughing match, and that a premium of \$4 be awarded on the yoke of cattle that will plough 1.3th of an acre in the best manner—and a premium of \$2 will be awarded on the yoke of cattle that will plough one eighth of an acre in the next best manner.

ON STOCK.

For the best pair of working Oxen, \$4—next best, 1 vol. N. E. Farmer.

For the best pair three year old Steers, accustomed to the yoke, \$3—the next best, 1 vol. N. E. Farmer.

For the best pair two year old Steers, \$2.

For the four best Yearlings, 1 vol. N. E. Farmer.

For the best Bull, over one year old, owned and kept within the county, \$4—next best, 3—next best, 3—next best, 1 vol. N. E. Farmer.

For the best Bull Calf, 1 vol. N. E. Farmer—next best, \$1.

For the best Milch Cow, \$4—next best, 3—next best, 1 vol. N. E. Farmer.

For the best three years old Heifer, \$3—next best, 1 vol. N. E. Farmer.

For the best two years old Heifer, \$2—the next best, 1.

For the best Stud Horse, owned and kept within the county, \$5—next best, 3.

For the best Mare and Colt, \$4—next best, 1 vol. N. E. Farmer.

For the best Saxon or Merino Buck, \$4—next best, 1 vol. N. E. Farmer.

For the five best Saxon or Merino Ewes, \$3—five next best, 1 vol. N. E. Farmer.

For the best Boar, \$3—the best Sow, 1 vol. N. E. Farmer—the two best spring Pigs, \$2—next best, 1.

ON DOMESTIC AND HOUSEHOLD MANUFACTURES.

On the best piece of Fulled Cloth, not less than 60 yds. \$3—next best, 1 vol. N. E. Farmer—next best, 1.

On the best piece of Cassimere, not less than 10 yds. \$3—next best, 1 vol. N. E. Farmer.

On the best piece of Carpet, not less than 25 yds. and 3 wide, \$3—next best, 2.

On the best piece of Flannel, not less than 10 yds. \$2—next best, 2.

On the best pair of Blankets, \$2—next best, 1.

On the best piece of Linen Cloth, not less than 10 yds. \$2—next best, 1.

On the best piece of Table Linen, not less than 10 yds. \$2—next best, 1.

On the best Woollen Hose, (2 pair,) \$1—next best, 50 cts.

On the best Woollen Coverlet, \$1—next best, 50 cts.

On the best Cotton and Woollen Coverlet, \$1—next best, 50 cts.

On the best Counterpane, \$1—next best, 50 cts.

On the best grass or straw Bonnet, \$2—next best, 1.

On the best manufactured Boots and Shoes, (2 pairs each) 1 vol. N. E. Farmer.

On the best manufactured Leather, 3 sides each, 1 vol. N. E. Farmer—the best Calf Skins \$1.

On the best specimen of dressing Fulled Cloth, 1 vol. N. E. Farmer.

On the best Break-up plough, 1 vol. N. E. Farmer—the best Seed plough, \$1—on the best Ox-yoke, haws and iron, 1—on the best Ploughman, 1—on the best Teamster, 1.

On the best specimen of Blacksmith work, 1 vol. N. E. Farmer.

On the best specimen of Cheese, not less than 46 lbs. 1 vol. N. E. Farmer—next best, \$1.

On the best specimen of Butter, not less than 20 lbs. 1 vol. N. E. Farmer—next best, \$1.

On the best Dissertation on making Compost Manure, 1 vol. N. E. Farmer.

Voted. That in all cases it is to be understood, that premiums will not be awarded when the articles are not deemed worthy of them.

Voted. That all persons who enter their farms for premiums must make application to the chairman of the viewing committee, or to the Secretary, prior to the twentieth of June next.

Voted. That the viewing committee on farms, in making their awards, will take into view the quantity and quality of mowing, arable, orcharding, pasture and wood land, compared with the size of the farm—the condition of buildings and fences—the amount of stock kept, the mode adopted in making and increasing the quantity of manure—the quantity and quality of crops compared with the labor bestowed, and the general neatness and economy attending the management of the farm.

Voted. That all the above named animals must be owned within the County of Merrimack, and by members of the Society at the time of exhibiting, and must not have received a premium elsewhere during the same year.

Voted. That all articles of domestic and household manufactures must have been made within the County, and within one year previous to the exhibition, and by or for the person offering the same.

Voted. That this meeting stand adjourned to the third day of September next, at 9 o'clock, A. M. at the Phoenix Hotel in Concord.

Attest, JNO. WHIPPLE, Sec'y.

From the Hampshire Gazette.

SILK.

We have received from Mr. Bates, a letter from the Secretary of the Treasury, in relation to the growth and manufacture of silk. It is a Manual containing the best practical information that could be collected from various countries respecting the cultivation of the mulberry tree, the breeding of silk worms, and the manufacture and dying of silk. This manual, of 220 pages, was prepared in obedience to a resolution of the House of Representatives, and is adapted to the different parts of the Union.

The silk worm is a native of China. The Seres, who inhabited the northern part of that country, cultivated the precious article. Having been expelled by the Huns, A. D. 93, they settled in Little Bucharina. Silks were first brought from China to Syria and Egypt by traders, who, in caravans, performed journeys of 243 days through the deserts of Asia. The price was far beyond the reach of any but the rich, and for a long time the use of silk among the Romans was confined to women of fortune. The Emperor Aurelian refused his queen a garment of silk, by reason of the high price it bore—its weight in gold. In the sixth

century, two monks, who had been employed as missionaries in the east, penetrated into the country of the Seres, and observed the labors of the silk worms, and the manner of working their production into elegant fabrics. They imparted the secret to the emperor Justinian at Constantinople, who induced them by a great reward, to return and bring away a quantity of the silk worm's eggs. They put the eggs into the hollow of a cane, and brought them safely to Constantinople about the year 555. The eggs were hatched, and the worms were fed with mulberry leaves; and the insects produced from this careful of eggs were the progenitors of all the silk worms of Europe and the western parts of Asia. The people of the Morea, and of the cities of Athens and Thebes enjoyed the profit of the culture and manufacture of silk upwards of 400 years; but in 1146 the king of Sicily made war upon Greece, and carried off a great number of silk weavers, who taught the Sicilians to raise silk worms and to weave silk stuffs. The Saracens introduced the silk manufacture into Spain and Portugal, and subsequently the Italian States, France, and England engaged in it.

In the United States, the culture of silk first commenced in Virginia. As early as 1666, the rearing of silk worms was a part of the regular business of many of the farmers. One man had 70,000 mulberry trees growing in 1664. Georgia sent eight pounds of raw silk to England in 1735, and 10,000 pounds in 1759. Some attention was paid to the culture of silk in South Carolina, and in 1755 Mrs Pinckney raised and spun silk enough for three complete dresses. In Pennsylvania and New Jersey the culture of silk began in 1771, but was suspended by the war of the revolution.

Mulberry trees and silk worms were introduced into Mansfield, in the county of Windham, Conn. about the year 1760, and in 1789 two hundred pounds of raw silk were made in that town. At present, three fourths of the families in Mansfield are engaged in raising silk, and make annually from five to ten, twenty, and fifty pounds in a family; and one or two have made, each, one hundred pounds in a season. It is believed that there are annually made in that town and the vicinity, from three to four tons of silk.

The cultivation of silk has commenced in Massachusetts, New York, Kentucky, Ohio, and several other States.

BOOK FARMING.

It is a prejudice, irreconcilable with the general intelligence, which characterizes our countrymen, that agriculture can be availingly promoted by those only whose talk is of oxen, and who are employed in their labors. The attention of Europe was awakened towards this essential department of human industry, by an English judge, who not only prescribed modes for bettering the condition of the land, but contrived implements of husbandry, inquired into the causes, and recommended a judicious treatment, of the diseases of domestic animals. He also gave plans for the improvement of farm buildings, and the embellishment of the long neglected estates of the kingdom. Sir Anthony Fitzherbert, to whom England owes so much for the revival of agriculture and rural taste, published two works on country affairs, about the year 1534. These volumes serve, among other testimony, to prove, that what might then have been regarded as idle theory, obnoxious to the ridicule of the ignorant, has since been universally adopted

from the seemingly insignificant conception of banding wheels with iron, and the simple contrivance for harnessing a team of horses, to the more extensive operations of reclaiming and cropping land, subjects which previously had not been suggested, much less gravely and ably recommended in a book. From the moral and economical advice which he imparted, I cannot forbear selecting a few lessons, as worthy of respect and obedience now, though almost 300 years have elapsed since they were first promulgated for the instruction of the farmer. "I would advise him," says Fitzherbert, "to rise by times in the morning, and go a bout his closes, pastures, fields, and specially by the hedges, and when he seeth any thing that would be amended, to write it in his tables, and if he cannot write, let him nick the defects upon a stick.—As if he find any beasts, sheep, or swine, in his pastures that be not his own, and peradventure though they be his own, he would not have them to go there. Let him look, if any water stands on his pastures, upon his grass, whereby he may take double hurt, both the loss of his grass, and rotting of his sheep and calves. And see if any gate be broken down, or findeth or seeth any thing amiss that should be amended. Also take heed, both early and late, at all times, what manner of people resort and come to thy house, and the cause of their coming, and specially if they bring with them pitchers, bottles, or wallets, for if thy servants be not true they may do thee great hurt, and themselves little advantage, wherefore they would be well looked upon."—*Faux's Address.*

ADVANTAGES OF CARROTS IN FAT-TENING OXEN, &c.

Nothing can exceed this root for fattening oxen; but they should have some sweet hay to eat with it, and they will thrive much better on it if they are stalled. It nourishes them much, and soon makes them fit for the butcher. Some oxen will not take to eating them kindly at first. For those they should for a time be parboiled; but they must every day be less and less boiled, till they come to eat them quite raw, which in a little while the nicest will do. I also find carrots excellent for increasing the milk of cows.

Hogs are very fond of carrots, and they make them thrive apace; but they should always be given to them boiled, as they will with great difficulty be induced to eat a sufficient quantity of them raw. It will be proper, however, to give them before they are killed, either a few bushels of barley meal, or some grey peas, boiled or some corn, which will complete their fattening to admiration.

There is not a better and more heartening food for horses than carrots, if given them with discretion. They need have no corn, and much less hay than they would otherwise eat. I have all my life heard it said, that carrots were exceeding good to make horses long winded; and some jockies will, I have been informed, feed a broken winded horse some little time with carrots before they sell him, when he may be very well passed off for a horse that is only a little thick winded.

A horse dealer in my neighborhood, when he buys a poor, half-starved beast, if he has youth on his side, always fats him up with carrots before he takes him to market; and this practice he finds answers very well, as the horse is sooner got into flesh with carrots than any other food; and they are besides wholesome, breeding in him no foul humours.

All the danger seems to be to the purchaser who, if he imprudently put the horse to too hard work, is in a manner sure to break either his wind or his heart; for as the horse was very suddenly got into flesh, his strength is not proportioned to his bulk, till he has been kept some time on dry meal.

That a horse thus fed should not be immediately fit for any hard labor, must not be used as an argument against carrots being a proper food for horses. It must be considered, that this man takes a half starved horse, and gives him at once his fill of a nourishing food; in fact, too nourishing, as it fills him with flesh faster than he can have time to gather strength.—*Agricultural Register.*

Rot in sheep.—In the parish of Cheriton Fitzpaine, the rot is very apt to be communicated to the sheep after depasturing upon the low lands subject to the wash and partial overflowings from the higher tillage lands. An instance once occurred in the parish, of a farmer turning one hundred and ten ewes upon a lay field in preparation to be sown with wheat, that had recently been dressed with a mixing of lime, hedge-row and other mould. The grass grew luxuriantly after this dressing, but every ewe was dead by the Candlemas following, being all cawed or rotted with innumerable flukes found in the liver of every one of them. The other sheep upon the farm, which had been raised, and in every other respect treated in the same manner, save in depasturing with the one hundred and ten ewes, were free from the most remote symptoms of this disease. Watering grounds early in the autumn or fall of the year, and immediately turning sheep upon them, has been found uniformly fatal in producing the same disease.—*Vancouver's Survey*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 30, 1828.

OF COMPOSTS OF EARTH, LIME AND DUNG.

Mixing farm yard dung, in a state of fermentation, with earth, in which there is much inert vegetable matter; as the banks of old ditches, or what is collected from the sides of lanes, &c. will bring the inert, dead matter consisting of the roots of decayed grasses, and other plants, into a state of putridity and solubility, and prepare it for nourishing the crops or plants it may be applied to, in the very manner it acts on peat. Dung, however, mixed with earth taken from rich arable fields, which have been long cultivated and manured, can have no effect as manure to other land that the same earth and dung would not produce applied separately; because there is generally no inert matter in this description of earth to be rendered soluble.

Mixing dung, earth, and quick lime together can never be advisable; because quick lime will render some of the most valuable parts of the dung insoluble. It will depend on the nature of soil or earth, whether even quick lime only, should be mixed with it to form compost. If there be much inert vegetable matter in the earth, the quick lime will prepare it for becoming food for the plants it may be applied to; but if rich earth be taken from arable fields, the bottoms of dung-pits, or in fact of any soil full of soluble matter be used, the quick-lime will decompose parts of this soluble matter, combine with other parts, and ren-

der the whole mass less nourishing as manure to plants or crops, than before the quick lime was applied to it. Making compost, then, of rich soil of this description, with dung or lime, mixed or separate, is evidently, to say no more of it, a waste of time and labour. The mixture of earths of this description, with dung, produces no alteration in the component parts of the earth, where there is no inert vegetable substances to be acted on; and the mixture of earth full of soluble matter, with dung and quick lime in a mass together, has the worst effects, the quick lime decomposing and uniting with the soluble matters of the earth, as well as that of the dung; thus rendering both, in every case, less efficient as manures, than if applied separately from the quick lime, and even the quick lime itself inferior as manure for certain soils, than if it had never been mixed with dung and earth at all.

Mixing dung in a state of fermentation with peat, or what in Scotland is called meadow-bank middens, is a successful mode of increasing the quantity of putrescent manure. The peat being dug and partially dried may either be carted into the farm yard, and spread over it, there to remain till the whole is carted out and laid on a dung hill to ferment; or it may be mixed up with the farm yard dung as carted out. If care be taken to watch the fermenting process, as the fire of a clay kiln is watched, a few loads of dung may be made to rot many loads of peat. Adding lime to such composts does not in the least promote fermentation, while it renders the most valuable parts of the moss insoluble. Adding sand, ashes, or earth by tending to consolidate the mass will considerably impede the fermentation.

COMPOST FOR A GARDEN.

Without enumerating the various means that, with careful economy may be used for increasing the stock of garden manure, such as collecting the urine of animals, chamber-lice, soap suds, or mixing fresh soils of opposite qualities, I shall confine myself to a plain statement of a method I have practised for these several years past with much success. Situated the same as many others to whom the produce of the stable-yard is the only allowance of dung that can conveniently be allotted for the garden, which, although every way advantageous for hot beds, and other purposes of forcing, yet to use it as a manure for garden crops, without having its qualities altered by fermentation, or blended with substances of a heavier nature, would in many cases be more injurious than beneficial; I, therefore, during the summer and autumn, have all the offals in the garden, such as weeds, leaves of strawberries, and other vegetables, short grass, peas and asparagus haulm, with the foliage of trees and shrubs, when newly shed, carefully collected into a heap. These are all turned over and mixed during the winter, that they may be sufficiently rotted to mix with the dung against the end of summer. I have also another heap formed with the prunings from goose-berry and currant bushes, fruit-trees, raspberry shoots, clippings of box-edgings, and loppings from shrubs, also the roots of greens and cabbages, which are generally burnt at two different periods in the year, in spring and autumn; but previous to each burning, I endeavor to pare up all the coarse grasses around the garden, with a portion of the soil adhering thereto, and whenever these are sufficiently dried, have them collected

to the heap intended to be burnt. The fire is kindled at a convenient distance from the heaps, and a portion of such as burn most easily is first applied, until the fire hath gained a considerable power. After this the process of burning is continued, by applying lighter and heavier substances alternately, that the one may preserve the action of the fire, and the other prevent it from reducing them too much to ashes. When the whole are thus consumed, a quantity of mould is thrown over the heap to prevent the fire from breaking through; and whenever it can be broke into with safety, it is then mixed up into a dunghill with the rotted vegetables, moss-earth, and stable yard dung, in such proportions as is likely to ensure a moderate fermentation, which is generally completed in three or four weeks; at which time, I think, it is most advantageously applied, in having it carried to the ground, and instantly dug in.—*Memoirs Cald. Hort. Sec. 1* 443

In respect to composts for the amendment of the general soil of the garden, their quality must depend on that of the natural soil: if this be light, loose, or sandy, it may be assisted by the addition of heavy loams, clays, &c. from ponds and ditches, cleanings of sewers &c. On the other hand, heavy, clayey, and all stubborn soils may be assisted by light composts of sandy earth, drift and sea sand, the shovelling of turnpike roads, the cleansing of streets, all kinds of ashes, rotten tanners' bark, rotten wood, and saw dust, and other similar light opening materials that can be most conveniently procured.

The compost ground may be placed in any situation concealed from the general view, but at the same time exposed to the free action of the sun, air, and rain. Its size will depend on that of the garden, and on the sorts of culture for which it is intended. It should generally form a part of the parallelogram inclosure used as hot bed ground, and where there are hot houses, both should be situated as near them as possible.

ON THE CULTIVATION AND USES OF TREES, TIMBER, &c.

[Continued from page 359.]

The most profitable season for felling timber, as regards the age of the tree, is at what may be termed the beginning of manhood. After that time, though the trees may appear sound and healthy, its annual increase is so little, that it would be more profitable to cut it down and replant. The number of years that a tree may stand before it arrives at this period must vary in different soils and situations; but the period may be easily ascertained by the annual shoots—the state of the bark, and by taking the circumference of the trees at the same place for two or three successive seasons, and comparing the difference. In the view of profiting from timber produce, it is of great consequence to cut down plantations at maturity. Many trees will stand half, others a whole century, after they are full grown; appear quite healthy, and at the same time, make little or no increase of timber. But there are particular cases arising from the nature and state of the markets, where it may even be more profitable to cut timber before it is arrived at a full growth.

By experiment of M. Buffon, it was found that trees which are stripped of their bark in May and June, (while standing) and then cut down the next winter, made the most solid, heavy, and strong timber; and the sap-wood in that case, will be

good. Loudon says, "it is the sap, albumum, or white wood which causes timber rapidly to decay. The sap contains saccharine matter, acids, and mucilage, which ferment with heat, and bring on a decomposition of the wood. By the process recommended, the moisture is exhausted without fermentation, and the pores of the albumum contract and harden. The season for cutting the kinds of trees whose barks are not made use of, is winter and early in spring; but the oak, and other trees which are peeled, are left till the middle of April or May. Birch and larch woods will peel nearly a month sooner than oak. If possible, oaks should be barked by the middle of June, as every ton of bark, taken off after the first of July will be deficient two hundred pounds per ton, compared with the same quantity taken off in May or early in June."

Col. Pickering, in an essay on the "Felling of Trees for Timber," (published in the New England Farmer, vol. i. p. 17) says, "in the year 1800, divested of public employment, and about to commence husbandman, I made a visit to the late Joseph Cooper, of New Jersey, one of the most intelligent farmers I ever knew, to converse with him on the subject of his vocation. Among other things he spoke of timber, and stated the following facts: His farm lying on the Delaware river, nearly opposite Philadelphia, was exposed to the ravages of the British army while occupying that city. Pressed for fuel, his fences first fell a prey to their necessities. In the month of May, 1778, they cut down a quantity of his white oak trees; but circumstances requiring their sudden evacuation of the city, his fallen timber was saved. The trees he split into posts and rails to carry on his fencing. It is now, said he, two and twenty years since the fences made of the May felled timber were put up, and they are yet sound; whereas those of trees felled February, were rotten in about twelve years. He then pronounced confidently, that the best time for felling timber trees, for durability, was when their sap was vigorously flowing. He said also, that white oak and hickory trees felled at that season, would not be attacked by the worms, producing what is called 'powder pest.' And added, that hoop-poles of oak and hickory, ought, for this reason, to be cut the same season." The writer then mentions several other instances, and authorities in favor of cutting timber, when durability is the object, at the time when the sap was flowing with the most freedom; and from the instances he has cited, it appears that the only disadvantage attending the practice, is, that the timber thus cut, soon became so dry and hard as to render it difficult to hew it, or make any impression on it with edge tools.

In reference to a memoir of M. Buffon, before adverted to, the British Encyclopedia states, that "by many experiments, particularly described in that essay, it appears that the tree should not be felled till the third year after it has been stripped of its bark; that it then becomes perfectly dry, and the sap (albumum or sap-wood) becomes almost as strong as the rest of the timber—and stronger than the heart of any other oak tree which has not been so stripped; and the whole of the timber stronger, heavier, and harder;—from which he thinks it fair to conclude that it is more durable."

Mr. Plinchas Stevens, of Andover, (Mass.) observes, (see N. E. Farmer, vol. ii. page 370) that, "the arguments adduced in favor of felling timber

in June are not conclusive. From thirty years' personal observation, I find it depends, in a great measure on the quality of the timber. Some young growing timber, will perish sooner than that which is older and more ripe; and secondly upon the use it is put to. We will suppose timber of the same quality wrought into two wagons, one of them, when used is loaded with wet loading the other with dry: it is obvious which will perish first. I trust I shall not be charged with egotism, by those who know me, when I say I have wrought more kinds of timber than most men have, and for more uses than any I know of; and it has been my endeavor to determine what time for felling, and what kind of timber is best for the use desired.— And from the many observations I have made from both, I am satisfied and ready to say without hesitation, that September is the best time; although I believe, that if the bark of timber trees could be taken off in June, without felling the tree, or injury to the wood, and then let it stand till September, the timber would be stronger and more durable. I have seen this done to elm, walnut, and maple. All these are considered of the most perishable kinds that are made use of for timber. All of them proved to be more firm and lasting. I have seen white oak timber felled in Feb. and March, the sap of the wood was perished in September on one side of the logs. I have seen wood cut in May and June, in which more than the sap of the wood was perished in one year. I have seen timber that was cut in September, that the sap was perfectly sound and bright two years afterwards. I have used white maple for hoops to buckets that was cut in September that lasted twenty-one years in constant use, the first ten years for water, the remainder for feeding swine. I have one now that was hooped with maple that was blown down in the September gate 1815, which is perfectly sound. I have one other that I put but one maple hoop on of the same kind, the others were of walnut cut in the winter; the latter I have had to replace three times, once with walnut, once with white ash, and once with red ash. The maple is perfectly sound now. Many reasons may be offered why September is the best time for the felling of timber, but one general reason must suffice for this time.— The timber is more ripe in September than at any other time. I have thought that making these suggestions at this time, might induce some to try the experiment this season of removing the bark from trees designed for timber.

(To be continued.)

RAPE—*Brassica Napa*.

The rape is a biennial plant, a native of Britain, in which country it is cultivated for fattening cattle, as well as in gardens, for culinary purposes.

Culture for small salading. Sow at the same time with cress, mustard, &c. in winter and spring; or at any season when small salading is required. Sow in drills or beds, and follow the culture directed for white mustard.

Field Culture. It may be sown either broadcast or as turnips, in drills—or in beds, and be transplanted, as other varieties of the Brassica or cabbage genus. The usual and most successful mode is to sow from two to three quarts broad-cast, in June or July, when intended for green food; but in August or September, when destined to produce seeds in the next year.

The process for transplanting is too expensive in this country—the necessary hand-hoeing, an

ess the land has been well prepared by previous cleansing crops, would make rape, in the broadcast system, much more troublesome than if cultivated in rows, admitting the introduction of the horse-hoe. In favorable seasons I should not hesitate, where land is cheap and labor is dear, to allow it, when intended for green food, to take its chance, without the aid of either hand or horse-hoeing.

Produce and Gathering. It produces in ordinary seasons on rich alluvial, or other deep friable soils, from forty to seventy bushels of seeds, determined in quantity, very much, by the accuracy of tillage and the condition and nature of the land. Great care and precision are necessary in harvesting the seeds in June or July, of the year succeeding that in which they are sown. When the pods assume a brownish cast, and some of the seeds become black, the crop is reaped with sickles—laid regularly in handfuls or grips in rows, where it continues until the straw becomes somewhat white—the seeds of the color of which we find them in the shops. If they be allowed to become too dry, they fall out on the slightest motion—when carried too green, they are liable to be heated. At the proper time they must be threshed in the field upon old snails or cloths, to which the crop should be carried on sledges, prepared with cloths, or by similar means. The seeds must be carefully spread in small quantities in granaries or on barn floors, and be occasionally moved.

Use. Sheep and neat cattle are extravagantly fond of it—but of all plants, perhaps it is the most likely to cause them to be blown.

There is much difference of opinion as to its nutritive properties in the green state. I believe that it quite equals the common cabbage, and very far exceeds turnips of all kinds in the quantity of nutrition it contains—in the value of the oil for various manufacturing purposes, and the excellence of the cake after it has been expressed, for cattle food and the manure of drill crops, no question can be entertained.

It is not a certain crop—as it is exposed to all the enemies which attack turnips and cabbages—and is liable to be injured at the season of blossoming by mildew, and sometimes by frosts.

INSECTS.

It is now time to be on the alert to guard your garden vegetables against bugs, flies and other insects without name or number. There have been recipes for the purpose published in this, and other agricultural works, such as decoction of elder, of aloes, of tobacco, snuff, quick lime, lime water, blimstone, unleached ashes, tar water, water impregnated with turpentine, plaster of Paris finely pulverized, decoctions of walnut leaves, and other bitter or acrid substances. No doubt all these matters are useful, and may answer the purpose if applied often enough. But they are liable to be washed by every shower, and the insects, always on the alert, will be sure to take the advantage of every circumstance of that kind, and will now and then take a little physic rather than suffer for lack of food. Besides some of them "enounce themselves," as Shakespeare has it, under the leaves, where you cannot attack them with any success. We, therefore, are inclined to think that the best, if not the only safe guard which can be relied on, in order to secure water melons, cucumbers, squashes &c. against bugs, flies or any insect, which assails them above ground is some

sort of fence which will exclude the insects, but admit sun, air and moisture. Perhaps nothing of the kind will be found more cheap and convenient than a thing of the form and mode of structure which follows:

"Take a strip of pine board (about three fourths of an inch in thickness is most suitable) eight or ten feet in length, and four or five inches in width, plough one edge of it with a carpenter's plough or match plain—then mark off an equal number of side and end pieces; before sawing the side pieces, run a Brad awl through where you want to drive your nails, as it is not so likely to split, as after it is sawed. The side pieces eleven inches long—ends eight inches long. They must be of this particular size, because one yard of millinet will just cover nine boxes; or a third of a yard will make three covers. After having nailed your boxes and divided your millinet, have some thin strips or tongues, as the carpenter call them.—Press these with the edges of the covers into the groove—which fastens them much cheaper and more expeditiously, than small nails."

The last number of the Edinburgh Review contains articles on the following subjects:—Character of Dryden as a writer—Dietetics—Progress of the National Debt—Best Method of Funding—New South Wales—Wakefield's Case; Scottish Marriages of English Parties—Pestalozzi; Diffusion of Knowledge—Indian Taxation of Englishmen—Poetry; Cunningham's Songs—Emigration—Sir Harry Moncrieff—State of Parties.

The last Quarterly Review contains the following articles: On Ornamental Plantations and Landscape Gardening—Salmon Fisheries—Memoir and Correspondence of Lord Collingwood—Lord Byron and some of his Contemporaries.—The Corn Laws—A Pilgrimage in Europe and America—Maynooth—Markland's Proposal for a Museum of National Antiquities—Police—Campaigns of the British Army at Washington and New Orleans—Attempt to reach the North Pole—Emigration Reports.—Published quarterly by Wells & Lilly, Boston, at \$5 per annum.

Bull Bolivar.

The high bred imported Improved Short-horned Bull Bolivar, will stand at the undersher's stable in Charlestown, Mass. Price \$5 for each cow for the season. This bull was selected by Mr. Coates, the keeper of the Herd Book, without limitation of cost, for the use of the Pownall stock, and is so highly valued by Col. Powell, that he has always refused to sell him, and has consented to part from him but for a season, considering him in form, points, and pedigree, equal to any animal to be had in Great Britain.

Bolivar is red and white, is not three years old, and has never been forced; yet he gets immediately behind his fore legs 7 feet 8 inches. The singular neatness of his shoulder, the straightness of his back, the width of his loin, the smallness of his head, neck, and loins, the quickness of his gait, together with his fine, close, short and fine family as dairy stock, render him one of the most desirable males, or improving our neat cattle, that can in any country be found.

SAMUEL JACQUES, Jr.

Valuable Stock.

For sale, 7 Heifers, 2 and 3 years old, raised from some of the best cows in this State, by Denton. Five of them have brought over this spring, and had far to make excellent milkers. They were selected by the present owner from the best of his stock, to be kept on his own farm and are offered for sale in consequence of his having disposed of his farm. They are worthy the attention of any farmer who wishes to obtain good stock.

Also, 2 Horse Cobs, 1 and 2 years old, by the imported horse Roma, from excellent males, well known in this city. Apply to the publisher of the N. E. Farmer. June 6.

Field Seeds.

For sale at the New England Farmer Seed Store two barrels of small white prolific Field Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and are all of the growth of 1827.

This day Published,
And for sale by S. G. Goodrich, No. 114, Washington-street,
THE LEGENDARY—Vol. I.
Consisting of Original pieces in prose and verse, principally illustrative of American history, scenery, and manners. Edited by N. P. Willis.

It is proposed to continue this work, and to publish a volume once in 3 or 4 months, at the expense of the publisher. The volumes will be sold separately—price \$1.25 per vol. j. 6.

MILLENET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of superior quality, gentlemen in want of this article are requested to call on the undersher.
Also, a further supply of Orchard Grass, Leicester, Pook Meadow, Mangel Wurtzel, Sugar Beet, Ruta Baga, Russian Flax, Lima Beans, &c. with several new varieties of Turnip Seed from Europe, including the Yellow Main, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh Water Mustard Seed—Also, Green Citron, Pine Apples, and Pomegranate Musk Melons; Carolina and Long Island Water Melons.—A further supply of Double Almond Dahlias, 100 Single Dahlias, at the low price of 25 cts. each root.

New Variety of Radish.

For sale at the New England Farmer Seed Store, a few pounds of Long White Stammer Naples Radish, a variety highly esteemed in the Southern States.

Bull Young Cow.

This noble animal, (of the new improved Durham short horned stock) is from *Admiral* and *Annabell*, presented to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Coffin, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in his native State. He will remain at the farm of E. H. Dobby, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be used at \$3 for each cow, payable in advance. The whole proceeds from this animal, (the present season) will be for the benefit of the Society. Cows sent from a distance will be taken care of, if desired, at a reasonable charge.

MISCELLANIES.

THE COTTER'S HOME.

Who hath his home in a rural glade,
And his evening seat in a sweet-brier shade:
With verdant fields and blooming flowers,
For his morning walk and evening hours.
And with all these, a cherub son,
And a much-loved, smiling, devoted one;
At another hand, with him to rove,
Thro' the fields, the garden, and the grove;—
Whate'er his humble fortune be,
Enjoys earth's purest felicity.

Oh! who that hath tasted this, would not
Exchange for the cotter's humble lot,
Those air, noblings, which engage
A cot, and form his equipage?
Who would not exchange the baubles bright,
That cobble glitter in a city's night,
For those bright stars that deck the dome,
And twinkle in joy o'er the cotter's home?
Peace and contentment thence alone,
And tranquility, sit on their triple throne.

See how the birds fit round and round,
Exchange for the cotter's humble lot;
List to the mock-bird's lay of love,
And to the sorrow's chirp in the lithe grove;
How sweetly, with their humble lay,
The cotter's care those birds repay.—
For an archer's arrow have they to fear,
Nor missiles of cruel archers, here—
As they perch at will on the althea spray,
And sing the evening hour away.

His native hath, in her wide domain,
One favorite spot where she loves to reign,
'Tis the cotter's bower, with its fields and groves,
And fragrant flowers, and Sylvan loves.
Where she sits and tunes her evening lyre,
As tranquility and peace inspire;
'Tis the rural glade, with its wood-note wild,
Where dwells her favorite happy child;
Where stands the lowly, humble dome,—
The cotter's and contentment's home.

Board of Health.—A countryman, upon visiting New-York during the yellow fever, asked why a board fence was placed across the street and upon being informed it was erected to separate the infected part of the city, observed that "he had often heard of the *Board of Health*, but had never seen it before."

How to tell a bad husband.—A few days since a man was engaged in loading his cart with boards which had recently been drawn from a raft, and had placed his horse in a position which rendered it difficult to pass; two girls, one of them a smiling little gipsy, not liking the obstruction, turned the horse out of the way. The man, who at that moment was tottering under the weight of a heavy plank, burst forth with a volley of abusive language; when this smiling fair stretched forth her finger and exclaimed, "I'll bet a dollar you whip your wife."

Dancing.—"I am an old fellow," says Cowper, in one of his letters to Hardis, but I had once my dancing days as you have now, yet I could never find that I could learn half so much of a woman's real character by dancing with her, as conversing with her at home, when I could observe her behaviour at the table, at the fire side, and in all the trying scenes of domestic life. We are all good when we are pleasant, but she is good who wants not the fiddle to sweeten her."

Natural Barometers.—The following are a few of those plants which indicate changes in the weather: Chick-weed is an excellent barometer. When the flower expands fully, we are not to expect rain for several hours; should it continue in that state, no rain will disturb the summer's day. When it half conceals its miniature flower, the day is generally showery; but, if it entirely shuts up, or veils the white flower with its green mantle, let the traveller put on his great coat. The different species of trefoil always contract their leaves at the approach of a storm; so certainly does this take place, that these plants have acquired the name of the husbandman's barometer. The tulip and several of the compound yellow flowers also close before rain. There is, besides, a species of wood-sorrel, which doubles its leaves before storms and tempests. The hahunia or mountain ebony, cassia, and sensitive plants, observe the same habit.—*Philosophy in Sport.*

INTOXICATION.

The laws against intoxication are enforced with rigour in Sweden.—Whoever is seen drunk is fined, for the first offence three dollars; for the second six; for the third and fourth, a still larger sum; and is also deprived of the right of voting at elections, and of being appointed a representative. He is, besides, publicly exposed in the parish church on the following Sunday. If the same individual is found committing the same offence a fifth time, he is shut up in a house of correction, and condemned to six months' hard labor; and if he is again guilty, to twelve months' punishment of a similar description. If the offence has been committed in public, such as at a fair, at an auction, &c. the fine is doubled; and if the offender has made his appearance in the church, the punishment is still more severe.—Whoever is convicted of having induced another to intoxicate himself, is fined three dollars, which sum is doubled if the drunken person is a minor. An ecclesiastic, if he should fall into this offence, loses his benefice; if it is a layman who occupies any considerable post, his functions are suspended and perhaps he is dismissed. Drunkenness is never admitted as an excuse for any crime; and whoever dies while drunk, is buried ignominiously, and deprived of the prayers of the church. It is forbidden to give, and more explicitly to sell, any spirituous liquors to students, workmen, servants, apprentices, and private soldiers; whoever is observed drunk in the streets, or making a noise in a tavern, is sure to be taken to prison, and detained until sober, without however, being on that account exempted from the fines. Half these fines go to the informers (who are generally police officers) the other half to the poor. If the delinquent has no money, he is kept in prison until he has worked out his enlargement. Twice a year these ordinances are read aloud from the pulpit by the clergy; and every tavern keeper is bound under the penalty of a heavy law fine, to have a copy of them hung up in the principal rooms of his house.

Cure for the Scratches in Horses.—An ointment of itch weed or poke-root is said to be a certain cure for the troublesome disease called scratches in horses. By making a strong decoction of this root, and adding an equal quantity of melted lard, a few applications to the fetlocks of the horse, it is said, will effect a cure.—*Belvedere Apollo.*

ESTABLISHMENT FOR SEEDS.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England—of the crops of 1877. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. The following comprises some of our most prominent sorts.

<i>Artichoke</i> , Green Globe	<i>Lettuce</i> , Early Curled Silesio
<i>Asparagus</i> , Devonshire	Large Green head
Gravesend	Royal Cape
Batavia	Imperial
Large white Reading	Early Green
<i>Beans</i> , Early Yellow Cranberry	Brown Dutch
Early Molawk	Grand Admiral
Early Yellow six Weeks	Tombshell, or Rose
Early Canadian Dwarf	Drumhead
Early China Dwarf	Magnon Bonum Cross
Dwarf Huster	Black Cross
White Kidney Dwarf	White Cross, or Leaf,
White Cranberry Dwarf	Green Cross
Red Cranberry Dwarf	Pure Apple
Warrington or Marrow	Green Curra
Thousand to One	Persian
Large White Lima	Nottingham
Saba, or Carolina	Large Canteleupe
Red Cranberry string	Pomegranate, or Musk,
White Cranberry string	Carolina Water
Broad Windsor	Long Island Water
Field	Apple seeded, Water
<i>Beets</i> , true Long Blood	<i>Mezquon</i>
Early blood Turnip	Mustard, White and Brown
Early White Swartz	Nasturtium
French Sugar, or Amber	Muced Wurtzel,
Green, (for soups, &c.)	Oxla
<i>Beetroot</i>	Onion, Potatoe
Early White	Tree
Early Purple	White Portugal
Large Cape	Yellow
<i>Bennet's Spouts</i>	Madeira
<i>Cabbage</i> , Early Salisbury dwarf	Strasbourg
Early York	Large Red
Early Dutch	<i>Parsley</i> , Siberian
Early Sugarloaf	Dwarf Curled
Early Lion, Battersea	Curled, or Double
Early Favourite	<i>Parsnip</i> , Large Dutch swelling
Early Wellington	Silver Skinned
Large Bergen, &c.	<i>Peas</i> , (14 varieties.)
Large Cape Savoy	<i>Poppers</i> , Long, or Cayenne
Large Scotch	Tomato, or Squash
Large Green glazed	Tree
Large late Drumhead	<i>Cherry</i>
Tree, or 1000 headed	<i>Pumpkins</i> , Finest Family
Green Globe Savoy	Connecticut Field
Red Dutch	Mammoth
Yellow Savoy	<i>Radish</i> , Early Frame
Turnip rooted, &c.	Short top Scarlet
Russian	Long Salmon
Late Imperial	Purple Short Top
Late Sugarloaf	Long white, or Naples
<i>Caradon</i>	Cherry
<i>Carrots</i> , Early Horn	Violet colored
Albino	White Turnip Rooted
Blood Red (for West India market)	Black Fall, or Spanish
Lemon	<i>Rhubarb</i> , for tarts, &c.
Long Orange	<i>Ruta Baga</i> ,
Cremer	<i>Salsify</i> , or vegetable oyster
<i>Cauliflower</i> , Early and Late	Sea Kale,
<i>Celery</i> , White solid	<i>Scirpus</i>
Rose coloured solid	<i>Scoroneria</i>
Italian	<i>Spinach</i> , New Zealand
Celeric, or turnip rooted	Prickly, or Fall
<i>Cherrie</i>	Round leaved summer
<i>Chives</i>	Eng. Patience Duke
<i>Corn Salad</i> , or Vetch-kast	<i>Sage</i>
Curled, or Peppercress	<i>Squash</i> , Early bush Summer
Cross, broad leaved or Garden	Long Crook Neck
Water	Vegetable Marrow
Long Orange	Porter's Valparaiso
<i>Cucumber</i> , Early Frame	Acorn
Green Cluster	<i>Tomato</i>
Short Prickly	Early White Dutch
Long Prickly	Early Garden Stone
Long green Turkey	White Flat, or Globe
Long white Turkey	Green Round
White Spined	Red Round
Small Girkin, &c.	Swan's Egg
<i>Egg Plant</i> , Purple	Large Egg, Norfolk
White	Long Tan kard
<i>Endive</i> , Green	Long Yellow French
White Curled	Yellow Dutch
broad leaved Patavian	Yellow Maltese
<i>Garden Burnet</i>	Yellow Aberdeen
<i>Garlic</i> , Irish	Yellow Stone
<i>Indian Corn</i> , (several varieties)	Yellow Swedish
Kale, Sea	<i>Thyme</i> —Sweet Basil—Boneset,
Purple curled	Lavender—Rosemary—Hyssop,
Green early Scotch	Wormwood—Sominer Savory,
<i>Leek</i> , London	Young root—Spinnard—Dill,
—true Scotch	<i>Zula</i> —Tansy—Bore, &c.

AGRICULTURE.

Abstracted by the N. E. Farmer.

SALT WATER FISH IN FRESH WATER.

The London Quarterly Journal of Science for January 1828, contains a long article on the naturalization of fish, by J. McCulloch, M.D. F.R.S. &c. In this the writer, in allusion to former remarks on this subject, says, "since the communications I formerly made, the *pike* had been introduced, [into a sheet of fresh water.] It swam away briskly, therefore it could not die of the fresh water; but it has not been retaken. The *brille* has also been introduced since my former list. It has been retaken; and, within one year, had grown to double the original size.

"The *turbot*, fifty or sixty were introduced, averaging about eight inches in length. Some were retaken in a year for the purposes of examination merely, like the former and most others; they also had grown to double the size. The *wasse* has been retaken after a considerable period. The *basse* has propagated; and so has the *brille*. The *red mullet* has been introduced and is living. The *whiting* was introduced, and taken in good health many weeks after, but not since. The *grey loach* is thought to have bred considerably. The *athetine* continues to breed.

"I formerly mentioned that the flavor of the several fishes was improved; this is now more positively asserted, in addition of the *basse*, the *plaine* and the *red loach*. Others were mentioned in former communications.

"General experience has shown that in all fishes, as far as known, the access to fresh water, or fresh water food, improved the flavor;—in many, in oysters, muscles, cockles, shrimps, it is vulgarly notorious; as in mere sea water they are worthless."

The writer thinks it "an essential point to discover what kind of fishes would so live together, that all species might find food; might breed each to its useful limits, so as to be serviceable to ourselves, the keepers of the flocks, and without hazard of the extermination of any kind." For instance, "*pike* and *perch* can live together, because the natural defence of the *perch* prevents the *pike* from exterminating the race, voracious as the enemy is. If *trout* and *pike* were confined to narrow water, the *trout* would be destroyed." He observes that "the *basse* appears to have been the great enemy—to have eaten up the greater number of many species, and to have given no return. It has proved the *pike* of this pond. This could not have been foreseen; it is a caution to speculators. Others will he discovered in the course of trial. It appears, also, that the common *crab* has proved destructive, probably by eating the spawn of larger fishes. From some enemy or other, the *eels*, which at first abounded in a most incredible degree, have most materially diminished, and so have the *shrimps*. The latter at least appear to have been destroyed by the *basse*. Time and trial will teach us what to do in this case; in the infancy of ignorance, man might have supposed that he could keep wolves and sheep in one field, and have constructed a pen for foxes and fowls, rab-

bits and weasels. We must not accuse nature of her own ignorance."

"The writer is of opinion, that the difficulty in the transportation of fishes, is not so great as has been imagined. "Let them be treated with gentleness when taken, as if they could feel; and they will not die in being removed into a cask of water." He advises to adopt the Chinese method of transporting the spawn of fishes as affording the greatest facility to their propagation. He states that in China, the spawn of fishes is a common article of sale in the markets. "There also the cultivation of fish for sale, their transportation to market, and their replacement in the ponds if unsold, is as much matter of ordinary farming, as the management of a poultry yard; while the pond is often the most profitable part of the farm. This species of poultry yard, or fish pond, is as easily and regularly stocked in this manner, and managed, as any other portion of the farm; since it is even destroyed, or suffered to become dry occasionally, and again renewed in the wet season by purchased spawn or stock; just as a sheep farmer buys lambs to stock his mountains."

Extracts from Knight's Treatise on the Culture of the Apple and Pear, for the New England Farmer.

The effects of cultivation on the animal and vegetable systems are extremely similar. A change in form, in color, and in size or stature takes place in each; and in each those changes appear to arise from similar causes—from a more abundant and regular supply of nourishment than is afforded in a state of nature, with a favorable climate, or protection from the bad effects of an unfavorable one.

From the open structure of the blossoms of vegetables, and from the numerous tribes of insects, which feed on their honey, or farina, a sexual intercourse must of necessity take place between neighboring plants of the same species; and I am much more disposed to attribute this intercourse to the intention than to the negligence of nature.

My wishes were of course, to correct the defects, and to combine the different excellence of the best fruits; and I was not without hopes that the offspring would possess a greater degree of strength and vigor, as it is known to do in cultivated animals. A few days, therefore, before the blossoms expanded of the kinds from which I wished to propagate, I opened the petals and destroyed the males in all the blossoms which I suffered to remain of one kind, taking great care to leave the females uninjured; and when these blossoms were fully expanded, I impregnated half of them with farina taken from another kind of fruit, leaving the other half to the care of the bees; which were collected in great numbers, (owing to the scarcity of flowers at that season) and passed busily from one blossom to another. I had soon the satisfaction to observe that every fruit, which I had impregnated, grew rapidly, whilst half of those on the other tree, which remained in their natural state, failed; with every one of those left to the care of the bees. Whence I was disposed to conclude that these insects were not so good carriers of the farina of plants as I believe, generally supposed by naturalists: but in

subsequent experiments, where the blossoms on the neighboring trees have been more numerous, I have had reason to draw a different conclusion.

The plants I have obtained from the fruits on which this experiment has been made are certainly much the most promising I have yet seen.—Some of these possess the character of the male parent, others that of the female; in some that of both appears blended, and in others I do not distinguish that of either. Many of them appear to be perfectly free from hereditary disease and debility, and the fruit of some of them is not in any degree inferior in those from which I derived its existence. Every seed, though several were taken from the same apple, has afforded a new and distinct variety; and some of these grow with more luxuriance than others and the fruits produced by the different plants possess very different degrees of merit. An estimate may in some measure, be made of their good and bad qualities at the conclusion of the first summer, by the resemblance the leaves bear to the highly cultivated, or wild kinds; as has been remarked by the writers, on this subject, of the 17th century.

The leaf and general habit of a seedling plant, will, however, by no means convey any correct idea of the merits of the future fruit. Where these have the character of high cultivation, the qualities of the fruit will be far removed from those of the native species; but the apple may be insipid or highly flavored green or deeply colored, and of course well or ill calculated to answer the purposes of the planter. An early blossom in the spring, and a ready change of color in the autumnal leaf, would naturally be supposed to indicate a fruit of early maturity; but I have never been able to discover any criterion of this kind, on which the smallest dependence can be placed.—The leaves of some varieties will become yellow and fall off, leaving the fruit green and immature; and the leaves in other kinds will retain their verdure long after the fruit has perished.

The plants where buds in the annual wood are full and prominent, are usually more productive than those whose buds are small and shrunk in the bark, but their future produce will depend much on the power the blossoms possess of bearing the cold, and this power varies in the different varieties, and can only be known from experience. Those which produce their leaves and blossoms rather early in the spring are generally preferred, for though they are more exposed to injury from frost, they less frequently suffer from the attacks of insects, the more common cause of failure.

The disposition to vegetate early or late, in the spring, is like almost every other quality of the apple tree, transferred in different degrees to its offspring; and the planter must therefore seek those qualities in the parent tree, which he wishes to find in the future seedling plants. The most effective method I have been able to discover of obtaining such fruits, as vegetate very early in the spring, has been by introducing the farina of the Siberian crab into the blossom of a rich and early apple, and by transferring in the same manner the farina of the apple, to the blossom of the Siberian crab. The leaf and habit of many of the

plants, that I have thus obtained, possess much of the character of the apple, whilst they vegetate as the crab of Siberia, and possess at least an equal power of bearing cold; and I possess two plants of this family, which are quite as hardy as the most austere crab of our woods, and are, I think, capable of affording cider of a much greater merit than any which has yet existed.—These plants appear also to have inherited the powers of the Siberian crab tree in bearing an annual succession of crops, during many years without being exhausted or weakened.

The Siberian crab, which has been introduced into the gardens of this country affords a somewhat remarkable instance of the power, which plants possess, of adapting their habits to the climate in which accident or the industry of man has placed them. In the climate of Siberia, the change of seasons is extremely rapid, and summer almost instantly succeeds the solution of its snows. From the habits the crab has there acquired, its seeds are very apt to mistake the termination of a frost in the end of Jan. for the commencement of spring, and to expose themselves to almost certain destruction, by vegetating at that season. For this reason, they should always be planted in pots or boxes of mould ready to be removed into a place of shelter. The seeds of the English crab, which differs from the Siberian only in having adapted its habits to a different climate, trust themselves with more apparent caution to the changes of our unsteady seasons, and do not vegetate till the spring is a good deal more advanced. The crab of Siberia, also accustomed to the short, but warm summers of that country, advances rapidly to maturity; whilst the long, though cool and shadowy summers of England, appear to have taught our native crab that there is no occasion for so much expedition. The offspring of each would probably retain their acquired habits during several generations, into whatever climate they might be introduced.

MAKING BUTTER.

MR. FESSENDEN.—In Number 45 of the present vol. of your paper, J. D. Boring states that many of his neighbors cannot get butter from their cream after churning a whole day. In my boyhood I have had to churn a whole day and half a night, and not get butter. Since I have had a dairy it has sometimes happened so, but for years past, we have no more difficulty in getting butter in winter than in summer. The reason of butter not coming, is cold—and in that case it will be come frothy, and when so, if it ever makes butter it will not be of a good quality. My wife's method is, to set the vessels in which the cream is collected, near the fire a while before it is put into the churn, and frequently stir it a little, and turn the vessels that it may be warmed equally, till it is as warm as cream in the summer, as near as she can judge—and before putting it into the churn, that is scalded with sealding water. When the churning commences, it is done moderately, and if there is any frothy appearance, then warm water is put in the churn put near the fire, and occasionally turned till the temperature is altered, and the churning is finished, which is generally in a short time. If a dash churn is used, set it into a tub of hot water, and frequently move the dash a little, to mix the warm and cold cream till it is of a suitable warmth which an observing person will soon determine by practice.

FOR THE NEW ENGLAND FARMER.

PRESERVATION OF POTATOS.

At this time of the year, potatoes put out shoots freely and if they are picked off, they will require to have the same operation repeated in seven or eight days after, if the weather be warm.

To prevent this, take your shovel, and shovel the potatoes out of the bin in the cellar on to the floor, and leave them there for a week. Then shovel them back again, to be about a week longer, when the same process may be repeated.—Continue these operations till the season is over. If the sprouts are broken off, according to the usual practice, the potatoes immediately send forth fresh shoots, which exhausts the nutriment, and destroys the value of the root.

AN IRISHMAN.

FOR THE NEW ENGLAND FARMER.

MAKING BUTTER.

MR. FESSENDEN.—I have observed several suggestions in your paper on the subject of making butter—and an inquiry in your paper of the 30th ult. for the mode of fetching butter quick. I am a lover of good butter, and have paid some attention to the subject, and if my ideas can be of use to your subscribers, they are at your service: And, first, the cows should be in good condition, and well kept and regularly salted at least once a week. They should then be regularly milked, and milked quite clean at every mess. The strippings being the richest part of the milk. There should then be a strict attention to neatness and regularity in every subsequent part of the process. The milk should be set in a room which can be constantly ventilated with pure air. A want of attention to this last particular, is the great defect in the construction and attention to our dairies and milk-rooms. The cream should be regularly gathered from the milk without being suffered to stand upon it.

It does not in my opinion improve the butter to have the milk sour before the cream is gathered; but at this season of the year, it can hardly be prevented. It should, however, never be suffered to stand until the milk curdles. When the cream is gathered, it should be set in an open vessel, where the air can have free access to its surface; and during the time that the cream is gathering for a churning of butter, it should have a stick or spoon kept in the vessel, where the cream is—by which the cream should be stirred at least a half a dozen times a day, enough to mix it up well and bring a new portion of it to the air—and it should stand before the window of the milk room, or in some other, the most airy position afforded by the room. When you have gathered a mess, for this season of the year, fill your churn over night with cold water, and empty it in the morning. Put in your cream and churn it with a regular, steady, and not too rapid motion. It will generally come, in from ten to twenty minutes—and when fetched it needs no coloring matter.

I know that women say flies will get in the cream if left uncovered—let them get in, and pick them out, rather than cover up the vessel containing the cream.⁸⁵

The windows to milk rooms in many houses, are not sufficiently large, with from four to eight

⁸⁵ Perhaps a covering of millinet, gauze, or other light and porous substance, or a lid prepared with small holes, might admit air and exclude flies.—EDITOR

small panes of glass. This affords too stimed a portion of air. If your glass is small, you want a twenty-four lighted window at least to the milk room with blinds to exclude the sun. If two such windows, so situated as to afford a draught of air the better. But stint your milk room of air, and keep the cream pot covered tight, to exclude the flies, and your butter will be white and bitter, besides being a long while coming.

A LOVER OF GOOD BUTTER.

FRUIT TREES.

MR. FESSENDEN.—I believe it is admitted by most horticulturists that when they have a northern aspect or exposition, they are more productive and regular in their bearing, than in any other, particularly an exposition to the sun. With respect to the cause or causes of this difference, it appears, they are not so well agreed, some attribute it to the circumstance of their putting forth their flowers later in the season, thereby escaping the frosts; and others to a supposed influence of the wind in preventing frosts from lighting on trees in that exposure. But it requires but little observation to discover, that they light on fruit trees and other plants, as well in a northern exposition as in a southern: they rarely, however, prove destructive in that situation; whereas, they rarely prove innocuous in this.

The plant, like the animal, when it has been exposed to a low temperature, becomes highly sensible to the impressions of heat: and with great deference to the opinions of others, I conceive it is not so much the frost alone, that is so noxious to vegetable life, as it is the abrupt transition from cold to heat—the exposure of tender plants and flowers of fruit trees, chilled with frost, to the unmitigated heat of the sun as soon as it rises above the horizon; for if the morning, immediately succeeding a frost, be cold, or the sun obscured by clouds, or fog, the injurious influence of the sun is counteracted or excluded; the change of temperature is rendered less abrupt, and it has been remarked that tender plants and the flowers of fruit trees sustain no harm. These means of preservation against the ill effects of frosts are embraced in a northern exposure, a situation closed against the morning sun, and open to the admission of the chill air or winds of the north, as the northern declivity of a hill or mountain—a situation bounded near on the south by a wood, and clear and open on the north and west. The north side of an orchard—and indeed the north side of a tree.

A few days since, I heard two gentlemen, advanced in age, and of extensive observation, speaking upon this subject; one of whom observed that he had an orchard, that bore generally very well on the north side, but was frequently unproductive on the south, and that he had noticed the same with respect to many other orchards; and the other spoke of an apple tree in his garden, that, for many years had borne on the north side, and not on the south.

From many years' observation, I am induced to believe that frosts are less destructive in new countries than in old improved ones; and if the real fact be according to this impression, I should not hesitate to ascribe it to the comparative chilliness of the morning in a new country, from a but-

mid atmosphere, generated by extensive forests and an undrained soil. T. W.

Bristol, R. I. June 11, 1828.

INDIGENOUS PRODUCTIONS.

The treasures of our country, vegetable and mineral, are but half discovered, or but half applied to their proper uses. Among the vegetable productions of our country, either little known, or whose uses are but little understood, we may mention a few on account of their curiosity, as much as for their utility, which we find mentioned in the Western Review,—a work, whose lively descriptions of the West and its peculiarities, we advert to with pleasure.

The Wild Rice of the Northern Lakes, whose very existence is not known, except to the savages, the Canadians, and the *Coueurs du bois*, who traverse these regions, is, however, next to maize, the most prolific, perhaps, of the *ceræalia*. It is found in the greatest abundance on the marshy margins of the lakes, and in the plashy swamps on the upper courses of the Mississippi, where it covers a vast extent of country. It is there that the Canadian hunters and traders find their annual supplies of grain, and that the millions of migrating water-fowls fatten, before they take the autumnal migration to the south. It very accurately resembles the Cane-Grass of the swamps, and Savannas on the Gulf of Mexico. It springs from all depths of water, from seven feet to one, where the bottom is soft and muddy, and rises from five to eight feet above water. At the time of gathering it, canoes are rowed about it, a blanket is spread on the canoes, and the grain is beaten down into the blankets. It grows in perfection as far south as Natchitoches, south of 32 deg.; and might possibly be cultivated in many of the drowned lands, or ponds and marshes of the Atlantic country.—Well prepared, it is as white as common Rice; and puddings made of it, taste like those of Sago.

The *Cane*, which every one has seen in the shape of angling rods, grows on the lower courses of the Mississippi, Arkansas, Red River and their waters, and rises in height from fifteen to thirty feet;—the leaves abundant, and of a beautiful green; and it grows so thick, that the stalks seem contiguous—while above, there is an imperious roof of verdure. The smallest sparrow could hardly fly in these cane brakes; and a man could not make a progress of three miles a day. The burning of a cane-brake, when cut down and dried, is a singular spectacle enough. The rapid flame, with the myriads of detonations from the rarified air in the hollow compartments of the cane, nearly as loud as the report of a musket, give the idea of an army in the fury and flame of battle. At the end of five years it produces an abundant crop of farinaceous seeds, of the taste of wheat and used like it, for bread, by the Indians and first settlers. No spot affords so rich and perennial a range for cattle, as the cane-brake. The butter from it is of the finest quality and flavor. The stem rises six feet before it loses its succulence and tenderness; and no vegetable or grass affords so rich and abundant a fodder, of so rapid a growth. It might, says the writer, be worth the experiment of sowing it annually, in regions where it will not survive the winter.

He mentions other plants which we cannot now notice; particularly, the *Dogwood*, for its restorative powers in cases of ague, which are unknown to our administrators of simples;—the *China Tree*, for

its narcotic properties, and whose bark is a powerful vermifuge,—no contemptible property, in a country as rank of animal as vegetable life;—the *Pineapp* pulp, is an odd mixture, of the taste of eggs, cream, sugar and spice, and is, indeed, a sort of natural custard;—the *Laurel Almond*, whose delicious flowers might be used to essences, surpassing those of the East;—and the small, deep blue *Persimmon*, which when ripened by the frost, is sweeter than the fig, and is almost a pulp of concrete sugar. It is, says the writer, when thoroughly ripe, a pleasanter fruit than dates; and had we to obtain it from beyond seas, the kinds would be discriminated, and the best of them cultivated.—*Baltimore American*.

THAMES WATER.

He who imputed the superiority of London porter to the excellence of the Thames water, may probably find a reason for his faith, in the following statement, recently submitted to parliament, while the motion of Mr Hobhouse, respecting the supply of water in the metropolis, was under discussion.—*Salon Observer*.

“Between Chelsea and the river Lea, no less than one hundred and thirty-nine common sewers empty into the Thames. To these, says one of the Journals, “are to be added a vast number of soap works, glass houses, drug mills, white lead, and turpentine manufactories, besides other buildings, too numerous and too minute to be detailed. This mass of impurity, kept in one continual motion by the tides and navigation, after having been properly agitated and fermented, is sucked up by our friend the Dolphin,* who forthwith relieves his stomach, by depositing whatever he cannot swallow, in our pipes and cisterns, for the purpose of making soup, or tea, or coffee, or boiling our meat and vegetables.

“A Mr. Wright, who has investigated the subject, affirms, that in August last, a shoal of fish were actually poisoned, by coming into the water discharging from one of the sewers.”

* The engine by which the water is raised.

SMALL FARMS.

It is not the abundance of land, but the thorough and skillful cultivation of it, that fills the barn with hay, the cribs with corn, and the mansion house with plenty. For one to crave a larger farm than he can cultivate to profit, is therefore an expensive folly; for whatever a neglected field is worth, the interest of the capital, together with yearly taxes, will at length eat the field up.—*Con. Courant*.

Bed bugs.—Of the various receipts for the extirpation and prevention of these vermin, the following have been found by experience, the most effectual: Take of the highest rectified spirit of wine, half a pint; newly distilled oil, or spirit of turpentine, half a pint; mix them together, and crumble into an ounce of camphor, which will dissolve in a few minutes; shake the whole well together, and with a piece of sponge, or brush dipped into it, anoint the bed, or furniture, in which those vermin harbor and breed; and it will infallibly kill and destroy both them and their nits. Should any bugs appear after once using it, the application must be repeated, and at the same time some of the mixture poured into the joints and holes of the bedstead and head-board. Beds that have much woodwork, require to be first tacked down, before they can be thoroughly cleared

of this vermin; but others may be perfectly cleared without that trouble.

It is advisable to perform this work in the daytime, lest the spirit contained in the mixture take fire from the candle, and occasion serious damage. Or, dissolve one hundred grains of corrosive sublimate in a pint of brandy, or whiskey; use it with the feather of a quill.—*Domes. Encyc.*

External impressions on children.—All violent impressions on the senses and the bodies of children, ought to be carefully avoided. It is injurious to toss them about with rapidity in the arms. Loud crying, or shouting in their ears, discharging fire arms, presenting glittering objects to their view, as well as sudden and too great a degree of light, are equally injurious. Thus infants are frequently stupefied and frightened—the brain is shaken in the most detrimental manner, and hence arise the most distressing consequences. On such occasions, we cannot bestow too much attention on the conduct of wet-nurses, or servants. A child ought to enjoy the most perfect rest and composure, if it be our wish to promote sound sleep, regular growth, and consequent prosperity. It is equally detrimental to both mind and body, when infants are continually carried about on the arm of the nurse, teased with loud soliloquies, prayers, or other mechanical prattling; and especially when they are incessantly provoked to display their anger or revenge. Such conduct is necessarily attended with a pernicious expansion of infantile powers, blunts their senses, and is ultimately productive of nervous and muscular debility. The tender nerves of children experience a violent stimulus from impressions to which an adult may easily be habituated, or which do not easily affect him.

Vital Principle of Seeds.—A small portion of the Royal Park of Bushy was broken up some time ago, for the purpose of ornamental culture, when immediately several flowers sprung up, of the kinds which are ordinarily cultivated in gardens; this led to an investigation, and it was ascertained that this identical plot had been used as a garden, not later than the time of Oliver Cromwell, more than one hundred and fifty years ago.

A practical farmer—whose livelihood depends upon his calling—should make it the pinnacle of his worldly ambition to excel in it. If he neglects his farm for almost any thing else, he is generally a loser both in interest and credit. Solomon, the wisest observer of men and things, tells us of his disgust at the sight of a slovenly farmer.—“I went by the field of the slothful—and lo, it was all grown over with thorns, and nettles had covered the face thereof, and the stone wall was all broken down.” Owner, where art thou? Perhaps dozing away thy time in slumber and sloth; or spending it at the tavern; or perhaps dreaming of promotion, or engaged in the business of some petty office. Better mind thy own proper business; else “shall thy poverty come as an armed man.” A farmer, on the other hand, who keeps his land and his stock in excellent order, need not be ashamed even were Solomon himself passing by. Every passing traveller no sooner casts his eyes over such a farm than he honors the proprietor in his heart. The proprietor, moreover, is sure to receive for his pains, something that is more solid than plain honor. A comfortable, decent livelihood, for which he is indebted to him only whose is the earth and the fulness thereof.—*Con. Courant*.

From Louton Gardner's Magazine, for March and April, 1823, received at the office of the New England Farmer.

Spruce Beer.—Early in the spring, cut off the young branches of the pine or fir, three or four inches in length, and break them into small pieces; boil them in water and, after filtering the extract through a sieve, add to sixteen gallons of it about six pounds of sugar. It may then by boiling, or evaporating in a hot house, be reduced to a syrup, which will keep in bottles for a length of time. For beer, mix three pints of this extract with thirty of water; boil it for about two hours, and, when cold, put it into a cask, and ferment it in the usual method.

Tea and Balm Tea.—With regard to tea, for which we pay such immense sums to China, it is stated that the first leaves of the whortleberry properly gathered and dried in the shade, cannot be distinguished from real teas. This is the berry on which the black cock feeds, so that by the culture of it we may secure two good things. Be it known to all that John Hussey, of Sydenham, who lived to 119 years of age, took nothing to his breakfast, for fifty years, but balm tea sweetened with honey.—*Art of Preserving Health.*

Bread from Turnips.—Let the turnips first be peeled, and boiled in water till soft and tender; then, strongly pressing out the juice, mix them together, and, when dry (beaten or pounded very fine), with their weight of wheat meal; season it as you do other bread, and knead it up; then, letting the dough remain a little to ferment, fashion the paste into loaves, and bake it like common bread. Some roast turnips in a paper under the embers, and eat them with sugar and butter.—*Edlyn's Misc. Writings*, p. 756.

Cheap Soap.—Potatoes, three parts boiled, afford a very good substitute, especially for washing the hands.—*Bil. M.*

Tinted wooden casks of every description, may be rendered perfectly sweet and wholesome by washing with diluted sulphuric acid, and afterwards with lime water and pure water.—*Journal d'Agric. des Pays Bas*, 1826.

Destruction of Snails by common salt.—M. En Rousseau had applied common salt as a manure to a small piece of garden, and remarked that where snails had come in contact with the salt they quickly died. Wishing to confirm the fact, he strewed some salt upon the ground, and placed a number of snails amongst it; all those which came out of their shells and touched the salt immediately drew out a greenish globular froth, and in a few minutes were dead. The fact may be turned to account by agriculturists and gardeners.—*Bul. Un. and Breach's Jour.* Jan. 1828.

A much more effectual mode of destroying snails, worms, and similar insects, and one with which, unlike salt, there is no danger of injuring plants, is the use of lime water. Nothing astonishes us more than the tardy dissemination of this fact among gardeners.

Destroying Wasps by Tongs.—Many gardeners constantly put a band into their cucumber frames, merely giving them a pan of water, and they find that he clears their frames of slugs and millepedes, or wood lice. It has always been my opinion that toads live on slugs, as they never move out till the evening, when these creatures also are on the move. Can any of your correspondents inform me

if this really is the case, to their certain knowledge?—*Rusticus in Urbe.*

Wire Worms.—I am teased to death with the wire worm in my garden, which seems to revel on the Irides, pinks, lobelias, and plants of that character. I have tried lime, sulphur, salt, potash, soot, all which kill them it is true, but the quantity required would prove a worse remedy than the disease. With a coat of milk like Achilles's, this grub resists every ordinary application, and effects his purposes in security. Do you know of any remedy? I have seen two or three queries in the Magazine, but no reply. My subsoil is a clay, which I fear is an insurmountable evil.—*A. B. B. Cairnbarth.*

☞ We know of no remedy. Burying slices of turnip, potato, apple, or other supposed tempting bait, has been recommended, and taking up the bait every day or two, and picking off the worms till the ground was cleared. A moderate quantity of bait, it is supposed, might clear a whole garden or field. We wish much that some of our readers would try the experiment, and send us the result. They will find farther details in Kirby and Spence's *Entomology*, a work which we have already recommended every master who wishes to keep down insects to procure, and lend to his gardener.—*Cond.*

Yellow Locust.—The Prussian Gardening Society has strongly recommended the culture of the American Yellow Locust tree on poor sandy soils.

A new Horticultural Society has been formed in Paris, who are to issue a periodical journal, entitled *Annals of the Society of Horticulture in Paris, and Journal of the State and Progress of Gardening*. The first number contains articles on a late horticultural fete at Fromont,—on Hybrids—on the Flower Market at Paris—on the Naturalization of Vegetables—on Hotbeds—New Works on Horticulture, &c.

London Market.—The following will give our readers an idea of the prices of Vegetables in Covent Garden Market, London, January 21, 1828. Fine White Broccoli 22 to 40 cts. per bunch of eight to ten heads—asparagus 25 cts. to \$2 per 100—onions 50 to 60 cts. per bushel—English Kidney potatoes \$18 per ton—Newtown pippins 50 cts. per dozen—common kitchen apples \$2 per bushel.

February 9.—Savoy cabbages 50 cts. per dozen heads—horn radish—50 cts.—celery 40 cts. per bundle—carrots \$1.50 to \$2.00 per dozen—Coleworts 50 cts. do.—turnips 62 cts. do.

Dahlias.—A writer in the Transactions of the Prussian Gardening Society recommends the culture of the Dahlia as a beautiful flowering shrub. They may be used as screens, for concealing walls and other fences or unsightly objects, presenting at the same time a beautiful spectacle to the eye by the variety of their colours, from snowy white to the darkest violet, purple blood-red and blackish blood-red, sulphur colour, orange, and scarlet, in all their shades, especially if we can contrive to group the colours in masses.

They are usually propagated by a division of the roots, taking care to have a bud on each tuber; also from cuttings. Seeds are produced by the single varieties in the greatest abundance, and also frequently from the double flowers.—From the progeny of such seeds an endless va-

riety is obtained, two seedling plants seldom having flowers alike. Seedlings, treated as before described, flower the same year in July and August.

The stalks and leaves make a wholesome food for pigs and sheep; they are also eaten by deer and cows, and they are in a dried state, readily eaten by lambs and young goats. When cultivated as cattle food, the stalks may be cut over two or three times in one season. The tubers may be eaten by cattle, but they are neither so agreeable nor so nourishing as those of the common potato.

Palma Christi, or Castor Oil Plant.—This is a tall annual, found native in almost every part of the East and West Indies, South America and China. In Africa, this plant, which seldom rises more than four or five feet high in England, attains the size of a considerable tree. Clusius observed it in Spain, with a trunk as large as a man's body, and fifteen or twenty feet high. Ray asserts that in Sicily it is as large as the common elder tree, woody, and perennial. An oil is expressed from the seeds by the following process: The seeds being freed from the husks, which are gathered upon their turning down, and when beginning to burst open, are first bruised in a mortar, afterwards tied up in a linnen bag, and then thrown into a large pot, with a sufficient quantity of water, and boiled till the oil is risen to the surface, when it is carefully skimmed off, strained, and kept for use. Castor oil is of a pale yellow colour, with little taste or smell; it is often adulterated with olive oil, linseed oil, and poppy oil: it is used as a laxative, acting mildly and speedily, and, unlike other purgatives, its doses may be often lessened when an individual is in the habit of taking it.

DIRECTIONS FOR RAISING LOCUST TREES

Put the seed into a vessel over night, pour hot (not boiling) water on them. In the morning, take them out and spread them—select those that have swelled, for planting; return the remainder into the vessel, repeating the same process the following, and so on for two or three successive nights; taking care each morning to separate the swelled seeds from the others. What remain will probably be imperfect. Sow or plant the swelled seeds in rows three feet apart, on good ground about the time of planting beans—to be hoed and dressed the same as beans.

They are very tender when young, and slight frosts will greatly injure, if not kill them.

RURAL TASTE.

I regard the man who surrounds his dwelling with objects of rural taste, or who even plants a single shade tree by the road side as a public benefactor; not merely because he adds something to the general beauty of the country, and to the pleasure of those who travel through it, but, because, also, he contributes something to the refinement of the general mind—he improves the taste especially of his own family and neighborhood. There is a power in scenes of rural beauty, to affect our social and moral feelings. A fondness for these scenes is seldom found with coarseness of sentiment and rudeness of manners. One may judge, with confidence, of the taste and intelligence of a family by the external air of their dwelling. In my excursions in the country, if I

pass a habitation, however spacious, standing naked to the sun, with nothing ornamental, nothing inviting, around it. I cannot help saying to myself however abundant may be the slovenly possessions of its owner, there is no refinement in that house; there is no delicate and kindly interchange of sentiment among its inmates, and if ever they are so sociable, their sociableness consists in rude and fitful loquacity. Their books are few, and those ill-chosen and unread. But if I notice a dwelling, however humble, which is apparently as snug as its owner has means to make it, displaying neatness and taste in its fences, and shades and shrubbery, and flower pots at the windows,—I feel assured that this is the abode of refinement; it is the home of quiet and rational enjoyment, of intelligent and kindly intercourse.—*Christian Spectator*.

BREAD.

Dr Darwin asserts, that the starch which may be extracted from any given number of pounds of raw potatoes, added to as many pounds of this root when boiled, will make bread equal to that made from the best wheat flour. The boiled potatoes are to be mashed fine, with the starch, in its wet state, added to them, and then to be made in the manner of wheat bread. An equal number of pounds of wheat flour, and of boiled potatoes well mashed, will also make good bread. Or, instead of potatoes, boiled turnips, well mashed, and the juice mostly squeezed out, will answer very well; but in such case the bread is to be kept about 24 hours, before eating, by which time it will lose the taste and smell of the turnips. They are to be peeled before boiling; and the potatoes are to be skinned before they are used.

Take twelve ounces of rice, boil it till quite soft, strain off the liquor (which makes the best of starch) add the rice to four pounds of wheat flour, and the whole, when made into bread in the usual way, will weigh seven pounds; so that this addition of boiled rice gives upwards of a pound more of bread, than if four pounds twelve ounces of flour had been used for the purpose; and the bread made with the addition of the rice is equally good as that made entirely of flour, and will keep most considerably longer. It, however, requires a little longer time in the process of rising.

There is also a still greater addition to be made to the weight and quantity of wheat bread, by boiling the bran, which is separated from the flour in bolting, and kneading up the whole boiled mass with the flour. The bran should be boiled about twenty minutes, by which operation its weight and its nutrimental qualities are greatly increased;—and when cooled to lukewarmness it may be added to the flour to be made into bread. Or the water in which the bran is boiled may be pressed out, and added to the flour; and this of itself will make a very considerable addition to the weight and quantity of the bread.

Stale bread is more wholesome than that which is newly baked, as the latter contains a large proportion of indigestible paste; which may, however, be rendered less hurtful, by toasting.

To make bread with salt—Take as much of this article as is necessary for the quantity of bread to be made; dissolve the salt in a quantity of warm water sufficient to mix the flour intended to be baked; mix some flour in this water, and set it in a pot near the fire; but not so near as to burn the flour: A yellow water will soon rise on the top, which is to be taken off, and the rising

will begin; then mix the contents of the pot with the flour, add more warm water, if necessary, and in less than an hour the mass will be ready for baking; and when baked will be found as well raised and tasted as bread raised with yeast.—From three to four hours are requisite in this process, from the time of first preparing the salt and water.—*Farmer's Assistant*.

STEEL.

A discovery has, it is stated, been made in the arts in Paris, which promises to be of the highest importance. An English gentleman has succeeded in making the best shear steel from M. Crawshaw's common No. 2 iron. He asserts that by his process he is able to convert the very worst of any country into shear steel. If this result be obtained from iron of an inferior quality, it may be expected that from the best iron a still superior quality of steel may be obtained, so as shortly to supersede the necessity of applying to Sweden for iron. A knife of this steel is described as of a temper to cut iron like wood, and a file to be superior to all preceding manufactures. It appears that by the new process the steel acquires a greater degree of hardness than by the former method, while it is also much tougher, therefore highly valuable for mining operations. This gentleman is coming to England to communicate his discovery, which ought to be made generally public.

London paper.

Temperance.—The Temperate Society of Hartford, Vt. in their annual report, state that the diminution of the sale of ardent spirits in that town the last year was nearly *one half*. The sales amounted to \$5000 in 1826, and only \$2,659 in 1827. The quantity consumed is still alarming, although many have entirely abstained. Farmers have tried the experiment of abstaining entirely from using and furnishing ardent spirits, and their experience is decidedly in favour of abstinence. They find no difficulty in hiring laborers; their fields are free from babbings and contentions; their work is done quicker and better than formerly; and they believe that the man who drinks but a single glass during the day will lag behind those who abstain, before night. Buildings have been raised, sheep washed, and all kinds of business performed, without the aid of ardent spirits. Some of the farmers who had laborers that loved rum, told them that their crops should rot on the ground, if they could not be gathered without the help of rum. When this point was settled, they had no further difficulty. Men who had long been accustomed to use spirits discontinued the habit, and were much satisfied with the result.

Buildings have lately been raised in Belchertown, Westfield, and other towns without the use of rum. There was no difficulty in finding men to assist in the work.

The great cause of temperance is advancing.—Those who think at all, see that something must be done, and that all expedients except *entire abstinence* are useless. "Let not the friends of temperance give back. The only word is, *press on*. The progress may be slow, but it is the march to victory.

Dr. Physic, of Philadelphia, says he believes the use of Liverwort, for the cure of consumption, is nothing but quackery; and he thinks it will do more hurt than good.

Exportation of ice.—The business of exporting ice in cargoes to the West Indies, originated in Boston about twenty years since. The first person, (Mr. Frederic Tudor) who engaged in it, had many difficulties to contend with; no insurance could be had on his vessel—sailors were unwilling to go on a voyage so hazardous, and the community sneered at the project. He finally surmounted all opposition and prejudice. Many vessels are now employed in transporting this product of our northern winters to tropical countries, and in returning home laden with their valuable productions.—*Hamp. Gaz.*

Broad rimmed wheels for stages and carriages of burden are fast coming into use in Massachusetts.—*Hampshire Sen.*

Chimney Swallows.—Mr. Dan'l. Butler had been annoyed for some days by a noise in the chimney of his store, made by large numbers of swallows; which, by the vibration of their wings acting on the confined air, occasioned a rumbling like distant thunder. On the 28th ultimo, his son and another person made an opening from the lower part of the chimney into the counting room, then ascended the roof, and by letting down into the flue of the chimney a board fitted so as to nearly fill the passage, drove 256 swallows into the room, where they clung to the walls, windows, &c. They were caught and put into a box with open places on one side for the admission of light and air. The next morning the board was again used, and 119 swallows were forced down into the room and placed in the box with the others, making in all 375. So many of these little birds in one cage presented a novel sight. They adhered to the sides, and clustered together at the corners hanging upon one another like a swarm of bees. They were released from confinement the same day, and resumed their twittering notes and rapid flights. Chimney and barn swallows destroy legions of insects, but never attack the produce of the soil.—Did they fail to make their appearance, our buildings and crops would be overrun with insects.—These harmless birds amply repay us for sheltering them, and it is impolitic and cruel to destroy them.—*Hampshire Gaz.*

Beetles.—These are very common—their eggs are deposited in the ground by the parent insect, whose fore legs are very short, and well calculated for burrowing. From each of these eggs proceeds, after a short time, a whitish worm with six legs, a red head, and strong claws, which is destined to live in the earth under that form for four years, and there undergoes various changes of its skin, until it assumes its chrysalid form. These creatures, in immense numbers, work between the turf and the soil in the richest meadows, devouring the roots of the grass to such a degree that the turf rises, and will roll up with almost as much ease, as if it had been cut with a turfing knife;—and underneath, the soil appears turned into a soft mould for above an inch in depth, like the bed of a garden. In this the grubs lie, in a curved position, on their backs, the head and tail uppermost, and the rest of the body buried in the mould.—Such are the devastations committed by the grubs of the cockchafer, that a whole field of fine flourishing grass, in the summer time, became in a few weeks withered, dry, and as brittle as hay, by these grubs devouring the roots, and gnawing away all those fibres that fastened it to the ground,

and through which alone it could receive nourishment. The larvae having continued for four years in the ground, are now about to undergo their next change; to affect this, they dig deep into the earth, sometimes five or six feet, and there tap a smooth case, in which they change into a pupa or chrysalis. They remain under this form all the winter, until the month of February, when they become perfect beetles; but with their bodies quite soft and white. In May the parts are hardened, and then they come forth out of the earth. This accounts for our often finding the perfect insects in the ground. The most efficacious mode of preventing their increase is to employ proper persons to take the flies in May and June, before they have laid their eggs; which, though it appears an endless task, may be done with very considerable effect, by shaking and beating the trees and hedges in the middle of the day. Children will be able to do this—and, as has been proved by experiment, will, for a trifling reward, bring some thousands per day gathered in a single village. Domestic fowls of all kinds are particularly fond of these beetles, so that the expense of collecting them would be fully compensated by the quantity of food they would afford in this way. When land is ploughed up in the spring, if the weather be warm, hundreds of the chafers grubs are exposed—in which case, crows, gulls, and jays will be sure to detect and devour them. These birds, therefore, should not be driven away, as the occasional damage they commit is amply repaid by their unceasing exertions to destroy various insects. The almost sole employment of crows, for three months in the spring, is to search for this sort of food, and the havoc that a numerous flock makes amongst them must be very great.—*Loudon's Ency.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 13, 1828.

To CORRESPONDENTS.—An interesting article from a correspondent of *Stockport*, (Penn.) giving a history of the American Apple Tree, will appear next week—likewise an article on raising water.

MONSTROUS PRODUCTION.

A reptile resembling a leech but much larger, was lately extracted from the oesophagus or gullet of a cow belonging to Mr. Jacob Dickman, of Hopkinton, Mass. The insect was *twenty-two and a half inches long*, of a flesh color, and, in form like the leech used for medical purposes. It was extracted from the throat of the cow after the death of the animal, of which the monster is supposed to have been the cause. It was probably swallowed by the cow in drinking, and contrived to fasten itself in the position from whence it was taken.

THE BOSTON ELM.

In page 218 of the current volume of the *New England Farmer*, we gave the letter of Messrs. Thorburn & Son to Patrick Neill, Esq. Secretary of the Caledonian Horticultural Society, accompanying a painting of the Great Elm on Boston Common, presented by the former gentlemen to the Society. We have been politely favored with the following answer:

"Extract from the Minutes of the Caledonian Horticultural Society, March 5, 1828.

"A letter from Messrs. G. Thorburn & Son, of

New York, was read, announcing a present to the Society of a painting of the great Boston Elm, and also of specimens of the different varieties of Zea mays or Indian corn. Cordial thanks were voted for these obliging presents."

P. NEILL, Sec. Caled. Hort. Soc.

The following note was likewise addressed to Messrs. Thorburn & Son, by Mr. Neill:

"The painting is placed in the Council room at the Experimental Garden. I regret that no figure of a man or a horse has been placed close to the base of the trunk, for this would at once have been an index to the relative size and bole of the whole tree. An account of its dimensions and some seeds from it would be very acceptable. Any thing that can be furnished from our Experimental Garden, you may depend on our sending when we learn your wishes."

EARLY PEAS.

The following fact respecting early Peas, was obligingly furnished us by Mr. HAYWARD, clerk of the Boston Faneuil Hall Market.

Jan 11, 1827—There were more Peas in Faneuil Hall Market than could be sold for 25 cts. the peck.

June 11, 1828—There were but very few Peas in the Market, which sold from 75 cts. to \$1.00 the peck.

SALE OF WOOL.

On Tuesday last the sale of foreign wool, by Messrs. Coolidge, Poor & Head, took place in the hall over the city market. The company was numerous, and the article went off with spirit.—There was a small advance on Portuguese wools; and the Saxon and Spanish realized the prices they have borne at the two or three last public sales. About 900 bales of the latter and 155 of the former were sold. Merinos brought 50 cts. and a lot of choice selected Saxony fleeces 62 cts. Very little fleece wool was offered.

The British Government has determined not to raise the duty on Wool. Ministers say they cannot do it consistently with the interest of Manufacturers. A committee has been appointed to inquire into the causes of the depression of the Wool Trade.

Green Peas, the produce of this county, were brought to our market on Friday evening, the 6th. inst. raised by Mr. Samuel Budlong, and Benjamin Hill, of Cranston, and purchased by Mr. Hodges of the Franklin House, at *eight dollars per bushel*. On Saturday morning, peas were brought to market by Leonard Sweet, of Fruit Hill, and Mr. Samuel Barlingame, of Cranston. In 1826, the first green peas were sold in this market on the 29th. of May, and in 1827, on the 4th. of June.

Fresh Salmon was offered in our market on Friday, and purchased by Mr. Lawton, for the table of his hotel at 50 cents per pound. Not more than 30 years since, this fish was common in many of our rivers; so common, it is said, in some parts of the country, that a special clause was inserted in the indentures of apprentices that they should not be compelled to eat salmon oftener than once a week. We believe most of our apprentices would now like to insert a clause providing a dinner of this fish occasionally.—*Prov. Journal*, June 9.

Histories of the towns of Scituate, Weymouth, Lynn and Concord, are in preparation.

MILLET.

This is a round, yellowish white grain, which grows in panicles at the top of the stalk. The stalks and leaves are like those of Indian corn, but smaller. It grows to the height of three or four feet. A sandy warm soil suits it best. It should be sown about the middle of May, in drills three feet apart. The plants should be so thinned at the first hoeing as to be about six inches apart in the rows. It will produce as large crops as Indian corn, and bears drought admirably well.—Cattle are fond of eating it green, preferring it to clover. A crop of it sown thick, and mowed green, makes excellent fodder.

Some say a crop may be obtained by sowing it at about midsummer. Perhaps it may be so in hotter climates. I tried the experiment in the 44th degree of latitude, and the crop was little better than mere chaff, for want of continuance of heat to fill the grain.

This grain appears to be subject to no distemper; but when it is nearly ripe, the birds are apt to get a great deal of it, if it be not watched carefully.

The way to harvest it is, to cut off the panicles with a knife, near the uppermost joint of the stalk, put them into sacks or sheets carry them to the barn floor, and empty them into heaps, covering them with cloths. After lying five or six days, it must be threshed and cleaned. It should be dried well in the sun, before it is stowed away in the granary; for it will not keep well with any moisture in it.

Millet is an excellent food for fowls and swine; for the latter it should be ground into meal;—Some mix it with flour in bread; but it is better for puddings. There is also a red sort of millet; but this I have never seen.—*Dean's N. E. Farm.*

EMIGRATION.

It appears to us very doubtful that any permanent relief can be obtained for G. Britain by emigration. The number of emigrants, for such relief, would require to be very great—not less than a million or two; and this export of human beings would be again necessary after the lapse of 30 or 40 years, on the scale the population increases at present.

While there is every reason to doubt any permanent advantage to G. Britain, there is fully as much reason to doubt it in respect to the Colonies. A large addition of able-bodied, intelligent and industrious settlers would, no doubt, in some years, add to their wealth; but at first, the paupers, who will form the majority of emigrants, and who have to unlearn their old habits, and serve an apprenticeship to a new occupation, will be burthensome to the Colonists, as indeed they have already deplorably been.—*Quebec Gaz.*

A NEW AND CHEAP PAINT,

More impervious to the weather than common paint.—Take of unslacked lime a quantity sufficient to make two gallons of white wash when slacked—mix it with a due quantity of water—add to it 2½ lbs. of brown sugar, and about 3 oz. of salt. The exact proportion of each will be best ascertained by experiment. This when applied as a paint, becomes perfectly hard and glossy—by mixing either ivory black or lamp black with the ingredients, a beautiful lead colour may be had, or a yellow by mixing suitable ingredients—this paint is now almost altogether used at the south for houses, fences, &c.—*N. Y. Com. Id.*

GEOLOGY.

A few individuals who attended Mr. Holbrook's Geological Lectures express themselves in very favorable terms respecting his competency and intelligence as a Lecturer. The subject has been so little attended to among us, that many persons otherwise well informed, are, or were until very lately, entirely ignorant of its meaning. The uses to which it may be applied are various, and many of them important. Its application to agricultural pursuits, and its utility in ascertaining the nature of soils, would alone give it a sufficient consequence to attract the attention of our farmers. Its connexion with many branches of manufacturing, such as glass works, porcelain, &c. entitle it to consideration; and one of its most interesting features is its easy adaptation to the purposes of amusement, for the younger part of the community. It is obviously a desirable point to mingle, as much as may be, instruction with relaxation, and it cannot be doubted that the collection of a little cabinet of the stones and minerals in this vicinity, and familiarizing themselves with their names, ingredients and uses, would unite these two objects in a very pleasing manner. Such an occupation would, we think, be a very acceptable and useful substitute for the idle, sauntering, and sometimes mischievous manner in which too many young people spend their hours of relaxation. We hope the opportunity now offered to acquire some information on this interesting subject will not be suffered to pass unimproved.

COLLECTION OF MINERALS.

Mr. Holbrook will be able in a few weeks to furnish Schools, Academies, Associations, or individuals, sets of specimens in Geology and Mineralogy. Each set will contain specimens of one hundred of the most useful productions in the mineral kingdom, embracing the varieties of Granite, Slate, Soap stone, Marble, Coal, Ores of Iron, Copper and Lead, with some of the more rare Minerals, but all applied to some use in the arts.

Each specimen will be labelled and numbered, and a description given, of its ingredients, properties, uses and localities, in a small volume which will accompany each set.

Any communications upon the subject, directed to Josiah Holbrook, at Boston, will be received and attended to.—*Bosser Register.*

It is a curious fact, proved by one of the most eminent medical men living, that the number of suicides is less in a given number of persons in this country, than in any other country in Europe.—France affords the largest number, and we believe, Prussia the next. The suicides at Paris during the last year are stated at 1765, of which 913 were occasioned by gaming.—*London pa.*

In a hot bed in the garden of the U. S. Hotel, 4 feet by 6, there have been raised the present season 2150 cabbage plants, 900 celery plants, and fifty pepper plants, in a healthy condition for transplanting. These plants, at the usual prices at which they are sold, amounted to \$20 88.—*Savannah Sentinel.*

John Gowen, an old offender, who had previously served seven years at Botany, was transported for life, at the Sussex Sessions, for duck-stealing when sentence was pronounced, he threatened to thrash one of the witnesses on his return!—*London paper.*

The latest Liverpool papers mention the sailing of several more vessels for New York with emigrants—some farmers, some laborers, and some paupers. Few go to the British Provinces—but great numbers to the U. S.

Isaac Van Wart, (lately deceased,) one of the captors of Maj. Andre, supposed a monument would be erected over his remains, and directed their interment where there would be room, without covering other graves.

There is to be a Grand Procession at Baltimore on the 4th of July, in celebration of the day, and the commencement of the Great Railway which is to be shot to the Ohio. The different trades are requested to attend.

The freshest in this river, demolished nearly all the ice-houses on the wharves in this village, and swept off about 2000 cords of ice, then about to be shipped for a market at the south.—*Gardiner (Me.) paper.*

It now costs, to deliver a ton of merchandise from London to Lake Erie, by the way of the St. Lawrence, 6l. 15s.; by way of New York and the Erie Canal, not quite 5l. On the completion of the Canals by way of the St. Lawrence, it will be done for less than 3l. per ton.—*London pa.*

A writer in the Bunker Hill Aurora recommends the erection of a new bridge over Mystic River, between Chelsea and Medford Bridges.—Warren Bridge is commenced.

A Steam-Boat is to be established to ply between Fredericksburg and Baltimore—and one to ply between Charleston and Savannah.

The Gardiner Chronicle strongly urges the farmers of Maine to commence the cultivation of Hemp on a great scale, as the Tariff Bill has passed.

About \$1,400 000 in specie have been lately brought to England from India, and \$4,000,000 more are expected. This is a reversed trade.

A poor Scotchman, applying for parish assistance for two children, was asked how many he had. "Twenty-five," said Sandy, "and I now have a 4th wife." In Turkey a man may have as many wives as he can maintain—in Scotland more children it seems.

The ship Champion lately arrived at Charleston, (South Carolina,) from New Orleans, with a cargo of hay.—*Bos. Pala.*

On Friday last, some person, unknown, sent a Bank Bill of \$300 to a Representative as a present.—*Ibid.*

For Sale.

A valuable real estate in Milton, pleasantly situated, 9 miles from Boston, on the turnpike road leading from Boston to Milton, Bridgewater and New Bedford, containing about 300 acres of the variety of lands, and fruit suitable for a good farm, well watered, with good substantial and convenient buildings. Said farm is calculated to suit a gentleman of taste—or an enterprising young man for a milk establishment, being an excellent grass farm. The purchaser may have with the buildings from 400 acres to the whole. Purchasers are requested to come and examine the soil and crop at this season's possession may be taken at any time from this to the first of April next. Conditions liberal. For further particulars inquire of the publisher of the N. E. Farmer.

Milton, June 10, 1838.

Cucumber Seed, &c.

Just received at the New England Farmer Seed Store, a further supply of Green and White Turkey, White Spanish, Long Prickly, and small West India Girkin Cucumber Seed—the latter is a fine sort for pickling, and should be planted soon.

Barrel and Scrab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barrelet, a high-nut horse, is as follows:—

FOAL'D 1820.

Barrelet, by Trump, dam Resound by Buzzard, out of Roseberg, sister to Huley and Tartar, by Phenomenon, out of Miss Vest by Matcham—Regulus. Cud—Chadders—Lustad.

In 1822, when at Pontefract, sweepstakes of 20 g. each, for two years old—31 sals. Barrelet beating Harpouner.

In 1823, York Springs St. Ledger, of 20 g. each, 4 sals.—Barrelet beating four others—A, Pontefract sweepstakes of 30 guineas each ten feet, 10 subscribers. Barrelet beating Palatino.

In 1823, the Doncaster great St. Lodgers, of 25 g. each, 50 subscribers. Barrelet out of 11 others.

In 1823, at New Market, Barrelet won a handiicap plate value £50, beating Freshetina and five others.

In 1824, at Ascot Heath, Barrelet walked over for the Swinlas stakes, of 25 sovereigns each, 3 sals.

In 1825, at Lancaster, the gold cup, value 10 g. added to a sweepstakes of 10 sovereigns, 17 sals. of all ages. Barrelet beating Linton and two others.

In 1825, at Manchester, Handicap stakes of 20 sovereigns each, 10 ft. with 20 sovereigns added—6 subscribers—Barrelet beating two others. At Lancaster, the gold cup, value 100 g. added to a sweepstakes of 10 sovereigns each, 5 sals.—Barrelet beating two others.

FOAL'D IN 1821.

Scrab, (a beautiful bay Horse.) FOAL'D IN 1821. Got by Phanton out of Jesse, by Wateridge—her dam Cracker by Highdyer, out of Nutcracker, by Matesum.

In 1824, won the New Market stakes, 50 g. each 21 sals.—Scrab beating four others.

In 1825, at the New Market Crone meeting, the stakes, 100 sovereigns, 7 sals. Scrab beating two others. The same year, Spring meeting, Scrab won Handicap sweepstakes, 100 sov'ns 6 sals, beating three others.

In 1825, Scrab won Kings Plate, 100 g. beating 30 others.

In 1827, Stacion, Scrab won the gold cup. 113

MISCELLANIES.

From the Boston Statesman.

I remember, I remember,
The place where I was born.—T. HOOT

My birth place! Oh my birth place.

The house beneath the hill;

The moss upon the sloping roof.

The trickling of the rill,

And the artificial water fall,

That turned my little mill.

My birth place! With its spreading tree

In parlor windows low,

The floor which opened to the sun,

Through which I used to go—

And the creeper climbing to the top

And hanging over so!

I dreamed of it—my birth-place—

And went again to see—

The moss upon its sloping roof,

The shadow of its tree—

Was! that only in my dream

That pleasant sight should be

Deerly had left its shade.

Its pleasant tree was gone;

The mossy roof had fallen in,

The tree was overgrown;

And the creeper tangled with the weed.

Across the stepping stone.

The bank on which I used to drink,

The grass I used to fling

My satchel and my cap upon,

Were seen and withering;

And the trunk was broke that led away

The water from the spring.

I could not pass the broken door,

And sadly turned to stray

Where leaped my little water fall,

But that was swept away;

And the soft green meadow had been ploughed

In which I used to play.

My birth-place! Oh, my birth-place,

I never more may see.

The happy lions my childhood saw

Beneath your spreading tree

I would I were as innocent

As then I used to be.

School dialogue.—The following conversation is said to have taken place in a school-house:

BOY—(reading) T e-n.

TEACHER.—Well, what does t e-n spell?

BOY.—I don't know, sir.

TEACHER.—What does your mother drink at breakfast?

BOY.—Rum, sir.

The Argus gives the following dialogue:

BOY.—(reading) G-l-a-s-s.

TEACHER.—Well, what does that spell?

BOY.—Don't know.

TEACHER.—What is in the window at home?

GOR.—Why, dad's old breeches.

The miser's prayer.—Among a variety of curious papers of John Ward, Esq. [of Hackney,] M. P. (who being convicted of forgery, was expelled the House, and in the year 1727 stood in the pillory,) there was found, a short time since, a paper in his own hand-writing, which, we think may be very properly entitled the miser's prayer:

"O Lord, thou knowest that I have three houses in the city of London, and likewise that I have lately purchased an estate of fee-simple in the county of Essex; I beseech thee to preserve the two counties of Middlesex and Essex from fire and earthquakes; and as I have a mortgage in Hertfordshire, I beg of thee likewise to have an eye of compassion on that county, and for the rest of the counties thou mayest deal with them as thou art pleased. O Lord, enable the bank to answer all their bills, and make all my debtors good men.—Give a prosperous voyage and return to the Merchant sloop, because I have insured it; and as thou hast said that the days of the wicked are few, I trust in thee that thou wilt not forget thy promise, as I have purchased an estate in reversion, which will be mine on the death of that most profligate young man, Sir J— L—. Keep my friends from sinning, and preserve me from thieves and house-breakers; and make all my servants so honest and faithful that they may attend to my interest and never cheat me out of my property, night nor day."

Ward was suspected of joining in a conveyance with Sir John Blunt, to secure £50,000 of that director's estate, forfeited to the South Sea Company. The Company recovered the £50,000 against Ward, but he set up prior conveyances on his estate to his brother and son, and concealed all his personals, which were supposed to be £1,020,000. These conveyances being also set aside by a bill in Chancery, Ward was imprisoned for many years.

Social intercourse.—We should make it a principle to extend the hand of fellowship to every man who discharges faithfully his daily duties—who maintains good order—who manifests a deep interest in the welfare of society—whose deportment is upright, and whose mind is intelligent, without stopping to ascertain whether he swings a hammer or draws a thread. There is nothing more distant from all natural rule and natural claim than the reluctant feeling—the backward sympathy—the forced smile—the checked conversation—the hesitating compliance, which the well off are too apt to manifest to those a little lower down; with whom, in comparison of intellect and principles of virtue, they frequently shrink into insignificance.

Dyspepsia.—It is melancholy to see the number of the fair creation daily augmented, who fall victims to this enemy of sedentary habit. A thousand and one sovereign remedies are daily advertised by quacks and apothecaries; but, expensive as they are, we believe little benefit is derived from them. We, however, though not a disciple of Galen do know an effectual remedy that it is worth all the nostrums invented since the flood, and we most cheerfully offer it to the consideration of the ladies, gratis. Rise at four, and walk two miles at a quick step. Do not saunter—that is worse, if possible, for the constitutions, than no exercise. Follow this one month, and if it does not regulate digestion—restore the spirits, and produce a countenance blooming as the rose, we will give our head for a foot-bald. The season for rambling is now in perfection—the medicine costs only a little exertion—ladies will you try it? Only make it fashionable to rise early and walk before breakfast, and we shall cease to hear of dyspeptic affections.—*Boston Times.*

Field Beans.

For sale at the New England Farmer Seed Store two barrels of small white prolific Field Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and are all of the growth of 1827.

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in papers of six and a quarter cents each; likewise some in packages comprising 20 varieties, each sort being labelled, at \$1 per package.

Bull Bolivar.

The high bred imported Improved Short-horned Bull Bolivar, will stand at the subscriber's stable in Charlestown, Mass. Price \$5 for each cow in the season. This bull was selected by Mr Coates, the keeper of the Herd Book, without limitation of cost, for the use of the Powchown stock, and is so highly valued by Col. Powell, that he has always refused to sell him, and has consented to part from him but for a season, considering him in form, points, and pedigree, equal to any animal to be had in Great Britain.

Bolivar is red and white, is not three years old, and has never been forced; yet he gets immediately behind his fore legs 7 feet 3 inches. The singular neatness of his shoulder, the straightness of his back, the width of his loin, the smallness of his head, neck, and tail, the quanness of his gait, together with the well known character of his family as dairy stock, render him one of the most desirable males for improving our local cattle, that ever in any country he found.

SAMUEL JACQUES, Jr.

Valuable Stock.

For sale 7 Heifers, 2 and 3 years old, raised from some of the best Cows in this State, by Denton. Five of them have brought Calves this spring, and bid fair to make excellent milkers. They were selected by the present owner from the best of west cts, to be kept on his own farm, and are offered for sale in consequence of his having disposed of his farm. They are worthy the attention of any farmer who wishes to obtain good stock.

Also, 2 Horse Colts, 1 and 2 years old, by the imported horse Roman from excellent mares, well known in this city. Apply to the publisher of the N. E. Farmer. June 13

MILLET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of *superior quality* gentlemen in want of this article are requested to call and examine it.

Also, a large supply of Orchard Grass, Lucerne, Fowl Meadow, Mangel Wurzel, Sugar Beet, Riga, Russian Flax, Lima Beans, &c. with several new varieties of Turnip Seed from Europe including the Yellow Malta, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh White Mustard Seed—Also, Green Citron, Pine Apple, and Pomgranate Musk Melons, Carolina and Long Island Water Melons.

A further supply of Double Mexican Dahlias, 100 Single Dahlias, at the low price of 25 cts. each root.

New Variety of Radish.

For sale at the New England Farmer Seed Store, a few pounds of Long White Summer Naples Radish, a variety highly esteemed in the Southern States.

Bull, Young Comt.

This noble animal, (of the new improved Durham short horned stock) is from *Abigail* and *Amabilis*, presented to the Massachusetts Society for the promotion of Agriculture, by Sir Isaac Coffin, at an expense of near one thousand dollars, for the purpose of improving the breed of cattle in his native State. He will remain at the farm of E. H. Derby, Esq. in Salem, and by the direction of the Trustees of the Society, he is to be used at \$3 for each Cow, payable in advance. The whole proceeds from this animal, (the present season) will be for the benefit of the Society. Cows sent from a distance will be taken care of, if desired, at a reasonable charge.

Ginpowder, &c.

Du Pont's Gun Powder, at 25 to 50 cts per pound—Shot—Ball—Plugs and Percussion Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Dipnot Powder Store*, No. 60 Broad street—By E. COPPELAND, Jr.

Ⓕ The Du Pont salt as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the sack. March 14

This day Published,

And for sale by S. G. Goodrich, No. 11, Washington-street,

THE LEGENDARY—Vol I.

Consisting of Original pieces, in prose and verse, principally illustrative of American history, scenery, and manners. Edited by N. P. Willis.

It is proposed to continue this work, and to publish a volume once in 3 or 4 months, if the encouragement is sufficient. The volumes will be sold separately—price \$1.25 per vol. j 6

Published every Friday, at \$3 per annum, payable at the end of the year—into those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

FOR THE NEW ENGLAND FARMER.

HISTORY OF THE APPLE TREE.¹

TO SHOW THAT THEY ARE NATIVES OF PENNSYLVANIA, IF NOT OTHER PARTS OF THE U. STATES.

I shall begin with the original Indian apple tree that grew within three miles of the spot of my nativity, say thirty-four miles a little east of north from Philadelphia, called the *Townsend apple*, from the following circumstance.

See Robert Roun's History, vol. I, p. 228, that in the same ship with William Penn, in the year 1682, came from London, Richard Townsend; he was a famous Quaker preacher, religiously concerned to cultivate the friendship and better the condition of the native Indians; in which concern reports have said that he devoted much time in travelling. For the history of the original apple tree, I have had it traditionally, from the family of Richard Townsend's descendants, who were deemed a family of first rate respectability.

Stephen Townsend, (grandson of Richard) was an elderly and amiable man in my time, and owner of the apple tree. I have heard him relate that his grandfather had been informed by the Indians, that back in the country was a great apple tree, where abundance of Indians collected in the season to live on apples;—that with Indian guides he undertook the journey through the wilderness, to pay them a religious visit. When he came there, he was surprised to see so many Indians. There was a spring of good water near by, and an apple tree in an Indian clearing, vastly larger than any he had ever seen in England, heavily loaded with larger and better apples than he had ever seen before;—that his ideas were to take up a tract of land there for his descendants, provided the Indians would sell him what was called their good will, or claim to their clearings, which was then customary to give, to support their friendship; to that they agreed, (as to the soil) but no consideration would purchase their apple tree.—That they strictly reserved to be as free as sunshine to all or any who wanted apples. That part of the contract, the Townsend family ever faithfully observed; and Stephen Townsend did more, he supported a strong fence round it to keep cattle from the falling apples, and used to haul and throw his buck-wheat straw under the tree, to keep such as fell from high from sprouting.

The apples were very large and fat, of a yellow color, striped, and specked with red, of a rich delicious flavor neither very sweet nor sour; generally esteemed to this day, in preference to any other. I have a great plenty of them in my orchard; but I think they are depreciated in size, say one third; but not lost their former delicious flavor, or luxuriant growth of limbs and abundant bearing.

It is now some months upwards of sixty years, since I cut grafts off the original tree, and set them in young trees, from which grafts were brought here.

I never measured the tree, and shall forbear mentioning my ideas of the size or quantity of apples that I have seen under it, lest I may be thought extravagant.

I well remember being there when very young, and a company of the better informed old men were viewing it, and hearing them say, that according to the growth of trees, that apple tree must be much older than Columbus.

From whence the seed of that apple tree, or when the Indians cleared a field round it, is in the dark unknown; it stood on a poor thin gravelly soil, and verifies the maxim, that temperance promotes long life.

Thirty-eight, seven, or six years ago, I heard that venerable tree was fast declining. I wrote to a confidential friend of mine, (near by) that if it died or fell down, to saw it off and count its growth for the age. His answer was, it turned up by the roots; that they sawed it off and found it so hollow, rotten, and inwardly defective, that nothing could be done to establish the age.

Another native apple tree, I may mention, I have heard the oldest people of my remembrance, say, that it was the practice whenever there was what they called a *new comer*, for the neighbors to unite, go, and make him what they called a *beginning*; that was, grub and clear a small piece of ground—put up a little log-house, and cover it with bark, &c.

There came a man from England, whose name was George Hayworth; his tract was within two miles of where I was born. I have heard some very old men say they were at that first *grubbing*; that the whole tract was thick timber, no sign of Indian clearing to be seen.

While at work, they found a large old apple tree in the woods, overshadowed with forest trees. They united, cleared around it, and made a fence, then pronounced it public property; and as such, it was considered in my time.

From some ancient documents that I have seen, that *improvement* was made in the year 1714.—The tree happened to bear delicious white sweet apples, more early than any other known; as the seeds are generally turned brown in wheat harvest. That tree, although it grew on a fertile soil, never assumed a free, lively, growing appearance; as I have cut grafts from it. It died about the same time of the Townsend tree; also hollow and rotten.

If the Townsend apple have decreased in size, the Harvest sweets have increased; and the trees grow luxuriantly.

Dr. Darwin says, "grafting is the elongation of the same tree." I have the consolation of having re-delongated two species of original American apple, independent of any seed or affinity with any European apple whatever; and perhaps I may be the only person that has preserved them, as I brought these grafts from the place of my nativity. They have had a general mortality amongst their apple trees.

My orchards would now afford, without doubt, by far more grafts of both kinds, than will ever be wanted; and I have been sorry, many years, that I had no conveyance, to send a box of grafts to my venerable friend, Col. Timothy Pickering.

I wish to hear through the medium of your Farmer, the opinion of your antiquarians—were apples natives of New England?

Should life and health permit me to write a-

gain, perhaps I may show a strong hypothesis—that apple trees abounded amongst the native Indians in one part of Pennsylvania, for perhaps centuries before the continent was discovered by Europeans.

FOR THE NEW ENGLAND FARMER.

RAISING WATER.

MR. FESSENDEN,—I wish to ask through the medium of your useful paper, whether water can be raised by means of a pump, from a fountain at a distance, through logs or other conductors? And if it be practicable at all? At what height it can be raised? and what distance? Are earthen or leaden pipes preferable, for conductors? and may not logs be so prepared as to answer every purpose?

It is very difficult to dig wells in this section of the State, by reason of a ledge, which seems to pervade nearly the whole of it.

It seldom breaks out into rugged cliffs, but often appears at the surface; and in digging wells, is often found before sinking ten feet. Wells have been dug in the ledge; but the water, although good at first, soon becomes bad. A very sensible alteration is sometimes perceived in the quality of the water in those wells immediately after heavy thunder.

The ledge is generally a lime rock, but not of the purest kind. It lies in thin strata, seldom exceeding six inches in thickness. The strata are nearly perpendicular, inclining south, from five to twenty degrees, perhaps.

In this position, it is very difficult to perforate, as powder cannot be made a very efficient agent. An eligible site for building, is, therefore, a very inconvenient place for procuring good water.

If any means of drawing water from a distant fountain—where that fountain is so low as not to be accessible by the common aqueduct, can be had, which will promise durability, it will add much to the value of many farms in the county of Penobscot.

By answering the foregoing inquiries, you will confer a favor on many in the county of Penobscot, and particularly oblige

A SUBSCRIBER.

Penobscot, June 4, 1828.

By the Editor. What is called *suction* in pumps is produced altogether by the action or pressure of the atmosphere, on the outside of the pipe or pump-stock in which the water ascends. In order that this pressure on the out-side (which amounts to about fourteen pounds on every square inch of the surface of the water) may not be counterbalanced by a similar pressure inside of the pipe or pump-stock, it is necessary to exhaust the air, or pump it out of the pump-stock in which the water ascends. It makes no difference whether the channel or water course rises perpendicularly from the fountain, well, or reservoir of water, or be inclined in any angle. One end of a leaden pipe, for example, may be placed in a fountain, and the pipe may be carried or protracted thirty rods more or less, in a horizontal or ascending direction, and the water delivered by pumping it

out at the end farthest from the fountain. Care must be taken that the pipe be perfectly air tight through its whole extent, and that the end of the pipe through which the water is delivered by the action of the pump is not more than thirty-three feet perpendicular height from the fountain. If the pipe or pump-stock is very long, it may require considerable time and labor to exhaust the air through its whole length, and it has been found by experience that a pipe of nearly half a mile, not carried in a direct line from the well to the place of delivery, is liable to inconveniences. If the pipe waves up and down, the air and water, it is said, will be so distributed in different portions of the pipe that it will not easily be affected by the operations of the piston. Besides, it may be difficult, in a long pipe to prevent the occurrence of some small crevice, which will admit air into the water course, and thus defeat the object. But for small distances, such obstacles need not be apprehended; and the convenience of bringing water in pipes, by suction in a slanting direction to places where wanted, is very great in many cases. Nothing can be more convenient for house keepers, &c. than to have pumps in their kitchens, which will draw water from wells situated at a distance.

When the place in which the water is wished to be delivered is lower than the fountain, a siphon may be used, according to principles described in the New England Farmer, vol. v. page 345, and vol. vi. page 178.

With regard to the materials for aqueduct pipes or conductors of water, we would observe that whenever it is wished to draw water from some distance, by suction, the pipes must not only be water tight but air tight. Lead is perhaps most easily made air tight; and if the water is free from any mineral acid, may be the best material for water pipes. Sometimes, however, water, in its natural state, contains minute quantities of sulphuric or carbonic acids, which would corrode lead, hold it in suspension, or render it soluble in water, thus causing the fluid to become poisonous or at least unwholesome. Tin and cast iron are not liable to the same objections, but it might be difficult to make sheet iron pipes water tight. In common cases, we should give lead the preference for aqueduct pipes; but should be glad to be favored with the opinions of our friends and correspondents on this subject.

ON SWINE, BREEDS, ENGLISH, SPANISH, &c.

BY JOHN HARE POWELL, ESQ.

Fowleson, 1824.

DEAR SIR—No farm stock is so little regarded, yet there is none more important under particular circumstances than swine. As an appendage to a dairy, their value is generally understood—as the means of increasing and commixing the various items of which barn yard manure is composed, they have not been properly appreciated in this state. In New England where their management has been more skillfully conducted, and their profits as accurately ascertained, some of the most successful farmers, have devoted their attention, and the produce of their lands, almost exclusively to breeding, and fattening hogs. The delicate food, which they supply for the tables of the rich, the nutritious and frugal repast, which they afford to the industrious poor, would make them, & would be supposed, objects of sufficient

regard, to produce the sort of attention, which the dictates of interest alone would beget; yet we have scarcely found except on the estates of a few gentlemen in New England and New York, anything like an approach to the systematic, and regular course, which a profitable piggery, as much as a profitable dairy, requires.

There are many distinct breeds of swine, with peculiarities as determined, and properties as fixed, as those which characterize any race of domesticated quadrupeds known. In England, every county almost has a separate breed designated by its name, occasionally affected by the peculiar management of the breeder by whom it has been reared although in this country, in the common language of the farmers, we hear of the English Breed, as if it were a distinct race. The Bedfordshire, Berkshire, Suffolk, Sussex, Staffordshire, and Norfolk, are the families with which we are most familiar, and are perhaps best fitted for general use. To Mr PARSONS and Mr PRINCE, of Massachusetts, we are indebted for breeds of pigs which have been the basis of some of the best crosses we possess. Their varieties as well as the other, which I have enumerated, and most of the families which have been derived from them, do not afford flesh, with the fine grain, and delicate flavor, sought in our markets. Their carcasses have not sufficient proportion of muscle to fat. Some shades of difference have been effected by the introduction of Mr Colbette's breed, which uniting all the perfections of the best of the others in smallness of bone, early maturity and great disposition to become fat, possess other advantages, smallness of entrails, great fleshiness in the hams, and greater deficiency in the flavor of the meat.

To Commodores Chauncey and Stewart, we owe the introduction of some excellent families of Spanish hogs, which when crossed, with those of Mr Parsons's and Mr Prince's stock produce the variety I have seen. The late Mr Tomlinson possessed a large stock of swine which I had derived from individuals of the breeds I have named. The high prices, at which they were sold at public vendue, in some instances exceeding twenty dollars per head, evince the estimation in which they are held by the practical farmer, whose purchases were regulated by Mr. Tomlinson's sales of pork from the stall.

I am, &c.

JOHN HARE POWELL.

JONATHAN ROBERTS, ESQ.
President of the Pennsylvania Agricultural Society.

RATS.

Last year I had my smoke house so visited by rats, that they appeared to threaten destruction to all my bacon, and even damaged some of it after it was hung up and nearly smoked. I set a number of traps of several different sorts; and when I caught a rat, it appeared, as the old woman said of the flies, when she killed one, as if there came two or three to bury it. I had recourse to arsenic, but without much success; and I saw in your valuable work a publication of the cork experiment, I would not have had faith to try it, but that I had known it kill dogs. I then tried a composition of things which I knew the rats were fond of, and fed them on it two nights in succession; the next day I prepared the cork, and chopped it about the size of large duck shot. I then fired it in the same sort of materials as before, and the two first nights they preyed on it tolerably well; and the third night

not so much, and in about six days and nights they all disappeared. And what is very strange, we never found one dead. I am perfectly satisfied that not one fourth of those sagacious animals ever got a taste of the fried cork; but those that got troubled with it, must have alarmed and carried off the rest. Now you must know that this has been done more than ninety days, and I beg you to excuse my not telling you of it sooner; but the fact is, I was afraid that their absence was too good company to last, but I see no sign of any yet; therefore think the experiment worth trying through the United States, as they are troublesome boarders.—*American Farmer.*

From the American Farmer.

ON WASHING WOOL ON THE SHEEP'S BACK.

J. S. SKINNER, ESQ.—I observed in the American Farmer of the 16th inst. Mr Dickinson's account of the manner of washing wool on the sheep's back in Ohio.

The process described by him is the old method practised in New England by our forefathers, and is still the practice with many. But since the introduction of fine sheep, the people of this region have improved upon the old system. As the improvement is considered of importance, both in regard to saving of labor, and what is of more consequence, the better cleansing of the wool, I will give you some account of it.

We build a vat near some pond or stream, where the water can be let into it in sufficient quantity; a very small stream will answer. The vat 8 3/4 inches deep, 12 feet long and 4 feet wide, and elevated at the upper end 4 inches, and for convenience ought to be sunk into the ground one half its depth. On one side is the pen for the sheep before washing, the vat forming a part of the enclosure. On the other side a platform or walk of boards or plank is laid, connected to and level with the top of the vat, extending to the grass ground, on which one stands to tag and receive the sheep after washing. The water is let in at the upper end of the vat, by a trough made by nailing two strips of boards about six inches wide on to the side of a plank, say fifteen inches wide; the lower end of the trough is to be twenty inches higher than the surface of the vat. To perform the labor to advantage three hands are requisite; one to put the sheep into the vat, one to stand in the vat and wash, and one on the platform as before described. From eight to ten sheep are continually in the vat, and the one longest in is washed first.

Thus the wool has sufficient time to soak, so that when the animal is conducted by the man in the vat under the stream of water pouring from the trough, the dirt is immediately washed out.

Squeezing the wool when washing is considered bad policy and ought to be avoided, as it will prevent much of the dirt from escaping. Every part of the animal should be brought under the pouring stream, which opens the wool and washes it as clean as water can make it.

In this way one hundred and twenty sheep may be thoroughly washed in an hour; that is at the rate of two each minute; and the labour in putting in and taking out is very trifling, and the man in the vat is the only one exposed to be wet, and run much less than every person employed in the old way—and besides this, the wool

will be from six to ten per cent. cleaner, and as Mr Dickinson very justly remarks—"The farmer need not fear washing money out of his pocket into that of the manufacturer, as it adds greatly to the reputation of his wool to have the fleeces well washed." The place which we occupy is located beside a very small stream, and the whole expense of fixing it some six years since, was not over five or six dollars, and as many as fifteen or twenty farmers wash their sheep there. This is the season for washing sheep with us, and we farmers take some encouragement from the tariff bill recently passed by Congress. In regard to wool we think the duty high enough, but the manufacturer will doubtless need some further encouragement, which they will doubtless receive hereafter, as the principles of the American system forms one of the strong pillars necessary to the support of every free government.

Respectfully, yours,

SAM'L HURLBUT, Jr.

Winchester, Con. May 29, 1828.

COFFEE.

An interesting analysis of coffee was made by Mons. Cadet, apothecary in ordinary to the household of Napoleon, when Emperor; from which it appears, that the berries contain mucilage in abundance, much gallic acid, a resin, a concrete essential oil, some albumen, and a volatile aromatic principle, with a portion of lime, potash, charcoal, and iron. Roasting develops the soluble principles. Mocha coffee, is, of all kinds, the most aromatic and resinous. M. Cadet advises that coffee be neither roasted nor infused till the day it be drunk, and that the roasting be moderate. Dr. Moseley, in his learned and ingenious treatise, states that "the chemical analysis of coffee evinces that it possesses a great portion of mildly bitter, and lightly astringent gummy and resinous extract, a considerable quantity of oil, a fixed salt, and a volatile salt. These are its medicinal constituent principles. The intention of torrefaction is not only to make it deliver those principles, and make them soluble in water, but to give it a property it does not possess in the natural state of the berry. By the action of fire, its leguminous taste, and the aqueous part of its mucilage, are destroyed; its saline properties are created, and disengaged, and its oil is rendered empyreumatical. From thence arises the pungent smell, and exhilarating flavor not found in its natural state.

"The roasting of the berry to a proper degree, requires great nicety. If it be underdone, its virtues will not be imparted, and in use it will load and oppress the stomach; if it be overdone, it will yield a flat, burnt, and bitter taste; its virtues will be destroyed, and in use it will heat the body, and act as an astringent. The closer it is confined at the time of roasting, and till used, the better will its volatile pungency, flavor, and virtues, be preserved.

"The influence which coffee, judiciously prepared, imparts to the stomach, from its invigorating qualities, is strongly exemplified by the immediate effect produced on taking it when the stomach is overloaded with food, or nauseated with surfeit, or debilitated by intemperance, or languid from inanition.

"In vertigo, lethargy, catarrh, and all disorders of the head, from obstructions in the capillaries, long experience has proved it to be a powerful

medicine; and in certain cases of apoplexy, it has been found serviceable even when given in clysters, where it has not been convenient to convey its effect to the stomach. Mons. Machebranche restored a person from apoplexy by repeated clysters of coffee.

"Du Four relates an extraordinary instance of the effect of coffee in the gout; he says, Mons. Deverau was attacked with the gout at twenty-five years of age, and had it severely until he was upwards of fifty, with chalk stones in the joints of his hands and feet; he was recommended the use of coffee, which he adopted, and had no return of the gout.

"A small cup or two of coffee, immediately after dinner, promotes digestion.

"With a draught of water previously drunk, according to the eastern custom, coffee is serviceable to those who are of a costive habit."

"The generality of the English families make their coffee too weak, and use too much sugar, which often causes it to turn acid on the stomach. Almost every housekeeper has a peculiar method of making coffee; but it never can be excellent, unless it be made strong of the berry, any more than our English wines can be good, so long as we continue to form the principal of them on sugar and water.

Count Rumford says, "coffee may be too bitter—but it is impossible that it should ever be too fragrant. The very smell of it is reviving, and has often been found to be useful to sick persons, and to those who are afflicted with the head-ache. In short, every thing proves that the volatile, aromatic matter, whatever it may be, that gives flavor to coffee, is what is most valuable in it, and should be preserved with the greatest care, and that, in estimating the strength or richness of that beverage, its fragrance should be much more attended to, than either its bitterness or astringency. This aromatic substance which is supposed to be an oil, is extremely volatile, and escapes into the air with great facility, as is observed by its filling the room with its fragrance, if suffered to remain uncovered, and at the same time losing much of its flavor."—*Philip's History of Vegetables.*

LEAD MINE.

It is now about two years since a vein of lead ore was accidentally discovered on a barren tract of land in the town of Eaton, N. H. on the borders of this state, a few miles west of Saco River. A certain proportion of the mine was disposed of some time since to a gentleman of Boston, on condition that he should spend a specified sum in commencing operations, to ascertain the expediency of working the mine. A shaft of forty feet has since been sunk and a large quantity of ore extracted, the value of which has been tested and found to average about 75 per cent. in weight of pure lead. A barrel of it received here a few days since, weighed one thousand and four pounds; (the barrel was of the common size of those used for putting up pork.) This quantity was recently taken from the mine and is supposed to contain nearly 90 per cent. of lead. The proprietors have a fair prospect of finding the mine a profitable concern.

KNEADING MACHINE.

I have seen here (in Geneva) a kneading-machine, so simple and effectual, as to make it deserving notice. A deal box, two feet long, one

foot high, and one wide, turning on its long axle (it does not run through the box, but is screwed on each end) by means of a crank at the end, which a child may turn; one side opens on hinges, the inside is divided by means of one or two moveable partitions for different sorts of bread at one time. The lump of dough is thrown in, and the crank turned in the manner of a coffee-roaster. No hooks or bars or any thing inside; a hissing noise, occasioned by the carbonic gas escaping, indicates the working of the dough; and in about half an hour (less in warm weather) it is fit for the oven. The fault, if any, is that the bread is too much raised: I need not say that this is a much cleaner process of bread-making than the common one. This machine, neatly executed, with its stands, iron fastenings, &c., costs, at Lausanne, forty shillings sterling; one might be made any where, and, however coarsely, it would answer the same purpose.—*Simon's Switzerland.*

Medicine.—Professor Delpech of Montpellier, asserts that six thousand soldiers, afflicted with the itch, were cured in a few days "by washing their bodies twice a day first with soap and water, and afterwards with a solution of the sulphuret of potash (about four drachms of the sulphuret to a pint of distilled or fresh rose water.)" The Professor also states, that he has discovered, by comparative trials made in the hospital at Montpellier, that olive oil, rubbed over the skin, will as speedily cure those labouring under the disease, as the most powerful sulphurous preparations in common use. He says, that one hundred soldiers were entirely cured in an average period of seventeen days by this treatment.

Season of blossoms.—Our horticultural friends have been extremely polite in sending us some of the splendid products of their gardens. Yesterday, a lady of New-Jersey conferred the special honor of presenting a cluster of roses, comprising fourteen beautiful buds growing upon a single stem, the crimson petals just beginning to peep through their green envelopes. This morning Mr. Parmentier brought us, from his rural and tasteful retreat on Long Island, a most brilliant bouquet, composed of a great variety of roses and other flowers of gorgeous hues and delicious fragrance. Blessed be the hands that thus occasionally strew with flowers the editorial path which is too often beset with thorns!—*N. Y. Statesman.*

The Season.—The hay harvest was so abundant, the last season, that farmers generally predicted that the crop would be short, the present season. These predictions, we think, will not be fulfilled. The growth of grass is luxuriant, and, judging from present appearances, the first crop of hay will not be inferior to that of last year. Grain promises well. The growth of Indian corn is very slow, owing to the cold and wet weather. The deprivations of the crows have been more extensive than usual. The farmers say that these birds are much more bold and active in cloudy than in fair weather.—*Hamp. Gaz.*

An English gentleman now at Lockport, Niagara co. is engaged, when in his own country, in planting and cultivating American forest trees, such as the black walnut, sugar maple, white elm, &c. He is getting out plank, from trees of the largest size, to recommend his nursery.—*N. Y. Statesman.*

From the Lancaster Gazette.

TRANSPLANTING TREES.

Though the season for transplanting trees has elapsed, your paper of last week may become a source of injury, loss, and disappointment to some of your readers, when that season shall return. The extract from the New York American, if not very attentively read, will not correct, but confirm and strengthen the erroneous opinion, too prevalent among farmers, that when a tree is transplanted, not only its life, but its health and vigor may be preserved, with all its top, or head, what ever loss it sustains in its roots. Sir Henry Stuart, referred to in the extract, speaks of trees transplanted with *all* their roots retained. Being a gentleman of fortune, the expense of moving a valuable tree was not considered; the proper apparatus must be prepared, and the tree, with all its roots, must take the station his fancy points out. The roots being preserved, the top requires no diminution.

As trees ordinarily are transplanted in this vicinity, the price, the cost of moving them, is a primary concern. A tree is taken from the forest, it is brought to the destined spot, the ground prepared, and the tree is set, for one shilling, and the laborer makes high wages, and seeks employ in thus transplanting trees! What is the consequence? what is the labor? Having broken the ground at the tree with his hoe, the axe is sturdily applied—every root of considerable size is cut off within a foot or two of the body, while a few smaller ones are left to sustain and nourish the whole tree. Not infrequently, nine-tenths of the roots are left where the tree stood. Now I ask, can the remaining tenth part furnish a current of sap, sufficiently strong and active, to spread over the whole surface, which all the roots did but supply as nature required? Can this tenth part perform, not only its own part, but also that of the other nine? It cannot. Let the whole top remain, and in this case, there can be but feeble, very feeble foliage, and probably none. *The sap that rises will be dried up by the sun.*

Whatever theorists may allege to the contrary, my opinion is sustained by various indisputable facts. The vigorous healthy apple tree, from which the whole top is removed for the insertion of grafts, frequently dies of plectora. The food is prepared and brought forward for the nourishment of all the natural branches—there are no months to drink or receive it. Here and there a little scion revives and enjoys a very small quantity the remainder stagnates—the stock is drowned, turns black, and perishes. This I have often seen. Experience has convinced observing men, that when scions are set in a vigorous tree of considerable size, the farmer should be three years in removing the natural branches. This reasoning is strictly applicable to the transplanted tree. The roots which take a new station, should not be taxed above their means. If half the roots are cut off why oblige them to support more than half their branches? It appears to me rational to let roots and branches be proportioned, in the second position, as nature proportioned them in the first.

Having paid much attention to this interesting subject, I am satisfied there is little danger of removing too many branches from a tree transplanted, if deputation has been boldly made upon its roots. If it needs more receptacles for the sap furnished, it provides them without labor.

It is peculiarly gratifying to the observing traveller in this vicinity, to see the taste, the enterprise, liberality, and patriotism, which a few spirited and benevolent individuals have displayed, in lining so many of our streets and villages with double ranges of rich and well chosen forest trees. But little exertion is now necessary, to render each of our public roads a delightful promenade in a very few years. When in future, the weary traveller, after being scorched and broiled in an open road, on a sultry summer day, shall realize the refreshing air of a long, smooth, and shady street; he will bless the memory of that public benefactor, whose liberality provided such a prospect and such an innocent luxury, for public and private enjoyment.

From London's Encyclopedia.

THINNING CROPS.

The thinning of seedling crops, Marshall observes, "should be done in time, before the young plants have drawn one another up too much.—All plants grow stronger, and ripen their juices better, when the air circulates freely round them, and the sun is not prevented from an immediate influence: an attention to which should be paid from the first appearance of plants breaking ground. In thinning close crops, as onions, carrots, turnips, &c. be sure that they are not left too near, for instead of reaping a greater produce, there would be a loss. When they stand too close, they will make tall and large tops, but are prevented swelling in their roots; better to err on the wide side, for though there are fewer plants, they will be finer and better flavored."

Thinning the leaves of fruit-trees. "The leaves," Abercrombie observes, "have too essential an office as organs of growth to the entire plant, to be lightly parted with; and where the climate is not deficient in heat, compared with the habitat of the plant, or the portion of the year in which its season for vegetating falls, their shade is more likely to be serviceable than detrimental, even in the last stage of fruiting. Thus, cherries, raspberries, strawberries, currants, and other species whose full term of fructification is more than comprehended in our summer, reach perfect maturity, and acquire the color proper to each, though ever so much covered with leaves; whereas for those kinds which ripen with difficulty here, because the direct rays, and most intense reflection of the sun, is scarcely equal to the heat in the shade during the full summer of their native climate,—it is proper, when the fruit has nearly attained its full size, and is naturally losing its absolute greenness, to remove some of the leaves which shade it too much. Were the leaves thinned sooner, it would prejudice the growth of the fruit; and should they even now be swept off unsparingly, the growth of the year's shoots might be arrested.—The leaves which cover the fruit, whether peaches, grapes, late pears, or other exotics, must be removed gradually; that is, at two or three times in the course of five or six days; otherwise the unusual full heat of the sun darting upon the fruit, would occasion the rind to crack."

Neal says, "My practice has been, as the fruit begin to color, to pick off every leaf that may overhang them; thus very much enhancing their beauty and flavor. In late seasons, if the leaves of wall-trees hang longer than usual, they may be brushed off, in order to let in the sun and air the better to ripen the wood. This brushing, how-

ever, should be cautiously performed, never brushing much at a time. The leaves should not be forced off violently. Some use a common stable broom for this purpose; but a better instrument is a hazel, or strong willow with, or a small smooth cane. The shoots from which the leaves are to be displaced, should be gently stroked upwards, and outward; but never the reverse way, else there is danger of hurting the buds. Trees exposed to the wind seldom require this care; but sometimes espaliers may, and if so, the same course is to be pursued as above."

Thinning stone-fruits.—Thinning the over-abundantly set fruit on apricot, nectarine, peach and plum trees, is a necessary duty; as many of these, in good seasons, set more than they can nourish or bring near to perfection. This thinning, however, must be cautiously performed, and by degrees. If the trees have set their fruit very thick in particular parts only, such parts should be moderately thinned out now, and the other parts not yet. But if the fruit be very quickly set all over the tree, let it be generally thinned off to half its extent at this time; deferring the final thinning till the stoning be over; that is, till the shells be quite hard, and the kernel be formed.—For most trees, especially those anywise unhealthy, drop many of their fruit in the time of stoning; so that the thinning had better be performed at two or three different times; always observing to reserve the fullest, brownest, and best-formed fruit. Stone-fruits must be again looked over in June, and a few more fruit thinned off where too thick; and the final thinning must take place in July, when the stoning of stone-fruits is over, and previously to their beginning to swell off for ripening.—*Neal*.

IMPORTANCE OF ROTATION OF CROPS IN GARDEN GROUND.

Garden ground in general, being successively cropped with vegetables very near akin in nature to each other, and from the frequent application of manure, soon becomes a receptacle for worms, maggots, and other vermin, which prove destructive to the roots of carrots, onions, cauliflowers, and other tender vegetables, from which they are always free in new soils, or ground that has never been cropped before with such vegetables. The garden ground at *Errol* has been occupied as a garden for upwards of a century, and consequently is subject, in common with other old gardens, to the attacks of several species of vermin. This first induced me to try to remove this evil by a *rotation of cropping*; and the most rational method that presented itself was, to follow strawberries that had been four or five years planted, with onions; and artichokes that had stood the same time, with carrots; for the caterpillars do not choose to attack either the onion or carrot. This plan I found to succeed, and I have now practised it with uniform success for nine years.

Cauliflower and broccoli roots may be preserved from the effects of worms by watering the drills well with soap-suds before planting, and occasionally afterwards; this not only prevents the worm, but encourages the growth of the plants, and in some measure prepares the ground for other vegetables subject to the same sort of attack.—*Calcedonia Horticultural Society*.

The Secretary of the State of Pennsylvania has issued proposals for a five per cent. loan of two millions of dollars, for *Canal and Rail Road purposes*; the principal to be redeemable after 1852.

CULTURE OF SILK.

The following extract from the "Letter from the Secretary of the Treasury, &c. in relation to the growth and manufacture of silk," whilst it shows that, at an early period of our history, this valuable article was advantageously cultivated in the State of Virginia, excites our regret that so important a pursuit should have been abandoned. We hope to see it resumed, not only in Virginia but throughout the Union.—*Not. lat.*

History of Silk in the United States.—The culture of silk first commenced in Virginia. Upon the settlement of that colony it was deemed an object of the first importance; and the attention of the settlers was strongly directed to it by the British Government, by which silk-worm eggs, white mulberry trees, and printed instructions, were sent over and distributed. King James the First, in the 20th year of his reign, having doubtless seen the defeat of his plan to encourage the silk culture at home, was induced to attempt it in Virginia; and "having understood that the soil naturally yielded store of excellent mulberries," gave instructions to the Earl of Southampton to urge the cultivation of silk in the Colony, in preference to tobacco, "which brings with it many disorders and inconveniences." In obedience to the command, the Earl wrote an express letter on the subject to the Governor and Council, in which he desired them to compel the colonists to plant mulberry trees, and also vines. Accordingly, "as early as the year 1623, the Colonial Assembly directed the planting of mulberry trees; and, in 1636, another act was passed, in which the culture of silk is described as the most profitable commodity for the country; and a penalty of ten pounds of tobacco is imposed upon every planter who shall fail to plant, at least, ten mulberry trees for every hundred acres of land in his possession. In the same year a premium of 4000 pounds of tobacco* was given to a person as an inducement to remain in the country, and prosecute the trade in silk; and in the next year a premium of 10,000 pounds of tobacco was offered to any one who should export £200 worth of the raw material of silk." About the same time, 5000 pounds of the same article, was promised "to any one who should produce 2,000 pounds of raw silk in one year." The act of 1656, concerning the planting of the mulberry trees, was repealed in the year 1655, but was revived two years after; and the system of rewards and penalties was steadily pursued until the year 1666, when it was determined that all statutory provisions were thereafter unnecessary, as the success of divers persons in the growth of silk and other manufactures, "evidently demonstrated how beneficial the same would prove." Three years after, the legislative encouragements were revived; but subsequently to the year 1669, the interference of Government seems entirely to have ceased.—The renewal of the premiums after the act of the year 1653, was doubtless owing to the recommendation of Charles II.; for, in the year 1661, among the instructions given to Sir William Berkeley, upon his re-appointment as Governor, and while in England on a visit, the King recommended the cultivation of silk, and mentioned, as an inducement to the colonists to attend to his advice, "that he had formerly worn some of the silk of Virginia, which he found not inferior to that raised

in other countries. This remark is probably the ground of the tradition, mentioned by Beverly that the King had worn a robe of Virginia silk at his coronation.

The revived encouragement given by the Colonial Legislature to the culture of silk, had the desired effect. Mulberry trees were generally planted, and the rearing of silk worms formed a part of the regular business of many of the farmers. Major Walker, a member of the Legislature, produced satisfactory evidence of his having 70,000 trees growing in the year 1664, and claimed the premium. Other claims of a like tenor were presented the same session. The Eastern part of the State abounds at present with white mulberry trees, and it is to be hoped the People will see their interest in renewing the culture of silk.

HEMLOCK.

Very few of the countless varieties of plants whose blossoms wave by the way side, or flourish on the margin of the stream, are to be avoided, or can be regarded without admiration and pleasure. One, however, possessed most deleterious properties, and has been noted as a poison from antiquity. Its easy and certain power of destroying life, have recommended it for use in prisons of arbitrary rule, from the tribunal of the Athenian Areopagus, to the court of the Spanish Inquisition. Its mild and lethargic operation have established it not only as the instrument of the executioner, but the agent of the suicide. A species of this plant, emigrating from Europe, is now common about road sides, and in waste grounds; especially in those parts of the country which have been long settled. The frequent instances of deplorable accidents resulting from its use, show that its deleterious properties are unknown, or too often neglected. In general appearance the plant has a resemblance to the carrot when shooting up to bear seed. It is commonly found in bunches and rises to the height of four, five, or six feet, and produces clusters of minute flowers of a dull white, from June to November.

Dr. Bigelow speaks of the poisonous effects as very different on different individuals;—varying with the temperament of the person, the age and place of growth of the plant and other circumstances. Generally, dizziness, nausea, diminished power of vision, faintness and muscular weakness are described as the consequences of its operation. This plant is often eaten by children either from carelessness or ignorance. The papers on our table contain two instances, where death has followed the dangerous repast. While our legislature are proposing the destruction of the vegetable enemies of the harvest, it would be well if they would take measures to exterminate these treacherous weeds creeping round the habitations of man, to steal away life; and better still, if they were attacked by every person who discovers them intruding on the frontiers of his possessions. *Worcester, Egis.*

New Invention.—Mr Phin Welch of York, Livingston co, has invented and put into operation, a machine for making barrel staves which takes them from the log; and prepares them for the truss heap. It will with the attendance of a man and one boy, dress three thousand six hundred staves per day. A day's labor in the usual way is we understand, two hundred.—The value of this invention in a country where so many barrels are used, must be immense.—*Rochester Observer.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 20, 1828.

Extracts from Knight's Treatise on the Culture of the Apple and Pear.

The properties which constitute a good apple for cider, and for the dessert, are seldom found in the same fruit, though they are not incompatible with each other. The firmness of the pulp, which is essential in the eating apple is useless in the cider fruit, in the best kinds of which it is often tough, dry, and fibrous; and color which is justly disregarded in the former is generally indicative of the first good qualities in the latter. Some degree of astringency also, which is injurious to the eating fruit, as always advantageous of the other. Amongst the endless variety of kinds, which are found in Herefordshire, very few ever deserved the attention of the planter, and the greater part of those are only capable of attaining a proper state of maturity in very warm situations. When the rind and pulp are green, the cider will always be thin, weak, and colourless; and in whatever soil it may have grown, almost always possess color with either strength or richness.* The substances which constitute the strength and body in this liquor generally exist in the same proportion with the color, though there does not appear to be any necessary connexion between the tinging matter and the other component parts.

The apple being most easily propagated by grafting, the means of obtaining proper stocks must be amongst the first things to occupy the attention of the planter. A preference has generally and justly been given to those raised from the seeds of the native kind, or crab, as being more hardy and durable than those produced from the apple.

The offspring of some varieties of the crab, particularly of those introduced from Siberia, vegetate much earlier in the spring than other trees of the same species; and thence the inexperienced planter will probably be led to suppose, that such stocks would accelerate the vegetation of other varieties in the spring, and tend to produce an early maturity of fruit in autumn. In this, however, he will be disappointed. The office of the stock is in every sense of the word subservient; and it acts only in obedience to the impulse it receives from the branches; the only

* I have discovered since the last edition of this work was published, that the specific gravity of the juice of any apple recently expressed, indicates with very considerable accuracy the strength of the future cider.

† "The stock given client, but no motion to the grafts."—*Lord Bacon.* The keen and inquisitive mind of this extraordinary man appears to have penetrated deeply into the nature of vegetation; and in this as in other branches of knowledge, to have anticipated our discoveries of succeeding generations. He has suggested the idea of improving soils by combining the excellencies of different kinds, and exercises this to be practicable, though he says it cannot be done by grafting; because the graft "overrules" the stock. (NOTE.) To Lord Bacon, also belongs the remark that the lives of trees are greatly prolonged, when their branches are kept early taken off.

NOTE. But the nature of the fruit is to a certain extent, affected by the nature of the stock. Mr. Sars' observations, that crab stocks cause apples to be firmer, to keep longer, and to have a sharper flavor; and he equally correctly said, that if the breaking pears be grafted on quince stocks, the fruit is rendered gritty or stony, while the melting pears are much improved by such stocks. This, according to Will, is contrary to his considered as inconsistent with Lord Bacon's doctrine, "that the scion overrules the graft quite, the stock being passive only;" which, as a general proposition remains true; it being evident that the scion, bud, or marbled shoot is endowed with the power of drawing or forming from the stock that peculiar kind of

* In the early settlement of Virginia, tobacco was the circulating medium, the substitute for money, as sewing silk is, in goat at present, in Windham county, Connecticut

qualities, therefore, which are wanting to form a perfect stock, are vigor and hardness.

In collecting the seeds to sow, it must be remembered, that the habits as well as the diseases of plants are often hereditary, and attention should be paid to the state of the tree from which the seeds are taken; it should be large and of free growth, and rather in a growing state than one of maturity or decay. The crab trees which stand in cultivated grounds, generally grow more freely and attain a larger stature than those in the woods, and therefore appear to claim a preference.* The seeds should be taken from the fruit before it is ground for vinegar, and sown in beds of good mould an inch deep. From these the plants should be removed in the following autumn to the nursery, and planted in rows at three feet distance from each other, and eighteen inches from each plant. Being here properly protected from cattle and hares, they may remain till they become large enough to be planted out; the ground being regularly worked and kept free from weeds.

A difference of opinion appears always to have prevailed respecting the quality of the soil proper for a nursery; some have preferred a very poor, and others a very rich soil; and both perhaps are almost equally wrong. The advocates for a poor soil appear to me to have been misled by transferring the feelings of animals to plants; and inferring that a change from want to abundance must be agreeable and beneficial to both. But plants in a very poor soil become stunted and unhealthy, and do not readily acquire habits of vigorous growth when removed from it. In a soil which has been highly manured, the growth of young apple trees, generally indicates the utmost exuberance of health and vigor. These are, however, usually the forerunners of a disease, and the "canker's desolating tooth," blasts the hopes of the planter. I have seen many instances, in the black rich mould of an old garden, where young trees of the native crab could scarcely preserve their existence; and such mould appears almost equally fatal to the peach and nectarine trees. It has been justly remarked by Evelyn, that annual plants, having only a short time in which they are to fulfill the intentions of nature, readily accept any assistance from manure, and are rarely injured by the excess of it; but that trees, being formed for periods of long duration, are injured when attempts are made to accelerate their early growth by the stimulus of a large quantity of nutriment.

In choosing a situation for a nursery, too much shelter or exposure should be equally avoided;—and a soil nearly similar to that in which the trees are afterwards to grow should be selected if it can be obtained. Pasture ground or unmanured

nourishment which is adopted to its nature, and that the specific characters of the engrafted plant remain unchanged, although its qualities may be partially affected. The famous Baldwin apple is said not to be so fine a fruit as it has been, and its deterioration is attributed to the influence which the stocks have exercised over the scions by which it has been propagated.—*Editor of the N. E. Farmer.*

* I believe that this remark may be extended to every species of forest tree, and that the offspring of a stunted oak, the hardy tenant of a Welsh mountain; and of another tree of the same species, the more fortunate and gigantic inhabitant of the deep rich ham and mild climate of Herefordshire, would each retain a large portion of the acquired character of their parent, wherever planted.

† I have some good reasons to believe that an excess of highly nutritive and stimulating food is highly injurious to young animals, as well as to young trees, though it seems the fashion of the hour amongst medical men to think otherwise.

meadow, should be preferred to old tillage, and a loam of moderate strength, and of considerable depth, to all other soils.

AN INSECT WHICH ATTACKS PEAR TREES.

We have lately seen in the garden of S. P. GARDNER, Esq. of Summer-street, Boston, certain insects which were new to us, and of which we had never before seen nor heard of any description. They were small green worms, we should judge not more than three eighths of an inch in length, and a proportional diameter. They seemed to have emerged from the ground at and near the foot of several large and fine trees, and were attempting to ascend the trees. They were, however, prevented from accomplishing this object by a fortunate expedient of Mr. Gardner. By raising a small mound of earth about the trunk of the tree of three or four inches high, and its sides somewhat steep, a barrier was presented against the petty invaders, which they could not surmount. Many of them lay at the foot of the mound, apparently exhausted with their efforts to ascend it. Others in the act of climbing, would loose their foot hold, or balance, and fall back a part of the way, remaining in *statu quo*, apparently deliberating what further steps to take with regard to their ultimatum. They exhibited as much perseverance, but not so much success as Hannibal in crossing the Alps; and, probably, met with a defeat as fatal to them as was that of Jean d'Acree to Bonaparte.

It is not improbable that the means adopted by Mr. Gardner, (namely, raising a small steep mound of earth about the trunk of a tree) might be useful in defending against the canker worm, if begun in season, and properly persevered in. There were a few canker worms in company with the insects above mentioned, which were alike unable to pass the obstacle which a very small accumulation of earth presented. We should be glad to learn more of this insect, and to be informed whether it is a novelty, and nondescript, or an old, and to some people well known offender.

DISTEMPURED PEACH TREES.

Many peach trees in this vicinity appear to be laboring under a disorder of which we have seen, heard or read of no previous description. The leaves become fungous, bloated, dropsical, exuding a slimy or mucilaginous substance; in some instances, dropping from the boughs. The fruit has, (we believe) generally, remained in its place, though, in some cases, we are told it has already fallen, and in all cases, where the leaves are materially injured, the fruit must suffer more or less. We have examined some of these distempured leaves with a microscope, but have been able to detect no insects depredating on them. Probably the disorder may be termed a blight, originating in cold easterly winds, and damp weather; but we should be glad to obtain facts and opinions from our connoisseur-cultivators on this subject.

NEWS.

London advices have been received to May 14. By these it appears, that *Russia declared war against Turkey* on the 26th of April last. No authentic account of the actual invasion of Turkey has yet been received; but reports of such invasion have been and are on the wing.

Capt. Foster, a companion of Capt. Parry, in

one of his expeditions towards the north pole, sailed from England, with three vessels under his command, on a voyage of discovery in the southern hemisphere, with intentions of approximating the south pole as near as possible.

CANADA THISTLES.

The Fathers of our ancient Commonwealth, feeling the importance of showing their wisdom by enacting numerous laws for "the public good,"—have, at almost every season since our remembrance, employed a considerable part of their time in regulating the birds, fish, and reptiles within their jurisdiction. They must spend so much time at the metropolis, and what can be more useful, interesting, or profitable, than to legislate on these and similar subjects? But the fish, poliwag, and *Altitia* laws have been handled over so much, in years past, may have grown rather stale; and fears were entertained that the present session of the Legislature would terminate a week or two sooner than usual, for want of sufficient business to act upon. But "necessity," says the old proverb, "is the mother of invention;" and happily it has sprouted at the present time. By reference to our legislative journal, it will be seen that an Act has been brought on the carpet to prevent the spreading of Canada Thistles.—It is w^h object is to be effected we are unable to say, having never seen the bill which has been formed for that purpose;—it is presumed however, that it is not intended absolutely to forbid their growing, where no means are used to prevent it; and even if it should, ten to one the Thistles would not regard it; and in that case something must be done by the occupants of the land on which they establish themselves.—A cheap and effectual way of destroying them, root and branch, is to mow them when in full bloom, and scatter a small quantity of fine salt on the stumps.—The salt will penetrate through the pores to the roots, and utterly destroy all on which it falls.—This method has been tried in several instances within our knowledge, and we never knew it fail of entire success. As the Thistles can be destroyed in this way in half the time and for half the expense it would cost to do it by *law*, we hope those of our Agricultural friends who are troubled with these uncomfortable neighbors will at least make a trial of the above method to free themselves from their company.—*American Advocate.*

By our advertising columns, it will be seen that a Pamphlet has been issued from the Press, on Comparative Agriculture. It is from the pen of the Rev. Mr. Burton of Rawdon, and was one of the essays on that subject, offered to the "Society for the encouragement of the arts and sciences" at Quebec. It is well adapted for the instruction of the Canadian Farmer and Emigrant, as it points out in a very judicious manner the different systems pursued in Great Britain and Canada.—*Montreal Gazette.*

Grafting.—The Philogeorgic Society of Naples has offered a prize of twenty-five sequins to the author of the best paper on the following question: viz. "To establish, by facts, if the graft occasions any modification of the plant grafted; and *vice versa*, if the plant exercises any influence on the organization of the graft; with respect to plants and grafts of the same, or of different species and forms." The prize is to be adjudged in the year 1829.

SCOTT'S LEGACY.

John Scott, Chemist, late of Edinburgh, by his will, made in the year 1816, bequeathed the sum of \$4000 in the funded three per cent. stock of the United States, to the Corporation of the City of Philadelphia, to the intent, "that the interest and dividends to become receivable thereon, should be laid out in premiums to be distributed amongst ingenious men and women, who make useful inventions, but no such premium to exceed \$20:— and that therewith shall be given a copper medal with this inscription: 'TO THE MOST DESERVING.'" The Select and Common Councils, by an ordinance passed November 22d, 1821, intrusted "The Philadelphia Society for the promotion of Agriculture," with the distribution of the aforesaid premiums and medals, for the term of five years; and on the 25th January, 1827, they renewed the ordinance for a further period of seven years. Successive committees of the Society were appointed to attend to the business, by which the following premiums have been awarded:—

1822.—I. To Samuel Goodwin, for a Front Door Lock—\$20.

II. To Dr. James Ewing, for a Screw-cock Hydrant—a medal and \$20.

III. To Coleman Sellers, for a simple and effectual Cupping Instrument—a medal and \$20.

IV. To Thomas Barnitt, for a Press to force out the unnecessary quantity of tar absorbed by yarn, in the manufacture of cordage—a medal and \$20.

V. To Isaac Conard, of Lampeter township, Lancaster county, Pennsylvania, for a simple and effectual Barrow to plant Indian corn—a Medal and \$20.

VI. To George Harper, for two Drills, one for potatoes, and one for seeds—\$10.

VII. To William Shotwell, for an easy Garden Weeder—\$5.

VIII. To Robert Welford and James H. Deas, for an improved Plow with frictionless rollers, for plowing floors—a Medal and \$20.

IX. To Daniel Neill, for a Vertical Printing Press—a Medal and \$20.

X. To James Gardette, dentist, for three mechanical improvements in his profession; which are highly commended in Europe and the United States; and for a simple Lever instrument, for the easy and expeditious extraction of teeth, and stumps of teeth—a Medal and \$20.

XI. To Jonathan Nichols, of Providence, (R. I.) for the portable Carriage Spring Seat—a Medal and \$20.

XII. To John Meer, for a Razor Strop—a Medal and \$20.

XIII. To Mrs. Frances Jones, for an Improvement in the apparatus for making patent Lint—\$20.

1825.—XIV. To Benja. Freymuth, for a very ingenious Chamber Alarm Bell, which can be attached to a watch—a Medal and \$5.

XV. To John C. Jenckes, of Providence, (R. I.) for an Apparatus to enable persons with fractured limbs to be moved in their positions in bed, without injury—a Medal and \$20.

1827.—XVI. To Robert Eastman, of Brunswick, Maine, for an Improved Rotary Saw-machine, for sawing clap boards—a Medal and \$20.

XVII. To Joseph Woodhouse, of Otsego county, New York, for a Paper-cutting Machine—a Medal and \$20.

XVIII. To Abraham Corl, of Pugh town, Ches-

ter county, Pennsylvania, for a Drill for clock and watchmaker's work—a Medal and \$20.

XIX. To Joel Taylor, of Danbury, Connecticut, for an apparatus for dyeing hats—a Medal and \$20.

XX. To Daniel Powles, of Baltimore, for a bro-stead which can be put up and taken down by any person, owing to the peculiar construction of the joints, and is proof against insects.

XXI. To Daniel Powles, for a Stirrup, which effectually prevents the foot from sticking, in case a person is thrown from a horse—a Medal and \$20.

XXII. To James Cooper and Thomas Barnitt, for a Hat-finishing Apparatus—a Medal and \$20.

XXIII. To the Messrs. Terhoeven, brothers, of Philadelphia county, for an Apparatus which winds the silk from the cocoons, and twists and doubles it at one operation—a Medal and \$20.

All the inventions for which premiums have been awarded, are in actual use, and highly approved of. The Committee invariably require certificates of the originality and utility of the inventions, or improvements for which claims for premiums are made; and descriptions of them correctly written, and in clear language, accompanied by drawings in perspective, and in detail when necessary to illustrate them. Models of some of the foregoing machines are in possession of the Society, and the operation of most of them have been witnessed by the Committee. Where the invention is a composition of matter sufficient in quantity for the purpose of experiment, and to preserve in the cabinet of the Society, are required. To these rules of conduct, they, during the last year, added the following for the purpose of affording every possible chance of detecting any attempt at interference on the part of claimants, with the inventions of others. After having satisfied themselves of the utility of an invention, and resolved that it is worthy of a premium, they advertise that in three months it would be awarded, unless satisfactory testimony should in the mean time be brought forward to prove its want of originality. This regulation, which it is believed is altogether novel, it is the intention of the Committee to continue, as constituting the best guard in their power to adopt against deception.

The present Committee consists of James Mease, M. D. F. Pres. of the Phi. Agr. Socl. Robert Hare, M. D. Profes. of Chem. Univ. Penn. James Donaldson, Presid. of the Franklin Institute. S. W. Conard, Lecturer on Mineralogy and Botany. William Hembel, and William Phillips.

The Salem, (Mass.) Historical Society are making arrangements for celebrating their next annual meeting with greater ceremony than usual, on account of its being the 200th year since the landing of Governor Endicott at Naumkeag. Mr. Justice Story has been requested and has consented to deliver a discourse on the occasion. The landing was made on the 6th of September, 1627 and the celebration is to take place on the 18th of that month, this year, allowance being made for the change made from old to new style.

Cucumber Seed, &c.

Just received at the New England Farmer Seed Store, a further supply of Green and White Turkey, White Spined, Long Prickly, and small West India Girden Cucumber Seed—the latter is a fine sort for pickling, and should be planted soon.

Who understands the business, wants a situation. Good recommendations can be produced. Inquire at the New England Farmer office. 31 June 20

Barrefoat and Serab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Cullin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barrefoat, a chestnut horse, is as follows.

FOALD 1829.

Barrefoat, by Trump, dam Rosamont by Bozzard, out of Rosebery, sister to Huley and Tarrar, by Fluenon, out of Miss West by Matcham—Regulus—Crab—Childers—Basil.

In 1822, when at Pontefract, sweepstakes of 20 g. each, for two years old—11 subs.— Barrefoat beating Harpouner.

In 1823, York Springs St. Ledger, of 25 g. each, 6 subs.— Barrefoat beating four others—A. J. Pontefract sweepstakes of 30 guineas each for ten, 10 subscribers. Barrefoat beating Palatium.

In 1823, the Deaneater great St. Ledgers, of 25 g. each, 60 subscribers. Barrefoat beating 11 others.

In 1823, at New Market, Barrefoat won a handicap plate value £20, beating Tresselman and five others.

In 1824, at Astot Heath, Barrefoat walked over for the Swinlas stakes, of 25 sovereigns each 3 subs.

In 1825, at Lancaster, the gold cup, value 10 g. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages. Barrefoat beating Lottery and two others.

In 1825, at Manchester, Handicap stakes of 30 sovereigns each, 19 subs. with 30 sovereigns added—4 subscribers—Barrefoat beating two others. At Lancaster, the gold cup value 100 g. added to a sweepstakes of 10 sovereigns each 9 subs.—Barrefoat beating two others.

SERAB. (a valuable bay Horse.) FOALD IN 1824.

Got by Phantom out of Jesse, by Tottenham—her dam Cracker by Highley, out of Nutcracker, by Matsum.

In 1824, won the New Market stakes, 50 g. each, 21 subs.—Serab beating four others.

In 1825, at the New Market Crane meeting, the stakes, 100 sov'ns, 7 g. Serab beating two others. The same year, Spring meeting, Serab won Handicap sweepstakes, 100 sov'ns, 6 subs. beating three others.

In 1825, Serab won Kings Plate, 100 g. beating 30 others. In 1827, Sturton, Serab won the gold cup. 113

MISCELLANIES.

HINTS TO MEN OF BUSINESS.

Superintend in person as much of your business as practicable, and observe with a watchful eye, the management of what is necessarily committed to the agency of others.

Never lose sight of the powerful influence of example, and be careful in the management of your concerns, to recommend by your own personal practice uniform habits of active, interested and persevering diligence to those in your employ.

Be prompt and explicit in your instructions to your agents, and let it be understood by them that you expect they will execute the same in strict conformity thereto.

Let no common amusements interfere or mingle with your business; make them entirely distinct employments.

Dispatch at once, if possible, whatever you may take in hand; if interrupted by unavoidable interference, resume and finish it as soon as the obstruction is removed.

Beware of self-indulgence, no business can possibly thrive under the shade of its influence.

Do not assume to yourself more credit for what you do, than you are entitled to, rather be content with a little less; the public mind will always discover where merit is due.

Familiarize yourself with your books, keep them accurately, and frequently investigate and adjust their contents. This is an important item.

Cultivate domestic habits, for this your family if you have one, has a strong and undeniable claim; besides, your customers will always be best pleased when they find you at home, or at the place of your business.

Never let hurry or confusion distract your mind or dispossess you of self-command.

Under the influence of such habits as these, with a suitable dependance on Providence for a blessing on the labor of your hands, you will have a good foundation to rest your hope upon, for success in whatever business you may be employed in.

Md. Republican.

Those who think to obtain a excellence by imitation should never forget the remark of Lord Bacon, that—"Waters never rise higher than the fountain-head." Imitators may improve the method, but they do not contribute to intellectual proficiency; they may polish the form, but they make no addition to the matter.

"There never was a hypocrite so disguised but he had some mark or other to be known by."

One servant too many makes all the rest idle.

Flying.—A fellow has been gulling the cockneys, by giving out that he would fly over Westminster Hall, &c. after the manner of Telemus.—One of the crowd, waiting for this sight on Westminster Bridge, inquired of a neighbor, "pray who was Telemus?" to which the reply was, "the son of Diabolus;" I believe.—*London pd.*

Reputation.—The way, according to Socrates, to obtain a good reputation, is to endeavor to be what you desire to appear. "Men," observes Shakspeare also, "should be what they seem."

A pretty girl was lately complaining to a friend that she had a cold, and was sadly plagued in her lips by chaps. "Friend," said Obadiah, "these should never suffer the chaps to come upon thy lips."

Employment of Time.—The hours of a wise man are lengthened by his ideas, as those of a fool are by his passions. The time of the one is long, because he does not know what to do with it. So is that of the other, because he distinguishes every moment of it with useful or amusing thoughts—or, in other words, because the one is always wishing it away, and the other always enjoying it.

Addisa.

Mr. Johnson is exhibiting, at the Coffee house, a newly invented Settee, which is admirably adapted for the usual purposes of such an article of furniture; and by a very simple contrivance, it is made to deploy and form "a bed by night."—Whether used as a bedstead or settee, it is a highly ornamented piece of furniture—very light, and especially useful, we should suppose, on board of steam boats, and to be desired in almost any family. The changes are easily wrought, and when the bedstead is no longer required, nothing more than a highly finished chair back settee, with any desired decorations, is observable.—*U. S. Gaz.*

Craniology and political economy.—The pretensions of modern political economy as a science, may be well explained in the language of Blumenhach, applied to another modern science of a very similar character. When the celebrated professor was asked what was his opinion on craniology, he thus expressed himself:—

"There is much in it that is true, and much that is new; but that which is true is not new, and that which is new is not true."

Preserving crystals of salts.—M. Deuchar, in a communication to the Wernerian Society, mentions that crystals of efflorescent and deliquescent salts can be preserved from decay if the air in the jars in which they are kept is impregnated with oil of turpentine. This is effected by pouring a very small quantity of the oil over the bottom of the jar.

THE TIMES.

It is an undoubted fact that the times are getting better, and that in New York, money is beginning to circulate with more freedom. And the reasons are obvious. No great remittances to England are making for goods for the fall sales. The importation exceeds at present by many packages what it was up to the same period last year. The high premium for bills has begun to draw specie from the Spanish main, and even from Europe, into our ports. Produce maintains a healthy rate, and cotton is getting up to the prices of 1824. Stocks are rising daily as may be seen by the quotations. Now what is there to prevent a reaction to the late pressure? We predict that the banks will circulate their bills without fear of a drain. Real Estates will rise, and money will be plenty.—*Albany Paper.*

The extensive Horticultural and Flower Garden of Mr. Parmentier, a short distance beyond the Turnpike Gate, on the road leading to Jamaica, is now clothed in all its beauty. The foliage of the choice fruit trees and shrubbery which border and adorn this spacious garden, is now most perfect, and the great variety of splendid flowers, tastefully arranged, which present themselves to the eye, when viewed from his *Rustic*, afford a most pleasing and enchanting spectacle. The freshness and fragrance of the air is felt by all whom business or pleasure call that way.—*N. Y. Eccl. Post.*

MILLET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of superior quality; gentlemen in want of this article are requested to call and examine it. This is also a further supply of Orchard Grass, Lucerne, Fow Meadow, Bluegrass, Writral, Sugar Beet, Ruta Baga, Kussar Seed, Linna Beans, &c. with several new varieties of Turnip Seed from Europe, including the Yellow Malta, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh White Mustard Seed.—Also, Green Carion, Pine Apple, and Pomegranate Musk Melons; Carolina and Long Island Water Melons.

For sale at the New England Farmer Seed Store, a few pounds of Long White Summer Naples Radish, a variety highly esteemed in the Southern States.

Gunpowder, &c.

Da Pont's Gun Powder, at 23 to 50 cts. per pound.—Shot—Balls—Flint and Percussion Caps.
Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street—By E. COPELAND, Jr.
"Da Pont's Salt" as above, is warranted first quality—and is marked "E. Copland, jr. Boston," on the head of the cask. March 14.

Valuable Stock.

For sale, 7 Heifers, 2 and 3 years old, raised from some of the best Cows in this State, by Denton. Five of them have brought Calves this spring, and bid fair to make excellent milkers. They were selected by the professor the Yellow Malta, &c. stock, to be kept on his own farm, and are offered for sale in consequence of his having disposed of his farm. They are worthy the attention of any farmer who wishes to obtain good stock.

Also, 2 Horse Cals, 1 and 2 years old, by the imported horse Roman, from excellent mares, well known in this city. Apply to the publisher of the N. E. Farmer. June 6.

Bull Boivair.

The high bred imported Improved Short-horned Bull Boivair, will stand at the subscriber's stable in Charlestown, Mass. Price \$2 for each cow, or the season. This bull was selected by Mr. Coates, the keeper of the Herd Book, without limitation of cost, for the use of the Powchown stock and is so highly valued by Col. Powell, that he has always refused to sell him, and has consented to part from him but for a season, considering him in form, points, and pedigree, equal to any animal to be had in Great Britain.

Boivair is red and white, is not three years old, has his udder been forced; yet he gets immediately behind his fore legs 7 feet 3 inches. The singular neatness of his shoulder, the straightness of his back, the width of his loin, the smallness of his head, neck, and tail, the quickness of his gait together with the well known character of his family as dairy stock, render him one of the most desirable mares for improving our race of, that even in any country he found.

SAMUEL JACQUES, Jr.

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large quantity of Ornamental Flower Seeds, in papers of six and a quarter cents each; likewise done up in packages comprising 20 varieties, each sort being labelled, at \$1 per package.

Field Beans.

For sale at the New England Farmer Seed Store two barrels of small white prolific Field Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and are all of the growth of 1827.

This day published,

And for sale by S. G. Goodrich, No. 111, Washington-street.
THE LEGENDARY—Vol. I.
Consisting of Original pieces in prose and verse, principally illustrative of American history, scenery, and manners. Edited by N. P. Willis.

It is proposed to continue this work, and to publish a volume one in 3 or 4 months, if the encouragement is sufficient. The volumes will be sold separately—price \$1.25 per vol. j. 6.

For Sale.

A valuable real estate in Milton, pleasantly situated, 9 miles from Boston, on the turnpike road leading from Boston to Tappan, Bridgewater and New Bedford, containing about 30 acres of the variety of lands, and fruit suitable for a good farm, well watered, with good substantial and convenient buildings. Said farm is calculated to suit a gentleman of taste—or an enterprising young man for a milk establishment, being an excellent grass farm. The purchaser may leave with the buildings from 100 acres to the whole. Purchasers are requested to come and examine the soil and crop at this season; possession may be taken at any time from this to the first of April next. Conditions liberal. For further particulars inquire of the publisher of the N. E. Farmer.

Milton, June 10, 1825.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the date of subscription, are entitled to a discount of fifty cents.

AGRICULTURE.

Extracts from Knight's Treatise on the Culture of the Apple and Pear.

At whatever season grafts are intended to be inserted, the branches, which are to form them, should be taken from the parent stock during the winter, and not later than the end of the preceding year; for if the buds have begun to vegetate, in the smallest degree, and they begin with the increasing influence of the sun, the vigor of the shoots, during the first season, will be diminished; and the grafts will not succeed with equal certainty; though a graft of the apple tree very rarely fails, unless by accidental injury, or great want of skill in the operator. The amputated branches must be kept alive, till wanted, and having the end of each planted in the ground, a few inches deep in a shady situation.

The propriety of grafting near the ground, or at the height of six or seven feet, will depend on the kind of fruit to be propagated, whether it be quite new and just beginning to bear, or a middle aged variety. In new and luxuriant varieties, and these only should be propagated, it will be advantageous to grafts when the stocks are three years old; as the growth of such will be more rapid, smooth, and straight, than that of the crab—and there will be no danger of these being injured by beginning to bear too early. Not however, because they will bear less abundantly than others, but because they will support a heavy crop of fruit, and grow very considerably in the same season. I, nevertheless, formerly conceived it probable that grafts from middle aged varieties, having attained a more perfect state of maturity, would be most productive of fruit. The close analogy between vegetable and animal beings might, however, have induced me to infer, what subsequent experience has taught me, that the power and disposition in plants, as in animals, to produce the most numerous offspring, is greatest during their youth. It may nevertheless be a question whether the fruit of a newly raised variety of the apple will possess all the merits of the same fruit at its maturer age; and this is a question of no easy solution. The man who shall have marked the gradual change, during a sufficient number of years, will find himself no longer young, and an old man, the "laudator temporis acti," though his organs should remain unimpaired, will not readily admit that the fruit, which he remembers as a boy, has improved. In the decay of each variety, its merits appear to decline; for I feel too much deference for the opinions of our ancestors not to believe that the redstreak and golden pippin were once better cider apples than they are at present; and it also appears extremely probable that the fruit should be affected by the diseased and debilitated state of the tree. Middle aged kinds will be most successfully propagated by planting stocks of six or seven feet high, and letting them remain ungrafted till they become firmly rooted in the places in which the trees are to stand. One graft only should be inserted in each stock; for when more are used, they are apt to divide when loaded with fruit, and to cleave the stock, having no natural bond or connexion with

each other. When the stocks are too large for a single scion, I would recommend that grafts be inserted in the branches and not in the principal stem.

Could the future produce of young seedling trees be ascertained with accuracy at four or five years old, much advantage would arise from inserting buds in the annual shoots of stocks of the same age, at the height of six or seven feet; as the planter might then be in possession of a number of trees of any variety, just at the age when it arrived at the bearing state; and would be able to command a large number of grafts, as early as the merits of the fruit were known. No means by which the effects of time on the apple tree can be anticipated have yet occurred to me, and I despair of future success. In the common manner of growth in trees, the lateral buds are formed in one season, and expand into shoots in the next.— But if the point of a seedling tree, when it is a few weeks old, be pinched off, one or more of the uppermost lateral buds almost immediately vegetates; and if the point of the shoot this affords, be in the same manner taken off, the lateral buds again vegetate like the preceding; and the same process, with the aid of artificial heat, may be repeated seven or eight times in the first year.— When two lateral buds had shown a disposition to vegetate with nearly equal vigor, I in several instances, took off, in the year 1801, the shoot immediately above the second bud, and then inserted the amputated part, as a graft, within the bark of the annual shoot of a stock of four years old. Several grafts, thus inserted in June and July, succeeded perfectly well, and the leaf and general character of the shoots these produced, appeared sufficiently different from those of annual plants to encourage very sanguine hopes of success. But these hopes have been totally disappointed, and I have therefore nothing better than patience to recommend to the propagator of new fruits.

Though the quality of the fruit of a seedling tree cannot be ascertained whilst very young, I always insert a few grafts from every tree, whose appearance is very promising, because by having several trees of the variety, I can better ascertain its vigor and hardness, and at the same time am enabled to gain a more correct idea of the form and character the variety will take in its future growth, than can ever be obtained from a single plant. The trees thus grafted, will also attain nearly the same height and size as those which have been left in their natural state, and (should their fruit not be found valuable) will be just as proper as those to be grafted in the manner recommended with middle aged varieties. Care must, however, be taken to use the scions of such trees only, as are perfectly healthy and vigorous. An opinion was formerly entertained, and does not at present appear to be quite obsolete, that fruits might be improved by this process of double grafting; from the changes the sap was supposed to undergo in its passage through a stem belonging to different kinds of fruit. But I am inclined to think that no such changes take place, and that the leaf is the chief laboratory in which nature prepares the juices of plants, and in which these

acquire the power to generate and deposit the new matter that constitutes the annual increase of the tree. The width, and thickness of the leaf, generally indicates the size of the future apple, and the color of the black cherry, and purple grape, may be known by its autumnal tints, even in plants which have sprung from seed in the preceding spring. The tinging matter, in the leaves of these, is probably of the same kind as that to which the fruits will in future owe their colors. I have had some reason to believe that each variety of fruit requires its own peculiar leaf; for I have several times grafted the branches of young apple and pear trees close above some buds containing blossoms; and these, in four instances, produced fruit, which grew well, as long as I left any of their own leaves on the tree; but when I took those away, and none remained but those of the grafts, which were of other kinds, they withered and fell off. Whether their falling was occasioned by the want of proper nourishment, or by some other cause, is a question on which I am not prepared to decide. I am, however, disposed to attribute their falling to some other cause; for the vessels which carry nutriment to the fruit, do not appear to me to have any intimate connexion with those of the adjoining leaves, and I have some reason to believe that a fluid, of the same kind, is conveyed by similar vessels, into the fruit and leaf.

FINING CIDER.

When fining is wanted for good cider, isinglass is the best; it is composed of innumerable fibres, which being dispersed over the liquor, attach themselves to, and carry down its impurities. It should for this purpose, be reduced to small fragments by pounding in a mortar, and afterwards be steeped in a quantity of the cider to be fined, sufficient to produce its greatest degree of expansion—in this state it must be mixed with a few gallons more of the liquor, or be stirred till it is diffused and suspended in it;—it is then to be poured into the cask, and incorporated with the whole by continued agitation, for the space of two hours; one and a half, or two ounces, calculated at about five staples to the ounce, are sufficient for a hogshead of 110 gallons. The operation of isinglass is somewhat chymical as well as mechanical; it combines with, and carries down the tanning principle, hence, in the process of fining, the liquor loses a large portion of its astringency. Isinglass is more easily diffused through the liquor by being boiled; but by this it is dissolved, and its organization, on which its powers of fining depend, is totally destroyed. The excessive brightness it produces, is agreeable to the eye, but the liquor in my opinion, from repeated experiments, more especially in the cider from the Hewes' crab, always becomes more thin and acid by the operation.

Where isinglass cannot be had, the whites of eggs are an excellent substitute. Many nice managers among the opulent agriculturists of this and the neighboring States, use them for the table liquors bottled at home; by some accurate and scientific men they are preferred to isinglass, as less apt to produce hardness in the liquor. The

quantity required for a hoghead, are the shells and whites of three dozen eggs; the shells pounded in a mortar, and then stirred with the eggs in a few gallons of the liquor, to diffuse them well before they are poured into the cask, when the whole mass must be agitated for an hour or two, as is directed in the use of isinglass.

Whether isinglass or whites of eggs are used, I would recommend as a still better mode than the above, that the fining when diffused through a few gallons of liquor be poured into the empty cask, the liquor to be then racked off and poured on the fining—this mixes it well with the whole mass without the necessity of straining.

Mr. Joseph Cooper, of Gloucester county, New Jersey, recommends the jelly from cows feet as a good fining—that from one bullock, warmed and mixed with cider, he fined 2 hogheads; he strained it before mixing it—racked off the cider in ten days—he thought it improved the flavor of the liquor.—*Care on Fruit Trees.*

FOR THE NEW ENGLAND FARMER.

MR. FESSENDEN—The following articles were designed for the last number of the Massachusetts Agricultural Journal, but arrived too late for insertion.

That by Dr Harris was written in answer to a letter from me. It refers to two insects which attack the peach leaves. This letter will be read, I think, with great interest.

The letter from Mr Hardy relates to his practice of putting pomace about his apple trees, a practice which he disclosed to the Committee for deciding premiums for the best orchard.

JOHN LOWELL.

ON POMACE FOR APPLE TREES.

Waltham, June 6, 1828.

DEAR SIR—I am glad of an opportunity to communicate to the Sec. of the Mass. Society for Promoting Agriculture, my views in regard to the management of an Orchard, as, I have within a few weeks been verbally informed that many people in Norfolk are applying Pomace to their apple trees at this season; and, in my own neighborhood, I find that some persons have used all their pomace in this way, that is, by piling it up around their apple trees the last fall; likewise some persons from West Cambridge and Watertown, who have done the same, have expressed to me their doubts respecting its utility. I know not where they obtained their information relative to the management of an orchard, or the using of pomace, although I am told that something has been published, yet I have never seen anything respecting either, therefore I answer your request with the utmost pleasure, as it may be the means of saving some trees. I believe it is generally known that the seeds in pomace are a favorite food for rats, mice, squirrels, rabbits, &c. while they remain fresh and good, which they will do through the first winter. Now if pomace be put around trees in the fall to induce these creatures to come and hunt for the seeds in winter, my opinion is that the bark of the trees would be in great danger. I know of no necessity for putting anything around apple trees in fall or winter; it neither promotes their growth nor prevents their destruction that I know of.

The amount of all this I stated to the Committee while viewing my orchard, when Mr Welles asked why it might not be done in the fall. For

my own part I am astonished that every farmer, who has an orchard, has not discovered long ago that horned cattle should not be turned loose therein. Yet it has been a common inquiry ever since I was a boy, with every farmer with whom I have lived, where shall we put the pomace to keep it away from the cattle, forgetting it would seem that the orchard was the only place where cattle might not go, and that pomace put therein would do no hurt if it did no good. Some farmers, however, perceived this and carried the pomace into the orchard, without mistrusting that it would benefit the trees, it was in this way that I first discovered its beneficial effects on trees.—About eight years ago I thought of raising some apple trees; accordingly I planted out some pomace near where an apple and peach tree stood, there was an abundance of pomace, I chopped it over among the dirt and left it, I noticed for two years that the trees were more thrifty and the fruit larger than usual, and that weeds and grass did not grow as formerly, and that the earth was more moist, yet I paid little or no attention to it at the time, and might entirely have forgotten it, if it had not occurred to me from observations made afterwards, elsewhere, on perceiving trees to thrive extremely where pomace had been laid, from which circumstance I was induced to try the experiment; what the result will be I cannot tell at present.

This, however, I can say, for two years past I have applied all the pomace I made, to the most unthrifty trees in my new orchard, by carrying it from the mill in the fall, laying it far from any trees till spring, then in April or May I take from one to two bushels and put to each tree, in a snug pile around the tree. Then, in August, I spread it around two feet each way from the trunk, and chop it in with a hoe. Thus far the result has been, the trees have been much more thrifty, and in no instance have I found a borer to touch a tree where I applied the pomace.

Respectfully yours, &c.

N. HARDY.

BENJ. GUILD, Esq.

Sec. Mass. Soc. for Promoting Agriculture.

We publish the foregoing letter from Mr Hardy with great pleasure, as it affords information derived from a practical source. Mr Hardy was the successful candidate for our Society's premium of fifty dollars for the best orchard of apple trees. We think it important to add, that though present at the examination of his trees by a Committee of the Massachusetts Agricultural Society, we do not recollect to have heard the remarks which he made to Mr Welles on the subject of applying the pomace in the spring. We were, however, deeply impressed with his remarks on the use of pomace, and it did appear to us, highly reasonable, that that substance by the power of the acid contained in pomace, would not only more effectually check the growth of grass and weeds, than any application we had either used or heard of. We therefore in the fall of last year applied about a bushel of pomace to every apple and pear tree. The evil effects, conjectured by Mr Hardy did not follow. No mice attacked our trees, though there is great weight in his remarks on that subject. But if upon trial, it shall be found, that this evil does not follow, the fall would be the best period of application. We are constrained to say that we have little hopes that it

can have any effect on the borer, any more than a certain lady's application of scalding water can affect an insect securely lodged in the albumen of an apple tree.—EDITORS OF THE MASS. AGRIC. JOURNAL.

The article of Dr. Harris, unavoidably deferred till our next.

FOR THE NEW ENGLAND FARMER.

INSECTS DESTROYED.

MR. FESSENDEN.—If you think my mode of destroying the moth or miller, which produces the eggs from which the caterpillar is hatched, worth occupying a space in your valuable Farmer, you are at liberty to insert it.

From the readiness which most kinds of winged insects come to a light in warm dark nights, I was induced to try the experiment, I making a fire of light dry wood, in my orchard, during the time of the moth. The result exceeded my expectation. Since, I use a large iron kettle about three-fourths filled with earth; and on the make my fire, which may be moved in a hand cart, wheel-barrow, or even two men could easily carry it with a pole. The success depends much on two circumstances: 1st. The warmer the atmosphere, the more active the insects, and consequently more likely to fly into the flame. 2d. The darker the night the more perceptible the light, and of course the greater distance the moth will be attracted.

I am, sir, most respectfully,

Your obt. servant,

JACOB DEWITT.

Montreal, June 12, 1828.

To preserve melons and cucumber plants from bugs and flies.—Stick a few seeds, of very sweet squashes, around each hill, to be sacrificed to the vermin—the squash plants being so much sweeter than the cucumber and melons, that the flies will devour the squash, while the others will scarcely be touched; consequently, will get such a start as not to be injured.

CULTURE AND USES OF POTATOS.

At the weekly breakfast given by the President of the Royal Society on the 1st inst. Sir John Sinclair requested permission to lay before the meeting, a statement of the objects he had in view, in wishing that public attention should be more steadily directed than heretofore it had been, to the culture and use of potatoes; and having produced specimens of potato meal, and of the farina of potatoes; he proceeded shortly to explain how these two substances were prepared, and to what purpose they were respectively applicable.

POTATO MEAL.

In preparing potato meal, no material part of the root is lost. The whole, after being merely scraped or peeled, is cut into very thin slices, then carefully dried in any kiln or stove, and afterwards ground into meal in a common mill. The advantages of this process are—

1st. *Security for subsistence.* As potatoes are a very precarious crop, and cannot be preserved in their natural state, beyond a few months after they are dug, any country in which they form the chief sustenance of the people, must according to the present system, be extremely liable to scarcity. But when dried and converted into meal, potatoes may be preserved for a long period of time, and the abundant crop of one season may

thus be made to compensate for the scanty produce of another.

2d. *Increase of food from the same quantity of land.* Where a family depends entirely on their potato garden for food, such dependence necessarily leads to great waste. The potato is seldom ready for consumption before the month of October, and frequently becomes unfit for food before the month of June or July. The family, however, being obliged to live on their potatoes throughout the whole year, have no recourse but to consume one part of the crop, after it has lost much of its nutritious properties, and another part before it is thoroughly ripe. In this way, probably, one sixth of the whole crop is wasted. But as the potatoes may always be converted into meal, when in their greatest perfection, this waste may be prevented, and the same quantity of land will thus produce one-sixth part more of wholesome nourishment, at all times ready for consumption.

3d. *Prevention of diseases.* The unwholesome diet to which a population dependent wholly on potatoes is obliged to have recourse, during the months intervening between the decay of the old crop and the thorough ripening of the new, causes typhus and other diseases of a most infectious and fatal kind; but these diseases would in a great measure disappear, were the necessity for using the unwholesome food, which principally occasions them, no longer to exist.

The low rate at which potato meal can be supplied, when compared with other articles of human food derived from grain, appears, from the following result of the experiments by Gen. Disson, in Dumfriesshire, to ascertain their relative proportions:—

Wheat,	2½d.	} Per pound.
Oatmeal,	1½d.	
Barley Meal,	1¾d.	
Potato Meal,	1d.	

POTATO FARINA.

The mode of extracting farina from the potato, is, to separate by grating, straining, and repeated washing, the mealy from the coarse and fibrous part of the root. The former, which contains the most nourishing portion of the root, is then dried, and becomes exactly in appearance like wheated flour. The fibrous part may be employed for making household bread or other useful purposes. The advantages of this process are—

1. *Improvement in bread made from inferior wheat flour.* Flour produced from inferior soils, or exposed to unfavorable seasons, is deficient in that important article, "the gluten"—but by a mixture of the jelly of the potato, made from the farina, bread as light in texture, and nearly as nutritious in quality, may be produced, from flour of the finest quality, the gluten, in which inferior wheat is defective, being supplied by the farina.

2. *Greater quantity of nourishment from the same extent of soil.* An acre of land in potatoes will produce about 2,700 pounds weight of farina; whereas an acre of land in wheat will not produce more than 1350 pounds weight of flour. It is evident, therefore, that in proportion as farina is used instead of wheat in the composition of bread, the country will become capable of supporting a greater population, and be rendered more independent of foreign relations for subsistence.

Sir John proceeded to mention many other valuable uses to which potatoes may be applied, as the rearing and fattening domestic animals—the manufacture of spirits—the dressing of weaver's

webs—the preparation of various dyes, &c.; adding, however, that the points he had already dwelt upon were those which it seemed to him most important to illustrate.

AGRICULTURAL SOCIETY.

One Hundred Dollars Premium for the best Butter.

A number amongst the most respectable citizens of Boston and its vicinity having subscribed and paid over to *The Treasurer of the Massachusetts Society for Promoting Agriculture*, a sum of \$100 to encourage improvement in the quality of butter offered for sale in the Boston market, the Trustees of the Society, in compliance with the request of the contributors, will award this liberal premium of one hundred dollars, to the person who shall exhibit the best butter, not less than three hundred pounds weight, at the Society's Hall, in Brighton, on Tuesday, the 14th day of October next, (the day previous to the Cattle Show.) The competition will not be confined to persons within this Commonwealth, but will be open to the citizens of all the New-England States.

To entitle any parcel to the premium, it must have been manufactured between the first day of June inst. and the fifteenth day of September, of which fact a written declaration, under oath, will be required. The preference will be given to that parcel who has been longest made, provided it is of a quality not inferior to any other. The judgment of the Committee in making their award will be influenced by any appearance of particular attention to cleanliness and safety in the manner of putting up the Butter.

As a further encouragement to competitors, an opportunity will be afforded, on Wednesday, the day of the Cattle Show, to sell their Butter at public auction at Brighton, without expense of Auctioneer's fee; when the most liberal price may be expected for good butter;—it being a subject of general complaint that prime butter, except in small quantities, is rarely in Boston market, while it is well known that in other cities, and particularly Philadelphia, the market is daily and abundantly supplied with butter of the finest flavor, put up in the nicest manner.

The State premiums for the same article will be awarded as usual at the same time.

Application to enter for the premium of \$100 must be made to Jonathan Winship, Esq. residing at Brighton, on or before Monday the 13th of October.

RICHARD SULLIVAN. } Committee
GORHAM PARSONS. } Trustees.
E. H. DERBY.

June, 1828.

Printers of newspapers in the several New England States are requested to insert the above.

ALBANY.

The nursery grounds of Judge Buell, about 2 miles from the capitol, bids fair to become one of the most valuable and important establishments in this country, and one that will be of the most extensive benefit, particularly to the northern sections of the New England and middle states. It consists of about eighty acres of ground, a considerable portion of which is occupied as a nursery, embracing an immense variety of choice fruit and ornamental trees. The former have been inoculated or grafted with the greatest care and skill by himself and his partner, Mr. Wilson, from cuttings obtained from Europe, and particularly

from the London Horticultural Society, as being of the most superior kinds. The greatest attention is paid in preserving the exact names of every variety by careful diagrams of the garden, and labels, so that no errors can occur. Their culinary, ornamental and green house plants afford all the varieties which they are encouraged by the taste of the citizens to cultivate.

We were also much gratified, on a recent visit to Albany, with a number of other establishments of private gentlemen, who employ the advantages of leisure and fortune in the delightful recreation of gardening.

The collection of Mr. George Wilcox, though not of great extent, is unrivalled for the beauty and number of choice varieties of several select plants. His geraniums, in particular, of which he has nearly 200 kinds, are remarkably fine.—*N. Y. Farmer.*

Large Sheep.—Mr. John Brientnall, of Rahway N. Jersey, called at our office a few days since and exhibited some fine wool, of 20 inches in length, taken from an improved Dishley Buck, which he imported from England. The sheep now weighs 252 lbs. He will be exhibited at the Fulton market in his fleece, at the meeting of the New-York County Agricultural Society, on the 25th of June, and on the following day without his fleece. In our next number we will give a drawing of him, with some additional and interesting particulars.—*ibid.*

MANGEL WURTZEL.

It is stated in a late number of the British Farmer's Magazine, that at the late Doncaster Agricultural Meeting, Lord Althorp described an interesting experiment which he had made to ascertain the comparative merits of Swedish turnips and mangel-wurtzel in the fattening of cattle, the result of which went to prove the superiority of the latter. Two oxen were at the same time put to these different kinds of food, and continued at them for a stated period: that which was fed on mangel-wurtzel increased considerably more in weight than the other, which was fed on Swedish turnips; and the other, which had been at turnips, was put to mangel-wurtzel for a similar period; and it was found, at the termination of the experiment, that the ox which had been put from the mangel-wurtzel to turnips, had lost weight, while the other, which had been removed from turnips to mangel-wurtzel, had gained considerably. His lordship further observed, that during the droughty season, when the turnips had been nearly all burnt up or destroyed by the fly, the mangel-wurtzel had flourished, and was an abundant crop.—*American Farmer.*

The Baltimore and Ohio Rail Road will be commenced on the 4th of July. It is intended that the first spade full of earth shall be dug, and the first stone deposited, by the venerable Charles Carroll, Carrollton. The feelings of the Baltimoreans towards their distinguished fellow citizen, allow them to omit no opportunity of doing homage to his worth.

Green peas.—On Saturday morning, 17th of May, in Covent Garden Market, green peas were exposed for sale, for which the moderate price of three guineas per quart was asked!—There was also a show of cherries and strawberries, but the prices were equally high.—*Lon. pap.*

From Loudon's Encyclopedia.

WATER.

A copious supply of water is essential to a good kitchen-garden, and, from whatever source it is furnished, should be distributed either in reservoirs or open cisterns, or in pipes, properly protected, over the garden, and in hot-houses. If the supply is from a pond or river, a system of lead or cast-iron pipes may be adopted, and the delivery effected by cocks at proper distances; but if from wells or springs, the delivery should be open stone or cast-iron cisterns; or, in default of these, into tubs or butts sunk in the earth. In Tuscany, where the inhabitants excel in the manufacture of pottery, immense jars of earthenware are frequently adopted; in the Royal Garden at Paris, sunk barrels, and cisterns of masonry, lined with cement, are generally in the best gardens on the continent. In these gardens, a system of watering is adopted, which, though rendered more necessary there by the climate, than it can possibly be in this country, yet in various respects deserves imitation.

Many kitchen-crops are lost, or produced of very inferior quality for want of watering. Lettuces and cabbages are often hard and stringy; turnips and radishes do not swell, onions decay, cauliflowers die off, and, in general, in dry seasons, all the crucifera become stunted, or covered with insects, even in rich deep soils. Copious waterings in the evenings, during the dry seasons, would produce that fulness and succulence which we find in the vegetables produced in the Low Countries, and in the Marsh Gardens at Paris; and in this country at the beginning and latter end of the season.—The vegetables brought to the London market from the Neat's Houses, and other adjoining gardens, where the important article of watering is much more attended to than in private country-gardens, may be adduced as affording proofs of the advantage of the practice.

The watering the foliage of fruit and other trees to destroy or prevent the increase of insects, and of strawberries and other fruit-shrubs to swell the fruit, is also of importance; and though the climate of Scotland is less obnoxious to great droughts, than that of the southern counties, yet we find that excellent horticultural architect, John Hay, adopting a system of watering in various gardens lately formed by him in the neighborhood of Edinburgh.

The contrivance for watering or washing the foliage of the wall-trees in Dalmy garden, laid out by this artist, deserves particular notice. Water is supplied to the garden from a reservoir, situated on an eminence, a considerable height above the garden walls. Around the whole garden, 4 inches below the surface of the ground, a groove, between two and three inches deep, has been formed in the walls, to receive a three-quarter inch pipe for conducting the water. About fifty feet distant from each other are apertures through the wall, two feet and a half high, and ten inches wide, in which a cock is placed, so that on turning the handle to either side of the wall, the water issues from that side. The nozzles of the cocks have screws on each side, to which is attached at pleasure a leathern pipe, with a brass cock and director; roses, pierced with holes of different sizes, being fitted to the latter. By this contrivance, all the trees, both inside and outside the wall, can be most effectually watered and washed in a very

short space of time, and with very little trouble.—One man may go over the whole in two hours. At the same time the borders, and even a considerable part of the compartments, can be watered with the greatest ease when required. The convenience and utility of this contrivance must at once be perceived by every practical horticulturist. The same plan of introducing water is adopted in a garden which J. Hay planned and executed for Lord V. Duncan, at Lundie-house, near Dundee; and after the experience of several years, it has been greatly approved of. The water at Lundie is conveyed to the garden from a considerable height, and is thrown from the point of the dory with great force, and to a good distance.

Water in a garden is absolutely necessary, according to Justice; well-water is far from being proper, but that which is impregnated by the sun's rays is highly conducive to vegetation. He recommends forming a large pond or basin in the centre of the garden, which shall at the same time contain fish.

Gardens should be near a river or brook, that they may be well supplied with water. From these, Forsyth observes, "if the garden does not lie too high the water may be conducted to it by drains; or which is much better, by pipes, taking care to lay them low enough to receive the water in the driest season, which is the time when it will be most wanted. If there be no running water near the garden, and if the latter lies on a declivity near a public road, I would advise to make a hollow drain, or a cut, from the most convenient part of the road, to receive the water that washes the road in rainy weather, and convey it to a large cistern, or tank, in the upper part of the garden; this, if the road be mended with limestone or chalk, will prove an excellent manure. The water from the cistern, or from the river, may be conducted to the different compartments by means of pipes, which, having cocks at proper places, the water may be turned upon the different compartments of the garden at pleasure. Or the water may be conveyed in proper channels, and turned on the compartments in the same manner as in watering meadows. These pipes, channels, &c. will be a considerable expense at first; but they will soon repay it, by saving a great deal of time, which would otherwise be spent in pumping and carrying water. The most convenient time for turning the water on, is, in general, during the night; and in dry weather it would then be of the most essential service. If the situation be such that you are obliged to pump the water from deep wells, there should be a large reservoir, in which it should be exposed to the sun and air for some days before it is used; it may then be turned on as above. If the ground be wet and spewy, it will be proper to make a basin of the most convenient place to receive the water that comes from the drains, and to collect the rain that falls on the walks.

Water is the life and soul of a garden. Switzer observes, "it is one of the most essential conveniences of a country seat, and especially useful to kitchen-crops; for, indeed, what can be made of any ground without it? *Anima mea sicut terra sine aqua*, is a good metaphor to express it, as it really is the soul and life of all vegetation; and whoever does not make that one of his principal considerations, deserves blame or pity." Describing his design for the garden of Spy Park as to water,

the author observes, "the square basins are not only designed for little stews for fish, but at each corner there are clay and elm pipes, with plugs to them that go under the alley, and communicate themselves with the adjacent divisions or compartments, which will, in an instant, float the same, because the little basins are designed to lie six inches higher than those divisions or compartments; and the whole is so contrived by other larger elm pipes, that the said little basins are filled by the canal and other conveniences."

A source of water is considered essential to a garden by most writers. London and Wise, Evelyn, Hitt and Lawrence are warm in recommending it. M'Phail observes, that a garden to bring the produce of the soil to the greatest perfection, "should be well supplied with water, to water the plants in dry seasons." Marshall says, "if water can be introduced, and kept clean with verdant banks around it, it would be very useful where a garden is large; but let it be as near the centre as possible, being the most convenient situation. It should be fed from a spring, and (if it could) be made to drip in the reservoir, because its trickling noise is agreeable music in a garden to most ears." "If there be no natural stream that can be conducted through a garden," observes Nicol, "water should be conveyed from the nearest river, lake, or pond; soft water being most desirable for the use of the garden."

STARCH,

Or *Amylum*, is a preparation from wheat, obtained by steeping the flour of that grain in cold water, then straining it through a cloth, and suffering the farinaceous particles to subside. In many places, however, it is manufactured in the following manner:

Pure wheat is put into tubs of water, and exposed to the heat of the sun, to induce a proper degree of fermentation; the water being changed twice every day, for six or eight days, according to the warmth of the season. When properly softened and fermented, it is poured into canvass bags, which are worked or beaten on a board, placed over an empty vessel, in order to extract the mealy part. When such a vessel is filled with the liquid flour, a reddish fluid appears on the surface, which must be carefully skimmed, and pure water added; when the whole ought to be briskly agitated, and allowed to subside. As the sediment increases, the water is gradually drained, and at length the starch is formed into cakes, which are cut in small pieces, and dried for use.

Good starch, when dry, is pulverulent, tasteless, without odour, insoluble both in cold water and ardent spirit: on the addition of boiling water, however, it forms paste or pastry, of which the reader will find an account. It is one of the constituent parts in all mealy or farinaceous seeds, fruits, roots, &c. of plants; though some vegetables contain a much larger proportion of it than others. Thus, the Wake-Robin, and White Bryony, afford more starch than potatoes; and the Salep-roots, especially those of the Meadow-Orchis, for the greatest part, consist of that valuable substance.

Starch being the basis of hair-powder, and also of extensive utility for domestic purposes, various experiments have been instituted, with a view to ascertain such vegetables as might be advantageously substituted for wheat. But we shall only

notice the method adopted by Mrs. GIBBS, for preparing starch from the roots of the Wake-Robin; for which the Society for the encouragement of Arts, &c. in 1797, presented her with their gold medal. She observes, in her communication, that such roots are found in the Isle of Portland, in the common fields, whence they may be dug out, cleansed, and pounded in a stone mortar with water. The whole is then strained, and the starch settles at the bottom. A peck of these roots produced, upon an average, about four pounds of starch, which was sold at 11d. per pound. See also Wake Robin.

Starch abounds in a great variety of vegetables, Mr Parmentier has shown that the roots of 22 vegetables yield starch, and that the seeds of nine plants and trees contain it nearly pure. He omits, however, the *Arum Triflyllum*, or Indian turnip, which probably does not grow in France. See Turnip, Indian.

Dry mealy potatoes yield a large proportion of starch, which is preferable, when properly prepared, to the starch of wheat flour. The following is the method recommended by Baume.

Rasp clean washed potatoes, collect the pulp in a tub, and mix it with a great quantity of clean water. Place two wooden rails on the brim of another very clean tub to support a sieve; pour fresh quantities of water on the pulp, till the clear water runs through. In six hours the water will have deposited the flour suspended in it; when the water is to be poured off, and a great quantity of very clean water poured upon the flour remaining at the bottom of the tub, which is to be stirred up in the water, and the whole is to stand quiet till the day following. The flour will then be found to have settled at the bottom of the tub; the water is again to be poured off; the flour washed in a fresh quantity of pure water, and the mixture passed through a silk sieve pretty fine.—The whole must once more be suffered to stand quiet till the flour is settled; if the water above it is clean, the flour has been sufficiently washed; but if the water has any colour, it must be again washed.

When perfectly washed take out the flour, and place it upon wicker frames covered with paper, and dry it, properly defending it from dust.—When dried, pass it through silk sieves, to divide any clogged lumps that may remain; and steep it in glass vessels stopped with paper only.—*Domestic Encyclopedia.*

COAL.

The Hartford Review of Monday says, "We have on our table a piece of mineral coal taken from a vein recently discovered in the stone quarry at Rocky Hill, near this city. It was found in the trap rock, where it lies upon the red clay slate which underlies the whole of the hill, embedded in the spongy looking stone, with which our streets are Mac-Adamised in the upper part of the city.—It is of various sizes, from that of a pea, up to that of an egg. Upon examining the stones which are scattered in the streets, it may be found very abundantly interspersed in the fragments, having very much the appearance of shorl in granite.—The coal very much resembles the Anthracite, from Lehigh, having the same brilliant conchoidal fracture, and about the same specific gravity. Indeed upon comparing the specimen which we have, and a piece of Lehigh coal, we can hardly discover the least difference in their appearance, unless

it be, that the Rocky Hill coal is a shade darker than the Lehigh. We understand that the proprietor of the quarry intends blasting the rock, to trace the vein deeper."—*N. Y. Statesman.*

Lightning Rods.—The season (July) is near at hand, when your barns will be filled with the products of your fields. And it is certainly desirable after the labor and expense of filling them has been met, that they should be preserved to remunerate this labour and expense. You must however, be sensible, at least you will be, if you will recur to facts, that your expectations of reward for your toil are often cut short by a sudden stroke of lightning. This you can prevent by erecting lightning rods to your barns. The last season after the summer crops were gathered, a greater amount of property was destroyed by lightning, in the county of New Haven alone, than would have furnished lightning rods to every barn in the State. It must then certainly be unwise to risk such an amount of property, when it can be insured at so low a premium. After close observation for fifteen years, I fearlessly assert that during the months of July and August, that is, after your summer crops are lodged in your barns a greater number of barns are struck by lightning, by twenty to one, than any other objects of equal height and number. The reason is obvious to a careful observer, at least it is so to a philosophical one. The exhalations which arise from a barn filled with hay and grain, recently gathered, are great and form a column of rarefied air, which reach to a great height in the atmosphere. This column is a direct attractor and conductor of the electric fluid; as much so, as the smoke of an extinguished candle is to an approximating flame. Erect lightning rods to your barns, and the fluid is conducted harmlessly to the earth.

(It is a fact which we think none will deny, that barns that are stored with hay and grain, are much more frequently struck by lightning than any other building, let the cause be what it may).
Conn. Journal.

The horn snake.—This beautiful spotted reptile, is rarely to be found. One of extraordinary dimensions, upwards of five feet in length, and as thick as a man's arm, was killed on the 13th inst. at the Union Forge, (Woodstock, Va.) A gentleman who saw the animal, describes the horn, not as a blunt protuberance from the tail, but as a flint-hard substance encased in a shield, and as sharp as a needle, which when attacked, the creature shoots from the scabbard and inflicts a wound which would destroy any thing it encounters. Naturalists have universally described the weapon of this snake differently; we have not a correct account of it. The skin has been taken off, and no doubt Mr. Arthur, the proprietor of the works, will present it to one of the museums.

Butter in a week.—Mr. James Smith, of Whately, made from the milk given by one cow, in a week, 11½ pounds of butter, after using what milk was wanted in his family.

Mr. Powel, a celebrated agriculturist in Pennsylvania, will beat us all in New England. It is stated that he makes from a small cow upwards of 20 pounds of butter a week. The celebrated Oakes cow owned in Danvers, in this state, produced from 16 to 19 pounds of butter per week through the months of June and July; and in 8 months 484 pounds.—*Hamp. Gaz.*

HAY-MAKING.

The first thing to be considered about hay-making, is the time of cutting the grass. It should not be cut too early, or before it has got its growth, for this will cause it to shrink too much in drying. On the contrary, it should not stand too late, or till the seed be quite ripe. It is not only harder to cut, but the ripeness of the seed will cause it to shatter out while drying, which will be a considerable loss, as the seed is the most rich and nourishing part; and the soil will be the more exhausted by nourishing the seed till it come to maturity, and the next succeeding crop will be the poorer. There never can be any advantage in mowing late, unless it be thickening the grass roots, by scattering some of the seed, where they were before too thin. He that mows early has the advantage of longer days for drying his hay; and of shorter nights, when the dews are less detrimental to hay-making.

But the farmer who has many acres of the same kind of grass, cannot always expect to cut the whole of it in exactly the right season. That he may approach as near to right as possible, he should cut the thickest grass first of all; especially if it be in danger of lodging, or so thick that the lowest leaves perish, or the bottoms of the stalks turn yellow. The thinnest of his grass should be cut next, which is apt to be ripe soonest; and last of all, the middling sized grass, or that which is on a medium between thick and thin.

Where a second crop is expected the same year, thick grass should be cut a little earlier, that the roots may not be injured so much as to prevent their speedy recovery, by being closely covered too long by the first crop.

Some regard should be had to the weather, when the time of cutting is in contemplation.—Those, especially, should regard it, who are able to call in as much assistance as they please in hay-making.

Grass, which has not been washed by rain for several days, has a kind of gum on it, which is known by its adhering to the scythe. This gum is thought to be a benefit to the hay; and the farmers are fond of moving their grass when this gum appears, rather than just after the grass has been washed by rain.

As to the drying of hay, or the manner of making it, I know there are a variety of opinions. The right way is to do it in such a manner that as much of the sap as possible may be retained, and in the best state that is possible. In this I should think all would agree. All persons will allow that too much drying is hurtful. It is certainly a loss to rake it, or stir it at all, when it is so dry that the leaves will crumble. And doubtless as much of the sap should be retained as is consistent with its being kept in good order for fodder, and for long keeping.

Some grasses will keep well with less drying than is needful for others. The Rhode-Island bent, as it is called, or red-top grass, will do with less drying than some other grasses. It has been much practised to put up with so little drying that it heats in the mow to so great a degree, as to make it turn brown like tobacco; and it is known that cattle will eat it well, and thrive on it. But the mow will certainly send out part of the virtue of the hay in steams. I cannot but think that all grasses should be so much dried, that the mows and stacks, though they have a degree of heat, should not emit any sensible steam; and if

would not wish to have hay made brown by mowing. It surely does not appear to so good advantage at market.

Were it not for the labor and cost, a good way of hay-making would be, for the hay-makers to follow at the heels of the mowers, at least as soon as the dew is off, and spread the swarths evenly; turn the grass about the middle of the same day; make it up into cocks before night; open the hay, and turn it the next day; and so on till it be sufficiently dried, doubling the cocks if signs of rain appear. It will not commonly take more than two or three days to dry it, unless it be very green, or uncommonly thick and rank. A person who has but little hay to make, need not be much blamed, if he do it in this way; especially if the weather do not appear to be settled.

The practice of the best English, Flemish, and French farmers, is to expose the hay as little as possible to the sun. It is carried in dry, but it preserves its green colour; and you see hay two or three years old in their market, of so bright a green colour, that we should scarcely conceive it to be cured. Yet they are in the practice of preserving it for years, and value it more for its age. If such a course be best in climates so cool and cloudy, how much more important would it be under our scorching summer suns?

But if the weather be unsettled, or if showers be frequent, it may be better to spread grass well, as soon as it is mowed, stir it often, cock it the same day it is mowed, open it in the next fair day when the dew is off, let it sweat a little in cock, and house it as soon as it is dry enough. It will bear to be laid greener on a scaffold, than in a ground mow; and in a narrow mow greener than in a broad one. And that which is at least of all made, should be put upon a scaffold.—*Deane.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 27, 1828.

FOR THE NEW ENGLAND FARMER.

DISTEMPERED PEACH TREES.

MR. FESSEYDEN.—Your last paper takes notice of the desolated appearance of the peach tree, with their leaves curled and discolored; and all cultivators and lovers of fruit will agree in a desire that the cause of this disorder should be sufficiently understood, as the first and indispensable step to find out a prevention, or a cure.

This disorder is named by the French horticulturists *cloque*, and is deemed to be one of the worst ills to which this delicate and precious tree is exposed. The *Maison Rustique*, an agricultural publication of ancient days, gives a considerable and curious dissertation upon the subject, fixing the cause upon pestilential winds, blights, &c. observing at the same time that after the curled leaves have fallen, they appear full of small lice; and on that account insists on the necessity of gathering and burning them, to destroy the seeds of the disorder for succeeding seasons. In years long passed and gone, I have seen the *cloque* in Switzerland, and invariably were the leaves stowed underneath with an infinite number of lice, and they were universally accounted as the cause of the disorder. Here with the best observation I could make with a microscope of small power, no lice were apparent; but this does not satisfy me that there were none. The distempered leaves are now falling off, and many on the outside exhibit

the existence of a light green mildew, much similar in appearance, and musty smell, to that, which attacks late crops of peas. I am strongly impressed that the curled leaves of the peach trees are brought into that situation by insect aggression, or by being converted by the circumstances of the season, into a soil for parasitical plants, such as are vulgarly called mildew, to fasten on and grow, perhaps both causes unite to the result; for my part, until I am better informed, I would not hesitate to apply to this case the recommendation given to us, before, from able horticulturists in regard to pear trees, viz. to hasten to burn the disordered parts; I would, without delay, collect the fallen leaves, and consign them to the fire. With us the *cloque* is a less serious malady for the peach tree than in Europe, the energy of the soil and climate, I suppose, assists the trees better to recover; new leaves are now coming on, and it is probable that in the course of July the trees will be again clothed in verdure and beauty, and leave only some few small branches which were sickly before, to pay the forfeit and die; they will come on for the August pruning, which is esteemed the safest and best time to trim peach trees. This little ailment will clear the trees, the quicker, of some of the young fruit, which hangs too full, so that the exhaustion occasioned by putting forth new leaves, will be partly redeemed by the quicker fall of the exuberant young fruit. About this town, so far as I have noticed, there will be enough left, and I do not remember ever to have seen the fruit so early a part of the season, of a better size and appearance. The season has been uncommonly wet and chilly, and favoring the development, and growth of parasitical plants. I have now peas which are mildewed, and in gathering asparagus, I noticed one with a growth, on its stem, of plants of that genus, altogether new to my observation, and which on that account, I send you herewith, thinking it may be, perhaps a curiosity. The peach trees, I have situated on rich ground, and rather moist, have suffered most from the *cloque*, and have hardly any leaves at present, and little or no fruit. Those on common dry, thin loam, the customary soil with us for the peach, are in tolerable order, as you will see by the little branch, No. 1, sent herewith—but you will observe on it one peach marked with the seal of the season, viz. one spot of mildew. My peach and nectarine trees, situated on a *dry gravelly knoll*, are in good order, have very few curled leaves, and are full of fine fruit, as you will see by the branches, No. 2 and No. 3—yet the knoll is fully exposed to the east and north winds;—to which from generation to generation blights and mildews have been attributed: this has confirmed me in the impression I had before, that gravel under certain management, will give the most constant crops of nectarines and peaches, of a middling size and best flavor, trees of the longest life and subject to fewer disorders. I am, sir, with much esteem, yours, &c. J. M. G.

Weston, June 23, 1828.

The able writer of the above, will please to accept of our thanks for his lucid exposition of the cause and effects of the distemper in peach trees, which has alarmed our horticulturists. The specimens of diseased branches, together with the asparagus plant, to which is attached a new kind of fungus, may be seen at the office of the New England Farmer.

INSECTS DESTROYED.

We are informed that a cultivator in Medway, Mass. has succeeded in destroying the bugs which prey on cucumber and melon vines, by means of fires, lighted in the night. He split the staves of old tar barrels, or those of barrels in which resin or turpentine had been kept, stuck one end of the slits in the soil of his garden and set fire to the other end, thus forming cheap torches which burnt during the night. The bugs would fly into the blaze thus produced, and immolate themselves with as much zeal as so many Hindoo widows. This plan of destroying bugs and other insects has been recommended and practised by Dr Harris, Mr Preston and others, but the combustible material above mentioned, has not, so far as we have learnt, been before applied to alluring insects to self destruction.

Our informant likewise gives us another mode of preserving vines, &c. from insects, which is equally effective:—Put a piece of quick lime, about the size of a hen's egg, into two quarts of water, add two ounces of sulphur, and boil the composition gently about two hours. Apply this mixture to the vegetables you wish to preserve, by means of a watering pot, or otherwise, and it will destroy such insects as it comes in contact with, and protect the plants from subsequent attacks of similar destroyers. He says a composition of this kind, although it may be so caustic as to separate the skin from the flesh of one's hand, will not injure plants.

FIRST FRUITS OF THE SEASON.

The Rev. Mr. CAPEN, of South Boston, has favored us with a fine sample of potatoes, of this year's growth, which are of a good size, and have the appearance of being nearly or quite ripe.

MR. N. ADAMS, of Charlestown, has presented us with a parcel of strawberries, which may be ranked among the notables of a fruitful soil and season; affording very fragrant evidence of careful, judicious, and scientific horticulture. They are of the variety called the Hautbois Strawberry; of a fine flavor, and on an average, little if any short of three inches in circumference.

Our friends will accept our most grateful acknowledgments for having thus rewarded our labors of the closet with the fruits of the field; and thus enabling us to say that as our toils are unintermitted they are not unproductive.

Tuesday, June 24.

THE SEASON.

From all quarters of the United States we receive the glad tidings of great abundance in possession and in prospect. The hay harvest has commenced, and the quantity of grass, great beyond all precedent;—considerably surpassing what has been gathered in those years when that product has been most exuberant. With respect to grain, fruit, roots, garden vegetables, &c. we can only say that appearances are promising; and we have reason to hope that the progress and termination of the season will be in happy accordance with its commencement. Some partial evils, such as ravages of canker worms, blight of peach trees, superabundant moisture in low lands, &c. are much more than counterbalanced by the general plenty which pervades every part of the Union.

Salt.—A company with a handsome capital has been formed at Saratoga, for excavating the ground in order to obtain salt.

From the Boston Centinel.

The culture of silk is one of the easiest of domestic productions. A few mornings since, on visiting an extensive nursery of the silk worm in this vicinity, we were satisfied that the attention of a single person of almost any age or either sex, is sufficient for the care of some thousands of them. The eggs in this nursery were received from Connecticut, but the young hatched animals feasted with avidity on the leaves plucked from an adjacent mulberry tree.

A friend who accompanied us in the visit mentioned, remarked that he had recently purchased, for a daughter, a farm in Windham, (Conn.) of which five acres were planted with mulberry trees, for the sole purpose of raising food for silk worms. He added, that the trees on an acre would furnish food for worms which would produce annually, five hundred pounds of raw silk—and that the raw and sewing silk, raised in Connecticut as early as 1810, was worth nearly 20,000 dollars, all raised by females.

Our estimable fellow citizen, Mr. Gourgass, of Weston, who we will know spares neither pains nor expense to promote the best interests of his adopted country, has imported some beautiful specimens of *raw silk* of all qualities, shades, and colors; and will, we are informed, exhibit them at the approaching Show at Brighton, for the gratification of all who may wish to view them.

The above is a part of an article in the last Centinel, too long for entire insertion in our paper of this week. The beautiful specimens of silk above alluded to, imported by Mr. Gourgass, may now be seen at the office of the N. E. Farmer, 52 North Market-street.

Management of bees.—It is the common practice to place the hives where the sun has the greatest influence; such as beneath a south wall; and to let them remain in the same situation during the winter. For the summer this is all right; but as the winter approaches, the hives should be placed where the sun never appears. It is not so much the degree of cold that injures the bees as the variations. Under a south wall the sun is sometimes powerful, even in the depth of winter; thus the bees are roused into action, and are ill prepared to meet the extreme cold of the night. Besides, when laying in a torpid state, which they do during the coldest weather, the bees do not require so much food; and I am led to believe that the cold is not so excessive during the night when the sun has not shone during the day; but even allowing the reverse, still I think as the degrees of cold are less variable, the north side of a house or wall is the preferable situation during the winter. Nor should the bees be removed into the sun until the trees have so far shot forth their buds that they may find a sufficient repast. I think these hints may be useful to those who would wish to become practical apiarists. My knowledge of the matter is theoretical; but I have friends who follow the practice.—*Lon. Mec. Magazine.*

Indians.—We have been credibly informed that the Indians between Chicago and the country occupied by the Winnebagoes, chiefly Pottawattamies, have planted no corn this year; and that the traders and those most acquainted with their

habits and policy, believe that this fact indicates hostile intentions. It is said that they never take the trouble to plant corn, when they believe that they will not be permitted to gather it in peace; or when they think they will be too busily engaged in more important concerns at the gathering season. Other Indians, in the vicinity of Chicago, it is said, have not planted.—*Detroit Gaz.*

The following extract of a letter from Darien, Geo. dated 26th ult. mentions the important fact that the sugar cane endured the frost in April without injury, while the other plants were destroyed.

“We had a severe frost in April, which killed all the cotton, corn, and a great deal of the rice, through the state—but it was in time to re-plant, and the crops of all kinds look uncommonly promising, both in the upper and lower country. The cane escaped uninjured, which proves that it is a most valuable plant. Its culture is extending in this vicinity, and it will be attempted in South Carolina, and largely in Florida.

“We are informed,” says the Connecticut Journal, “that Dolland, of London, one of the most distinguished artists of the age, is constructing an Achromatic Telescope for Yale College, of such size and power, as will render it no small acquisition to the scientific apparatus of the Institution. It has a focal distance of ten feet, and an aperture of five inches, and, as appears from a description already forwarded by the artist, it will afford a commanding and magnificent view of the planets.”

The Harvest.—The Winchester Virginian of the 6th, states that “the approaching harvest promises to be one of the most abundant that has crowned the labors of the husbandmen for many years.” The last Petersburg “Old Dominion” says “the wheat, except that portion of it in this section of the country lately inundated by the great fall of rain which we noticed a few days ago, never looked better, and promises the planters a harvest indeed.”

CARD.

As Mons. A. Parmentier, proprietor of the Horticultural Garden near New York City, has engaged to visit this City, July 7, for the purpose of laying out gardens and Pleasure grounds, any gentlemen wishing his services, will please apply prior to that time, to J. R. Newell's Agricultural Warehouse, No. 52 North Market Street.

N. B. As Mr. Parmentier is celebrated for his taste in the above science, and his charges are very low, we wish him success.

For Sale.

At the Agricultural Warehouse 100 Doz. of Derby's patent Scythe Rides—Posemore, Dudley, Foster, Farwell and other best warranted Scythes—Mcgregory and Hall's best warranted hay rakes—Willis's Improved Horse Power Machine—Pope's Hand Threshing Machine, &c.

Cucumber Seed, &c.

Just received at the New England Farmer Seed Store, a further supply of Green and White Turkey, White Spined, Long Prickly, and small West India Girkin Cucumber Seed—the latter is a fine sort for pickling, and should be planted soon.

A Gardener

Who understands the business, wants a situation. Good recommendations can be produced. Inquire at the New England Farmer office. 3t June 20

At the New England Farmer Seed Store, “A Memoir of the Cultivation of the Vine in America—and the best Mode of making Wine. Second edition. By John Adlam. June 27

Barefoot and Scrub.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barefoot, a chestnut horse, is as follows.

FOALING 1820.

Barefoot, by Trump, dam Resound by Buzzard, out of Roseberry, sister to Huley and Tartar, by Phenomenon, out of Miss West by Matcham—Regulus—Crab—Chalders—Bastid.

In 1822, when at Pontefract, sweepstakes of 20 gs. each, for two years old—11 subs.—Barefoot beating Harpourt.

In 1823, York Springs St. Ledger, of 25 gs. each, 6 subs.—Barefoot beating four others.—A. Pontefract sweepstakes of 30 guineas each ten feet, 10 subscribers. Barefoot beating Pala-tine.

In 1823, the Doncaster Great St. Ledgers, of 25 gs. each, 80 subscribers. Barefoot beating H. Rodgers.

In 1823, at New Market, Barefoot won a handicap plate value £50, beating Tresslum and five others.

In 1824, at Ascot Heath, Barefoot walked over for the Swin-las stakes, of 25 sovereigns each 3 subs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 subs. of all ages. Barefoot beating Lottery and two others.

In 1825, at Manchester, Handicap stakes of 30 sovereigns each, 10 ft. with 20 sovereigns added—6 subscribers.—Barefoot beating two others. At Lancaster, the gold cup, value 100 gs. added to a sweepstakes of 10 sovereigns each, 9 subs.—Barefoot beating two others.

—SERAB, (a beautiful bay Horse.) FOALING IN 1821. Got by Phantom out of Jesse, by Tottenham—her dam Cracker by Highflyer, out of Nutcracker, by Maresman.

In 1824, won the New Market stakes, 50 gs. each 21 subs.—Serab beating four others.

In 1824, at the New Market Crane meeting, the stakes, 100 sovereigns, 7 subs. Serab beating two others. The same year, Spring meeting, Serab won Handicap sweepstakes, 100 sov. us 6 subs, beating three others.

In 1826, Serab won Kings Plate, 100 gs. beating 30 others.

In 1827, Stratton, Serab won the gold cup. 14 3

MISCELLANEOUS.

From the Boston Statesman.

THE WEATHER.

As far in June—the 6th of June—
The month of leaves and roses—
And pleasant light should meet the eyes,
And pleasant smells the noses;
They say that time is on the wing
And on the Autumn gaining,
But who would know it when it is
Perpetually raining.

I got my summer pantaloons
A month ago o'Monday,
And I have never had a chance
To sport 'em even one day.
It's time for all the pleasant things,
For walking, riding, training,
But there is nothing in the world
But raining, raining, raining.

'Tis there's Jane has staid at home until
She's white as an alabino,
And simple Sue is in a fret
To wear her Navarrio;
"The wash" is soaking in the tub,
The cambric muslins staining,
And human nature's in the dumps
With raining, raining, raining.

The weathercock has rusted East,
The blue sky is forgotten,
The earth's a saturated sponge,
And vegetation's rotten.
I hate to see the "darkest side,"
I hate to be complaining,
But hang me if my temper stands
This raining, raining, raining.

The hardest grapple on earth is that which obtains between *pride* and *poverty*; and the man who has become the disputed province of these two *belligerents*, is a stranger to repose and happiness.

Flower.—The flower Kurbut, which is found in the East Indies, measures three feet across, weighs 15 pounds, and the nectarium, or that part which contains honey, holds 6 quarts. Only think of a flower larger than a two bushel basket!

A revolutionary soldier the other day told us, that the present king of England had saved this country millions of dollars! Not knowing that economy was a very prominent trait in his character, we inquired how he did it? Our informant replied, that "when the present king was about sixteen, he went to a jeweller and ordered a pair of elegant *shoe buckles*, intending to wear them at an approaching levee. The credit of the prince had been so much reduced by his extravagant habits that the jeweller refused to trust him.—The prince, in a rage, told the jeweller he should 'spoil his trade,' and with this threat left him. At the next levee the prince appeared, having neatly tied his shoes with a plain black ribbon. The fashion thus set by the heir to the throne was followed by all classes; and buckles, which were before universally worn, both in England and America, were entirely thrown aside, and buckle-makers were obliged to learn other trades."

A man was lately tried in England for selling *poisoned liquors*, knowing the fact. A physician stated that he attended upon the deceased, in the last stages of his sickness, and that he exhibited symptoms of *inveterate poison*. The amount of

the defence admitting the facts, was that the liquors were no more poisonous than are sold by others. "under licence from the crown." Among the witnesses on the part of the accused, was Wm. Ratchford, who stated that he had been a planter in the island of Jamaica—that the liquor called rum or spirits, was distilled in copper stills, (iron would taint the liquor black in its appearance) that the *fermented liquid* from which rum is made, is in its nature an *acid*; that its effect upon the interior of a still is quite apparent, inasmuch, that spirituous stills in use are constantly *losing in weight* and require often to be renewed; that the deleterious matter consequently combines with the liquor.—Verdict of Jury—Not Guilty.

Curiosity.—A short time since, a gentleman in this neighborhood, in opening a vein of coal, by means of a drift, struck upon what he believed a large tree, from ten to fifteen feet from the surface, standing in a perpendicular direction close by the vein. Upon more minute examination, it proved to be about two feet in diameter, and substance which was once a tree: but was neither in a carbon or preterent state. Its external parts appear to be in a great measure carbonized, but the heart was of a light brown colour. The most conclusive proofs of its having been a tree are, that in breaking it off crosswise of the grain, the circular growths were quite perceptible, and easily counted. The irregular interstices and unevenness of the bark, so unlike any thing else, were also distinctly visible. We mention the matter for the benefit of the curious and the antiquarian. How and when it came there, what the substance really was and how it became transmuted, are questions for them to solve.—*Miner's Jour.*

A raising without rum.—A building was lately raised in Williamsburgh without the aid of ardent spirits. Perfect order was preserved, and the company separated, much pleased with this new mode of raising—expressing their entire approbation of the plan, and earnestly recommending it as a subject worthy of the attention of the community.

Another. The frame of a dwelling-house erecting for C. A. Dewey, Esq. in this town, by Mr. A. Abell and Mr. C. Smith, (the contractors) was raised a short time since, with the greatest facility, without using any ardent spirits.

The roof of the new brick meeting house in Barre, was raised last week, expeditiously, quietly, and safely, without the aid of any ardent spirits—and that the master-workmen, masons and carpenters, have thus far carried on the whole work without furnishing spirits for their men.

In Montpelier, Vt. an elegant brick house has been erected the present season without using ardent spirits; and in Wheelock, Vt. the frame of a large meeting-house was raised a few days since, without the least assistance from the poisonous liquid.—*Hamp. Gaz.*

Lightning.—The excessive heat of yesterday, (says the N. Y. Statesman of June 20) was allayed by a thunder shower in the afternoon; in the course of which, a young woman was killed in Duane-street, by the lightning. It also struck in some other parts of the town, and shattered a poplar tree near Col. Rutgers'. We have had the warmest July weather for some days past, but not quite so intense as at Augusta, Ga. where the thermometer stood at 92, on the 5th inst.

MILLET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of *superior quality*; gentlemen in want of this article are requested to call and examine it.
Also, a further supply of Orchard Grass, Lucerne, Fowl Meadow, Mangel Wurtzel, Sugar Beet, Ruta Caga, Russian Flax, Lima Beans, &c. with several new varieties of Turnip Seed from Europe, including the Yellow Malta, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh White Mustard Seed.—Also, Green Citron, Pine Apple, and Pomegranate Melons; Carolina and Long Island Water Melons.
For sale at the New England Farmer Seed Store, a few pounds of Long White Summer Naples Radish, a variety highly esteemed in the Southern States.

For Sale.

A valuable real estate in Milton, pleasantly situated, 9 miles from Boston, on the turnpike road leading from Boston to Taunton, Bridgewater and New Bedford, containing about 300 acres of the variety of lands, and fruit suitable for a good farm, well watered, with good substantial and convenient buildings. Said farm is calculated to suit a gentleman of taste—or an enterprising young man for a milk establishment, being an excellent grass farm. The purchaser may have with the buildings from 100 to 200 acres to be sold or leased. Purchasers are requested to call and examine the soil and crop at this season; possession may be taken at any time from this to the first of April next. Conditions liberal. For further particulars inquire of the publisher of the N. E. Farmer.

Milton, June 10, 1825.

Gunpowder, &c.

De Poul's Gun Powder, at 23 to 50 cts. per pound—Shot—Balls—Plugs and Percussive Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the Dupont Powder Store, No. 65 Broad street—By E. COPELAND, Jr.

De Poul's Gun Powder sold as above, is warranted first quality—and is marked "E. Copeland, Jr. Boston," on the head of the cask. March 14

Valuable Stock.

For sale 7 Heifers, 2 and 3 years old, raised from some of the best Cows in this State, by Denton. Five of them have brought Calves this spring, and bid fair to make excellent milkers. They were selected by the present owner from the best of his stock, to be kept on his own farm, and are offered for sale in consequence of his having disposed of his farm. They are worthy the attention of any farmer who wishes to obtain good stock.

Also, 2 Horse Colts, 1 and 2 years old, by the imported horse Roman, from excellent mares, well known in this city. Apply to the publisher of the N. E. Farmer. June 6

Bull Bolivar.

The high bred imported Improved Short-horned Bull Bolivar, will stand at the subscriber's stable in Charlestown, Mass. Price \$5 for each cow for the season. This bull was selected by Mr. Coates, the keeper of the Herd Book, without limitation of cost, for the use of the Powelton stock, and is so highly valued by Col. Powell, that he has always refused to sell him, and has consented to part from him but for a season, considering him in form, points, and pedigree, equal to any animal to be had in Great Britain.

Bolivar is red and white, is not three years old, and has never been forced; yet he gets immediately behind his fore legs 7 feet 8 inches. The singular neatness of his shoulder, the straightness of his back, the width of his loin, the smallness of his head, neck, and ossa, the quickness of his gait, together with the well known character of his family as dairy stock, render him one of the most desirable males for improving our neat cattle, that can in any country be found.

SAMUEL JACQUES, Jr.

This day published,

And for sale by S. G. Goodrich, No. 14, Washington-street, THE LEGENDARY—Vol. I. Consisting of Original Poems, in prose and verse, principally illustrative of American history, scenery, and manners. Edited by N. P. Willis.

It is proposed to continue this work, and to publish a volume once in 3 or 4 months, if the encouragement is sufficient. The volumes will be sold separately—price \$1.25 per vol. j. 6

Ornamental Flowers.

For sale at the New England Farmer Seed Store, a large variety of Ornamental Flower Seeds, in papers of six and a quarter cents each; likewise done up in packages comprising 20 varieties, each sort being labelled, at \$1 per package.

Field Beans.

For sale at the New England Farmer Seed Store two barrels of small white prolific Field Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and are all of the growth of 1825.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty per cent.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VI.

BOSTON, FRIDAY, JULY 4, 1828.

No. 50.

NATURAL HISTORY.

FOR THE NEW ENGLAND FARMER.

INSECTS ON PEACH TREES.

[The following able and useful article was written for the last number of the Massachusetts Agricultural Journal, in answer to a letter from JOHN LOWELL, Esq., President of the Massachusetts Agricultural Society, and one of the Editors of that Journal.]

Millon, June 6, 1828.

DEAR SIR—The insects which you sent, are *plant-lice*, or *Aphides* peculiar to the leaves of the Peach-tree. Scarcely a plant exists to which a species is not appropriated, and hence most of them are called by the name of the plant on which they live; as *APHIS Rosæ*; *APHIS Cerasi*; *A. pruni*; *A. Brassicæ*; &c. &c.; and this species may be called *APHIS persica*.

Aphides are furnished with a proboscis with which they puncture the leaves, their pedicels, the buds, or the young twigs of plants, and through it draw the sap for their nourishment.—Those which derive it from leaves proceed from minute eggs, deposited the preceding year, near the leaf-buds: the eggs endure the winter, and are hatched as soon as the buds begin to expand. The aphides, by pumping the sap from the under surface of the leaf, cause it to project above, in irregular convexities of a reddish colour, and, at length, to become tortuous and changed in structure. Independently, then, of the exhaustion of the sap, by those small insects, the tree suffers in consequence of the interruption or imperfect performance of the functions belonging to the leaves.

De Geer,* when describing the aphids of the Elm, informs us that the aphid hatched from the egg in spring, the mother of the succeeding race, by repeatedly wounding the leaf, causes it to curl, and become unequal, thus forming a secure shelter for her young. Reaumur† asserts that it is only when the leaves are young and tender that this deformity is produced, and that, when the leaves are fully grown and tough, they are not altered in form by the punctures of aphides.

The aphid of the peach-tree is very briefly noticed by Kirby and Spence, (Introd. vol. i. p. 202, edit. 2d.) but does not appear to have been described by entomological writers.

The economy and habits of all aphides are similar, or vary only as it respects the part of the plants on which they subsist. The first which appear in spring are hatched from eggs, and are *females only*. They change their skins repeatedly, and perish soon after bringing forth their young. These young aphides proceed in the same way, being also viviparous; and the race is continued by a succession of viviparous females till autumn, when males and females both appear, and terminate the series for the season. The product of their union is however changed; for these females deposit the eggs before-mentioned, which are destined to continue the species another year, through several successive generations, without the intervention of males.

This is not the only wonderful fact in the his-

tory of aphides; there is another which is equally true of all species.

Wherever Aphides prevail there will ants endeavor to gain access. They are attracted by the sweetish fluid which exudes from the two little horns terminating the body of the aphid. The ants not only collect this from the surface of the leaves, but catch it as it is ejected by the aphides, and even compel them to yield it at their pleasure. This they effect by patting briskly and alternately each side of the body of the aphid with their antennæ: the flow of the fluid being thus stimulated and accelerated, and distilling drop by drop, is greedily swallowed by the successful operator.

Ants are, of course, on the most friendly terms with aphides; but the latter have redoubtable enemies of the insect kind. These are the larvæ of the lady-bug, (*COCCINELLA*) that of the foetid lacewinged fly, (*HEMEROBIUS*) and that of a two-winged fly, (*SYRPHUS*.)

The first is an elongated, flattened, blueish larva, spotted with yellow or red, and having six legs near the head. It may often be seen on lousy plants, where it regales itself by feasting on the numerous carcases which its superior size and strength enable it to slaughter. As the genus *COCCINELLA* not only abounds in species, but also in individuals, it is very generally diffused amongst plants, and its services are very considerable.

The second Aphidivorous insect is the young of a fly, having 4 wings resembling the most delicate lace, with brilliant eyes; but which, notwithstanding its beauty is extremely disgusting from the powerful excrementitious odour it exhales. This fly (*HEMEROBIUS perla*), suspends its eggs by threads in clusters where aphides prevail. The larva is provided with a pair of large, curved, and pointed teeth, moving laterally, and perforated with holes, through which it sucks the juices of its victims. The havoc it makes is astonishing, for one minute suffices to destroy and extract all the fluid of the largest aphid.

The last are the grubs of two-winged flies (*SYRPHI*) of various kinds. Some of these flies are black with yellow spots on the body. I have often seen them about trees and plants depositing their eggs, which they do on the wing, like the Bot-fly, curving the tail beneath a leaf and leaving an egg where aphides are discovered.—Others lay their eggs near the buds of trees, where the young may find their appropriate nourishment as soon as hatched. These grubs are pointed near the head and larger towards the tail; their mouth is furnished with a triple point-

that the first generations of Aphides are the most numerous, and that they progressively decrease in numbers. This arises from several causes; one is the slaughter of the race by its enemies; the second is that some become winged and fly away to other trees; the third cause is that they become gradually less prolific, till the appearance of a few oviparous females and still fewer males terminates the series. This circumstance is a curious fact in physiology. A single impregnation in the autumn is sufficient for the foundation of all the generations the next year. Prolific females only are produced, and these, at first, in great numbers; though their successors still continue to bring forth their kind, the energy of the impregnation would appear to be gradually lessened from the gradual decrease of their numbers, till, at last, it is exhausted at the birth of a few males and females, whose care it is to provide for another era in the race, by the production of the above-mentioned wonderfully fertilized eggs. (See also Encyclopædia Artus.)

ed dart, with which they pierce their prey, elevate it into the air, and devour it at leisure. What is more singular still, that this grub is entirely blind; but the provident care of the parent fly, in placing it in the very midst of the sluggish aphides, enables it, without much groping about, to detect and destroy them by hundreds.

Mr Kirby says that on examining his currant bushes, which but a week before were infested by myriads of aphides, not one was to be found; but beneath each leaf were 3 or 4 full fed grubs of the Aphidivorous fly, surrounded by heaps of the slain, the trophies of their successful warfare. He also says that he has found it very easy to clear a plant or small tree of lice, by placing upon it several larvæ of *COCCINELLA* of *SYRPHI*.

Aphides are not the only insects which cause the deformity in the leaves of trees. I am persuaded that a minute elongated Thrips contributes greatly to the same disease. (One of the larvæ was concealed in a leaf you sent me, and I have frequently seen them on the Peach-tree.) I am led to this conclusion from having frequently examined small trees where the leaves were curled, without being able to discover either aphides, their skins, or the aphidivorous larvæ; but have found one or two larvæ of the THIRPS, or the perfect insect beneath nearly every leaf. Linnaeus conjectured that the monstrosity observed on the flowers of a kind of *LOTUS* was caused by these minute insects; and I have repeatedly detected them in similar excrescences of leaves and flowers. Since they, like the aphides, are furnished with a proboscis, it is highly probable that, like them also, they use it in inflicting the same detestable punctures. The largest THIRPS does not exceed one line in length, and hence they are not readily detected.

I have tried various methods to destroy plant-lice, and give the preference to a decoction of tobacco. This may be thrown upon the trees by means of a garden engine; and if the stream be directed beneath the limbs with considerable force it will not only dislodge but kill the lice. A solution of potash or soap-suds, would, perhaps, answer the same purpose. Fumigation with tobacco is also successful where it is practicable.

Please excuse haste.

I am, dear sir,

very respectfully,

your humble serv't,

T. W. HARRIS

FOR THE NEW ENGLAND FARMER.

STATE COLLECTION OF MINERALS.

MR. FESSENDEN,—The rapid improvements in agriculture, manufactures, and the facilities for internal commerce, bringing into requisition all our resources from the mineral kingdom—ledges of granite, marble, slate, and soap-stone—beds of marl, clay, peat, and sand—ores of iron and other metals, are all needed to prosecute the great works of improvement, and to advance individual as well as public prosperity. About two hundred and fifty different species, or varieties of minerals have already been discovered in the State of Massachusetts, and many of them applied for the benefit of the arts. Numerous deposits and some va-

* Vol. iii. p. 82. † Vol. iii. p. 296.

See Kirby and Spence. Introd. vol. ii. p. 89, do. vol. p. 178. Also Reaumur, and De Geer. It is to be observed

ricities, doubtless, remain yet to be discovered—ought certainly to be more generally known, and more extensively applied to their legitimate uses. In connection with this subject, every one will see that a State deposit of minerals, must be of extensive utility and of very easy accomplishment. It would furnish not only to members of the legislature, but to citizens generally, on their visit to the metropolis, a convenient opportunity of an acquaintance with their mineral productions and resources. And numerous individuals in various sections of the State, already possess interest and knowledge enough upon the subject to lend their aid to forward it. Through the medium of legislators, a collection from their several towns might very soon be made, and with great ease. And it is hoped and believed that the legislature would cheerfully appropriate a room in the State-house for the collection, and funds sufficient to defray the expense of transporting, &c.

Several States in the Union have already procured collections of the kind proposed; and if a deposit should be made in the capital of each State, an exchange might be instituted, which would be mutually and extensively beneficial to the whole community.

FRANKLIN.

We entirely concur with the views of the above article respecting the importance of a deposit of minerals of the kind above described. Mineralogy is a science of great practical importance, and intimately connected with agriculture and the course with the prosperity of the country. Man would be a savage, without minerals; deprive him of iron and you destroy more than three fourths of his physical powers. Mineral substances which are valuable for manures, for buildings, for painting, pottery, medicine, and other purposes, embrace almost the whole circle of the useful arts may have undiscovered for ages, in accessible situations, but of no use, unless manifested, merely for the want of a little skill in mineralogy, a knowledge of those appearances, soils, strata or layers of earth, which are infallible indices of the presence of minerals. We have no doubt but that there are thousands of acres of barren land, in the United States, which contain ten times as much value, at present undiscovered, and beneath the earth's surface, as the same number of acres of fertile land would produce on their surface with the best cultivation. A knowledge of mineralogy gives a key to unlock these subterranean hoards, and enables us to open the *strong box*, in which Nature has deposited her treasures.

An acquaintance with mineralogy is useful, not only by giving us information of what *may be found* but of what *may not be found* in any particular soil or location. No saline, fossil or metalliferous bodies ought to be sought after, by any expensive and laborious excavations, unless the laborer is guided by the lights of science. Great expenses are incurred by unskillful efforts to dig coal, salt, lead, and perhaps silver or gold, in situations where nothing of the kind ever existed. This might be avoided by a knowledge of mineralogy; and that knowledge can hardly be acquired without specimens.—*Editor.*

FOR THE NEW ENGLAND FARMER.

FELLING TIMBER.

MR. FESSENDEN,—In vol. 24 of the New England Farmer, were published a few facts respecting the most proper time for felling timber, that

we intend to have the most durable, and yet have it exposed to the weather.* At the time of writing those statements, I had one experiment going on, which had not come to a result. In September 10, 1822 I bought a maple log, and felled it for timber to work into a mill. After working what I wanted at that time, the remainder was left exposed to the weather. In June 1823, I had another felled, and left part of it exposed to the weather by the side of the other. In October, 1825, I examined both pieces, and found the one that was felled in June was affected with white rot, all through the timber; but on examining that which was cut in September, I found the outside colored in about one fourth of an inch; the remainder white, and as good for timber as it ever had been.

In 1827, in August, I was making an engine to a paper mill, and had timber to work, which was felled in June, about the 10th. The bark was left on until we worked it, when to our surprise, the white sap-wood, in some places had been rotten. This was the Quercus alba, white oak. From a consideration of the approaching scarcity of timber, in this part of the country, I have been led to communicate these remarks, not with a view of contradicting any person, for I think that a few degrees of latitude may make some considerable difference in the time when trees cease to extend their branches, and form their leaf and fruit buds for the next year, which is an indication that the sap is undergoing a change, and ceases to descend; a doctrine, which I shall attempt to demonstrate by some experiments I have made, which are conclusive to my mind. But this I must omit till another opportunity.

In this latitude, and to one degree north—and nearly one to the south—the leaf and fruit buds are mostly formed in August, with here and there an exception; we find some formed in July, and some not until September. These last are not timber trees; and I think that in the latitude of Philadelphia, timber trees standing on a southern declivity, may be as mature in the last of June, as here in September; and what Mr. Cooper has said, may be as correct there for June as what we have said for September here. But the fact that timber trees do cease to extend their branches in June, and form their buds on the banks of the Delaware would be gratifying for me to learn. One other fact would be useful to ascertain—that is, whether there is the same acid in timber trees in June that there is in September. In this latitude, timber that is felled in September will not suffer from red rot; nor will the powder-post worm ever touch it. Take a young walnut, say one large enough for barrel hoops, and give it any exposure you please (not placing it in the fire) and it will not lose its force in two years; nor will the powder-post be found upon it, whereas take it in June, and it will perish the first season.

I have subjoined a table, showing the comparative value of timber felled at the two seasons of the year above mentioned, in which I am correct, or nearly so.

Oak,	Sept. 10.0	June 4.5
Maple,	Sept. 10.0	June 2.4
Walnut,	Sept. 10.0	June 2.5
Elm,	Sept. 10.0	June 1.6
Ash,	Sept. 10.0	June 3.2

* See likewise, page 306 of the current volume of the New England Farmer. † *Ibid.*

But by comparing the four last with white oak, provided they were all felled in September, they will stand nearly thus:

Oak, 10.0	Maple, 5.5
	Walnut, 6.2
	Elm, 4.5
	Ash, 5.6

PHINEAS STEVENS.

GRAFTING.

MR. FESSENDEN,—Through the medium of the New England Farmer, I wish some of your correspondents would describe the best mode of management on grafted trees—say apple trees, that have this spring been headed and grafted—whose trunks are from ten to twenty-five inches in diameter, and have from twenty-five to one hundred stocks on a tree. Whether it is best to keep the young sprouts or suckers clear from the trees, or suffer them to remain to receive part of the sap? And if taken off, at what time it is best? And whether to take all at once, or part? This information would be gratefully received by one interested in the advancement of good fruit.

Yours, with respect,

A SUBSCRIBER.

Wreston, June 28, 1828.

N. B. I have had upwards of 4000 scions set this spring, of which I think not fifty have failed of taking. Among which are pears growing in the best stocks and the forest hazel; apricots, peaches, and mulberry scions growing in plum tree stocks. Most of my scions are apple—the largest tree has one hundred and fifteen stocks.

From the New York Statesman.

CULTURE OF SILK.

The following important article on this subject is from a southern paper: "By a letter published in a recent number of the American Farmer, it appears that the silk worm and its proper ailments are of spontaneous growth, in the State of Mississippi. The writer (a Mr. Benton of Vicksburgh), states that the cocoons are about as large as a hen's egg, and that they differ from all others, in having a bulb on the outside, in all respects similar to that which encloses the worm. They are found sometimes upon the lime, and sometimes upon the cane; when on the latter they are small—when on the former, larger than upon the mulberry. The country abounds with mulberry trees—mostly black and red, though there are many of the white."

The success attending the culture of silk in several parts of the United States, and particularly in the State of Connecticut, has awakened public attention to the subject. From the foregoing extract, it would seem that the United States is more favored than any other part of the world; inasmuch as the silk worm with all the varieties of the mulberry (the leaves of which have been supposed to be its only appropriate food) are native productions of our soil and climate. By the extract referred to, it seems the lime tree also affords sustenance calculated to nourish and sustain these animals in great perfection. Should the United States, with the advantages she possesses, in a very few years produce her own supplies of silk; and moreover, should it hereafter form an impor-

tant article in the catalogue of our exports, it ought not to excite our wonder.

If in 1816, any friend of the American system had predicted, that within twelve years from that time, \$30,000,000 of coarse cottons, would be spun, by yankee machinery, in a single year, and that our exports of domestic goods to other countries would annually exceed 6,000,000 dollars, he would have been pronounced little better than insane—but facts now show that he would have predicted nothing beyond reality. Women, children, and infirm persons may do nearly all that is required for growing this article. Let John Bull gainsay ever so often, and strong, we have proved that we can spin, and weave, and bleach, and dye. Messrs. Burritt & Clayton's commercial list informs us, that 170 packages of cotton goods were shipped from this city to foreign ports last month. This information is obtained from our custom-house books. Every yard made by yankee industry, and to take the place of British and East India goods.

But not to wander from the subject with which we commenced—we cannot but rejoice at the growing interest which is awakened in relation to the culture of silk. The quantity purchased of foreign countries, is enormous. In 1825 it amounted to \$10,271,527. What a quantity of flour at five dollars per barrel it will take to pay for the proportion which we consume of this immense import? We are pleased that this subject has attracted the attention of the American Institute of this city. At the last meeting of this association Dr. Pascalis read an interesting memoir, prepared by himself, on the mulberry. To avoid the tedious delay of many years which is required for the mulberry to grow to perfection, the eastern people plant the seeds in rows, and thereby are enabled in a short time, to obtain an abundance of leaves which serves as food for the silk worms. This time-saving expedient has greatly increased the production of silk in some of our sister States—and gives another illustration, that American ingenuity can effect in a few days what in Europe is thought the labor of an age.

From Poulson's American Daily Advertiser.

MAGNOLIA MACROPHYLLA.

The magnolia macrophylla, one of the most magnificent of our native trees, is now in full bloom at the nurseries of D. & C. Landreth, near Philadelphia, and is so truly worthy of notice that I cannot refrain from attempting a description of it for insertion in your columns. The specimen to which I more particularly refer (for their nurseries contain several of considerable size,) is estimated at upwards of thirty feet in height, and measures, three feet above the ground, about eight inches in diameter. The leaves when fully grown, at which state they do not arrive before July, are generally, foot stalk included, from twenty-four to thirty inches in length and eight or ten in breadth. The upper surface is smooth, of a light green color—the under glaucous, form a coating of pubescent, and marked with prominent veins, alternately proceeding from the mid-rib—and are variously arranged in clusters of four, or more, near the extremity of the branches.

As respects the flower, it is difficult to give a description calculated to convey an adequate idea of its majesty. Mr. Nuttall, in his "Genera of American Plants" states it to be the largest flower

of any other American plant. In the nurseries herein referred to, they generally measure eight inches in length, and when fully expanded, sixteen inches in diameter, giving a circumference of nearly four feet. It is composed of but six petals, white, or slightly inclined to a cream color. The three inner ones, marked near the ball, with a purple spot of about an inch square—forming a remarkable contrast with (this excepted) its unspotted purity.

Let the reader figure to himself, a tree of the size here named, with clusters of immense leaves, hanging pendant, or horizontally, and waving in the air like vast two-colored wings—the extremity of each branch, crowned with a flower of the size to be individually conspicuous at a distance of two or three hundred yards, and he has but a faint idea of the tree attempted to be described. The contracted localities in which this tree is found growing indigenously has been remarked by all the botanists who have traversed our continent. Mr. Nuttall says he first observed it near the banks of Cumberland river, in Tennessee, but of small size. Michaux observes in his North American Sylva, 3d. half vol. p. 26, "in the month of June, 1789, in the first journey made by my father from Charleston to the mountains of North Carolina, I accompanied him and discovered this tree, which he immediately judged to be a new species of magnolia. The spot on which we found this magnificent vegetable, is in North Carolina, ten miles south of Lincolnton, and two hundred and fifty miles from Charleston. Our extensive researches in quest of it in the upper part of the southern States, and those subsequently made by several English botanists, east of the Alleghanies, which were alike unsuccessful, sufficiently prove that it is extremely rare between the mountains and the sea. West of the range in Tennessee, it is more common; but even here, only a few trees are found together at intervals of forty or fifty miles, as I had an opportunity of observing during my journey in the western States in 1803." It is now many years since it was added to the collection of the Messrs. Landreth, and is found perfectly hardy, the youngest plants enduring the severest frosts uninjured—easily cultivated, and thriving readily in most situations. It is, therefore, much to be regretted that it yet remains to be generally introduced.

The changes wrought on many vegetables by careful cultivation and attention is too generally known to be necessary to repeat, and the present case is an instance of it worthy of remark. Michaux states, that in its native soil, "it does not exceed thirty-five feet in height, and four or five inches in diameter." The estimate of the height of the specimen here spoken of is believed to be pretty accurate, and should no accident interfere, it will certainly attain a much larger size, the shoots of each year being strong and vigorous.—The diameter of the tree is from actual measurement. The flowers he also states "when fully blown, are sometimes eight or nine inches in diameter;" and a size but about one half which they arrive at in the nurseries herein referred to.

ENGLISH AGRICULTURE.

The English carry agriculture to great perfection. Every spot of ground capable of cultivation is improved. Wherever I have been, the fields are generally small, enclosed by hedges and made perfectly smooth, by means of cast iron rollers. Nu-

merous trees are left to grow around the hedges, and scattered over the fields. These are so neatly trimmed, as to add greatly to the beauty of the country. Not a weed is suffered to grow. The crops all look well, and are much more productive than ours. The cattle and sheep feed on grass up to their knees, and look, as we should say, fit to kill.—the slight enclosures that keep them in their pastures, would be but a poor protection against our lean, half-fed, unmanly animals. Here the cattle have no need to break fences.—They have food sufficient within their own domains. I came here under the impression that the country was bare of trees. On the contrary, I find it better stocked in this respect than the thick settlements of our own country. We wantonly destroy trees as if they were of no value; here they are planted and nursed with as much care, as though they bore choice fruit.—*Extract of a Letter from England.*

WATER CULTIVATION.

In the fair New England country, many a little stream flows down the hills and glitens among the verdure of the fields like a thread of silver on a robe of green, inviting the hand of skill to direct its course so as to spread the rich deposits, washed into its channel by the rain over the fields of the farmer. The effects produced by irrigation, even in seasons when the clouds are liberal of moisture, can be distinctly traced by the eye whence the rivulets are poured on the grasses—effects not so much derived from the moisture as from the fertilizing particles borne on by its current. The hills which slide down so copiously from their little mountains, may be made tributary to the purposes of agriculture, to an extent more considerable than is estimated by those who neglect to employ agents so valuable and laborers so profitable.—*National Enquirer.*

ARABIAN METHOD OF PREPARING COFFEE.

It is found that the only certain mode of retaining the pure flavor of the coffee, is to roast, pound and boil it, all in quick succession, the roasted berries, soon losing their flavor if laid by for a day, and the pounded coffee becoming insipid, even in a few hours. The Arabs of the desert, who are from necessity economical in the use of this article, follow the same process, even if they require only two cups of the liquid, roasting a handful of berries on an iron plate, pounding them in the pestle and mortar while warm, and the instant the water boils, which it generally does by the time the other preparations are completed, so that no time is lost, putting the pounded coffee into it, and suffering it to boil, stirring it at the same time for a minute or two, when it is poured out to drink. As the beverage is taken without sugar or milk, the slightest difference in flavor is perceptible; and long experience having shown this to be the best way of preserving it in perfection, it is perhaps worth mentioning in detail, particularly as the use of this article has become so general even in England.—*Buckingham's Travels.*

Six convicts lately escaped from the Kentucky Penitentiary, supplied themselves with arms and ammunition belonging to their vigilant guard, continued in platoon, as banditti, for five days within twenty miles of the prison, then struck off for the river, stole a flat boat, and embarked as river pirates.

CULTURE OF HEMP.

The hemp is a plant of equal antiquity with the flax. It is supposed to be a native of India, or of some other Asiatic country, being too tender to be even naturalized in Europe. It is one of the few plants employed in British agriculture, in which the male and female flowers are in different plants, a circumstance which has some influence on its culture and management. It grows to a great height on good soils, sometimes to six or seven feet in this country, but in Italy generally higher; and Cuvier states that he has seen it fifteen feet eight inches high in the Bolognese territory, and a friend of his, eighteen feet six inches: in both cases the fibre being of remarkable beauty. This luxuriance of the hemp in warm countries may be one reason why it has never been cultivated in England. In Asholme, in Lincolnshire, it has been cultivated from time immemorial, and also for centuries in Suffolk, but chiefly for local manufacture. The culture, management, and uses of hemp, are nearly the same as of flax. When grown for seed it is a very exhausting crop; but when pulled green, it is considered a cleaner of the ground, and is said to have the property of preserving from insects any crop which it may surround. The objections to this crop are, that its coming in the midst of harvest is embarrassing; and that the attention it demands in every state of its progress is too great, where it is only a secondary consideration.

The soils most suitable for hemp are those of the deep black putrid vegetable kind, which have a situation low, and somewhat inclined to moisture, as well as the deep mellow loamy-sandy sorts. But the quantity of produce is in general much greater on the former than on the latter; though, according to some, of an inferior quality. Mellow rich clayey loams do well; and nothing better than old meadow land.

The preparation of the soil, and place in the rotation, are the same as for flax.

The season of sowing is towards the end of April, when there is no longer any danger of frost injuring the rising plants. The quantity of seed is from two to three bushels, according to the quality of the land. In quality the seed must be fresh, heavy, and bright in color. Broad-cast is the universal mode of sowing, and the only after-culture consists in keeping off birds when it is coming up; in weeding, and sometimes in supporting the crop by cross rods or lines, as in the case of flax.

In taking the hemp crop, two methods are in use according to the object in view. When the crop is grown entirely for the fibre, it is pulled when in flower, and no distinction made between the male and female plants. But as it is most commonly grown, both with a view to fibre and seed, the usual practice is to pull the male plants as soon as the setting of the seed in the females shows that they have effected their purpose. As the female plants require four or five weeks to ripen their seed, the males are thus pulled so long before them.

In the operation of pulling the males, the pullers walk in the furrows, between the ridges, and reach across to the crown of the ridge, pulling one or two stalks at a time, and carefully avoiding to tread down the female plants. The male stalks are easily known by their yellowish hue, and faded flowers. They are tied in small bundles, and immediately carried to the watering pool, in the manner of flax.

The operation of pulling the females commences when the seed is ripe, which is known by the brownish or greyish hue of the capsules and fading of the leaves. The stalks are then pulled and bound up in bundles, being set up in the same manner as grain, until the seed becomes so dry and firm as to shed freely; great care should be taken at pulling not to shake the stalks rashly, otherwise much of the seed may be lost. It is advised, that, after pulling the seed, hemp may be set to stand in shocks of five sheaves to dry the seed; but in order to prevent any delay in watering, the seed-pods may be cut off with a chopping knife, and dried on canvass exposed to the air, under some shed or cover. This last method of drying the seed will prove of great advantage to the hemp, as the seed and pods, when green, are of such a gummy nature, that the stems might suffer much by sun-burning or rain; which will discolor, and injure the hemp before the seed can be sufficiently dried upon the stalks. Besides, the three-shing-out the seed would damage the hemp in a considerable degree.

Hemp is watered (provin. water-retted), bleached (provin. dew-retted), and grassed in the same manner as flax. Grassing is omitted in some places, and drying substituted; and in other districts watering is omitted with the female crop, which is dried and stacked, and dewed or bleached the following spring. On the continent hot water and green soap has been tried, and here as in the case of flax, it is found that steeping two hours in this mixture, is as effectual in separating the fibre from the woody matter, as watering and grassing for weeks.

Although hemp in the process of manufacturing, passes through the hands of the breaker, heckler, spinner, whisteter, weaver, and bleacher; yet many of these operations are frequently carried on by the same person. Some weavers bleach their own yarn and cloth, others their cloth only; some heckle their tow, and put it out to spinning, others buy the tow, and put it out; and some carry on the whole of the trade themselves.

The produce of hemp in fibre, varies from 3 to 6 cwt. per acre; in seed from 11 to 12 bushels.

The uses of hemp are well known, as well as its great importance to the navy for sails and cordage. Exceedingly good luekaback is made from it, for towels and common table-cloths. The low-priced hempen cloths are a general wear for husbandmen, servants, and laboring manufacturers; the better sorts for working farmers and tradesmen in the country; and the finer ones, seven-eighths wide, are preferred by some gentlemen, for strength and warmth. They possess this advantage over Irish and other linens, that their color improves in wearing; whilst theirs declines English hemp, properly manufactured, stands unrivalled in its strength and is superior in this respect to the Russian. Considerable quantities of cloth are imported from that country for sheeting merely on account of its strength, for it is coarser at the price than other linen. Our hempen cloth, however, is preferable, being stronger from the superior quality of the thread, and at the same time lighter in washing. The hemp raised in England is not so dry and spongy a nature as what we have from Russia and India, and therefore it requires a smaller proportion of tar to manufacture it into cordage. Tar being cheaper than hemp, the rope-makers prefer foreign hemp to ours, because they can make a greater profit in working it; but cordage must

be stronger in proportion, as there is more hemp, and less tar in it, provided there be a sufficient quantity of the latter to unite the fibres. An oil is extracted from the seeds of hemp, which is used in cookery in Russia, and in this country by painters. The seeds themselves are reckoned a good food for poultry, and are supposed to occasion hens to lay a greater quantity of eggs. Small birds in general are very fond of them, but they should be given to caged birds with caution, and mixed with other seeds. A very singular effect is recorded, on very good authority, to have been sometimes produced by feeding bulfinches, and goldfinches, on hemp seed alone, or in too great quantity; viz. that of changing the red and yellow on those birds to a total blackness.

The hemp has few or no diseases.—*Encyc. of Agriculture.*

Patent trial.—An important trial has lately taken place in New York, for an infringement of Dr. Hull's patent improved TRUSS. The defendant sold trusses made by Hovey and by Farr, who also have subsequent patents. There were two grounds of defence:—one, that the trusses sold were different in principle from Dr. Hull's,—and the other, that Dr. Hull's were only an imitation of those made by Oddy & Co. of London. Dr. S. Mott, Perkins, Rees, Osborne, and Stearns, testified to the originality, utility, and distinguishing qualities of Dr. Hull's truss, and that those made by Hovey and by Farr, were imitations of them. The court directed the jury that

The usefulness and novelty of this invention had been established by physicians and surgeons of the highest respectability. It appears very fully in evidence, that this instrument was of the greatest value in surgery—had been the means of effecting cures in cases where the art had failed heretofore—had enabled persons afflicted with the disease of rupture, to pursue their business and labors without inconvenience, and in fact its invention had formed a new era in the treatment of that disease; that the instruments sold by the defendant, the one known as Mr. Farr's, and the other as Mr. Hovey's trusses, and by them patented, are clearly infringements of Dr. Hull's patent. The jury returned a verdict for the plaintiff, for the value of the articles sold; and the court, on motion, trebled the damages, according to the statute, with costs. And it was intimated that any further violation of the plaintiff's patent, would be restrained by injunction.—*Mass. Spy.*

Canker worms.—Many of the orchards in the eastern part of this country, says the Springfield Republican, appear to be nearly lighted or destroyed by these insects. The trees look, as if a fire had passed over them. These insects have also made their appearance in the vicinity of Boston. Previous to their approach, and where their destructive effects are now seen, the fruit trees promised an abundant harvest. We have heard that a thin mixture of tar, applied to the trunk of a tree, will prevent the ascent of the worm to deposit its eggs.

Fine Wool.—Jacob Heyser, Esq. of this vicinity, last season, clipped 403 lbs. of wool off of three Merino sheep. On Saturday last we were shown a pattern of a fleece of twenty-three and a half pounds, shorn from one of his flock this season.—The sample was the finest wool we ever saw, and measured twelve inches long.—*Pennsylvania paper*

TOP DRESSING GRASS-GROUNDS, &c.

By top dressing, much of the best properties of the putrescent manures are exhaled or wasted in the way that has been described; if to this be added the too general loss sustained by decomposition before the manure is applied, it will be found that but little good can be done by a great deal of it, when used in this way.

If dung be used for top dressing, it should be applied soon after the first crop of grass has been mown, and before the manure has suffered any material loss by fermentation. The grasses should be suffered to grow until they form a close shade; after this, they may be pastured, provided a good covering of them be preserved. This will prevent much exhalation; it will also keep the soil much more open to receive the juices of the manure.

As water does not pass so freely through a close pile of grass, much of the coarser particles of the washings from the manure will be arrested in their progress through it, and much more of the juices from the dung will sink into the soil. The close covering also greatly favours the decomposition of the litter, and by keeping it flexible, causes it to sink further into the soil, and lie much closer to it; therefore but little if any of it will be found in the way of mowing the ensuing crop of grass, or of making it into hay, provided the manure be very evenly spread over the ground. But as the want of the second crop for hay and other circumstances, may readily prevent the cultivator from hauling the dung at the proper time, he may haul and spread it any time before frost sets in; but not with the same advantage. Still, if care be taken in racking up the hay of the ensuing crop, but little of the litter will appear among it.

Top dressing, however, with putrescent manures, is, under the most favourable circumstances, a very successful practice, and should be avoided where population is sufficient to admit the practice of convertible husbandry; except by those who prefer the ease obtained by grazing exclusively, to a more active and much more profitable mode of management.

When ashes, gypsum, lime, &c. are applied to the grass grounds, it must be by top dressing.—But either of these substances is more extensively useful to cultivated crops, when they are properly incorporated with the soil.

It is difficult to calculate the losses arising from the prevailing practices of gathering, preparing, and using the manure that might be obtained from the general resources of a farm. Some manage better, and others worse. Neither weight nor measure to ascertain these losses, can be referred to. We may, however, form a tolerable estimate of their amount, by summing up the supposed losses arising from each improper practice, and, as well as it may be done, averaging the losses. This must centre between the best and worst practices in general use. I have done this, and believe the loss cannot be less than seven-eighths of the whole, which might be very readily saved by good management and a proper cultivation.—*Lowell's Husbandry.*

Parmentier's garden.—This garden and nursery, situated about two miles from Brooklyn, at the intersection of the Jamaica and Flatbush roads, is worth a visit, if only for the pleasure, of seeing man's earliest occupation, skillfully, and we hope profitably, pursued. To those, moreover, who may wish to purchase plants, fruit trees, or vines,

it offers a choice of the finest sorts, in the finest order. We saw there a few days since, vines of only two years old, bearing ten, twelve and fourteen clusters, apparently very healthy and thriving. Mr. Parmentier, (the proprietor,) is from Flanders, one of the garden spots of Europe, and combines with much practical knowledge of his art, great general intelligence. He will, we cannot doubt, find that the labor and expense, (both great) which he has laid out upon his garden, return to him with large increase.—*N. Y. Amer.*

American Asylum for the deaf and dumb.—We have seen and read with much interest, the 12th report of the directors of this noble Institution. It contains a mass of information, as curious as it is interesting to the friends of this unfortunate class of our citizens. We learn from it, that the whole number who have been educated at this institution, is two hundred and sixty-two; of whom one hundred and thirty-two are now members. It is a singular fact, that notwithstanding the asylum has been in operation nearly twelve years, only three have died while members of it. We also learn, that, besides the asylum at Hartford, there are four institutions for the instruction of the deaf and dumb in the U. States; 1 in Pennsylvania, 1 in Kentucky, 1 in Ohio, and 1 in New York, all of which are under the care of men, who have been taught the system of the Abbe Sicard, at the American asylum. It is probable, that other institutions will be established in the different States, and very soon the whole of this unhappy, and otherwise nearly useless class of citizens, will have an opportunity of being rescued from an almost perfect mental darkness. Massachusetts, New Hampshire, and Vermont have for a long time, supported a number of their indigent deaf mutes at the American asylum. The legislature of Connecticut, at their last session, appropriated 1500 dollars for this same benevolent purpose.—*N. E. Weekly Review.*

The following is an interesting and important fact which we do not remember to have met with before. It should recommend strongly the application of electricity for the relief of paralytic affections.—*Essex Register.*

Singular Effect of Lightning.—The ship New York, on a late voyage from New York to London, encountered a severe storm of thunder and lightning. There was a passenger on board, very old and very corpulent, whose legs were so paralyzed, that for three years he had not walked half a mile, and who, since his embarkation, had not been able even to stand. After the discharge of the lightning which passed close to the place, where this poor cripple was lying, every body was astonished to see him rise, pace up and down the deck, and walk about for a long time, as if nothing had even ailed him. At first his head was a little unsteady; but that soon went off, while the benefit which he had experienced in his limbs remained. He continued to use them freely during the passage; and on the arrival of the ship in port, he walked with ease to the place of his residence.—*Lon. Mech. Mag.*

The cultivation of potatoes has been introduced at the Grecian Islands by an Irishman named Stevens—and promises to supply the Greeks with food. The President of Greece has declared his gratitude to him

RURAL TASTE.

We are far behind the English in the comfort and appearance of our Farm-houses. On the other side the water they are content to build a house no larger than can be furnished or occupied, but our practice is too often the reverse of this for our zeal or money fails, and when the farm of the dwelling is covered, not a room is finished within, the windows are stuffed with old hats or rags, and the house stands a monument of the owner's taste and judgment. The houses of our farmers are of irregular shape, and tho' their deformities might be somewhat concealed by trees, the proprietor will give up his shade rather than his prospect.

An Englishman once told us that this want of shade about our houses, was the first thing that struck him unfavorably in the country; and this too in a land every where abounding in trees.—Regarding them, we would repeat the advice of the Scotch Laird, to his son. "Be aye sticking in a tree, they'll be growing while ye're sleeping."

There is also a flowering plant, the honey-suckle, which in some counties in England covers almost every cottage.

As to fruits, our farmers shew a wilful neglect of the blessings of Providence; not one in ten has pears, grapes, plums, or mulberries, which once planted, are hardy, and occasion little other trouble.

The above thoughts occurred to us in a ride of 18 miles in the country, which to our eyes never wore a better appearance than it wears at present.—*Evening Gazette.*

Grand hotel at Boston.—The project of erecting a spacious hotel at Boston, for the better accommodation of strangers, has been for some time in agitation in that city, and we learn from their papers that it is now in a fair way to be carried into successful operation. It is estimated that the land and building will cost 200,000 dollars, of which one half of the amount has been subscribed by the citizens at large, for the period of ten years, at the rate of 3 per cent. The hotel is to be erected on Common-street, and will cover the whole extent of the beautiful lot extending from Beacon-street, to the Granary burial-ground. The building will be four stories in height, one hundred and fifteen feet in front, with wings of more than one hundred feet in length. It will contain a large number of shops in front adapted to the convenience of the occupants. The workmen broke ground on the 24th inst. and the Courier states that it is the intention of the proprietors to lay the corner stone of the edifice on the 4th of July. The enterprising inhabitants of Boston deserve great credit for the spirit with which they carry into effect every project calculated to promote the prosperity, and growth of their city; and for the liberality with which they employ their capital in giving employment to their laborers, mechanics, artists, &c.—*Salon Reg.*

A valuable Donation.—The collection of the late Governor Clinton in science and natural history amounting to upwards of 1100 specimens having at the recent sale of his effects been purchased by Messrs. John T. Norton, and Edward C. Delevan of this city, those gentlemen have very munificently and appropriately presented them to the Albany Institute. May those who thus use wealth, always have it to use.—*Albany Chronicle.*

From the National Intelligencer.

DRUNKENNESS.

ITS CAUSES AND PREVENTIVES.

Gentlemen: Formerly, it was a trite proverb, that "Money is the root of evil;" but it has now become obsolete, since we never hear it mentioned any more.

What then can be the cause of the present depraved state of our morals? I think that we may trace it in the general use of *strong drink*, which now pervades every class: what I call strong drink is, any thing that causes merriment or more than ordinary flow of spirits. This is effected, in some, by a gill of brandy; and in others by a glass of wine.

There are several causes which lead to the present degraded state of society, in drinking, and which bid fair to make us a nation of drunkards surpassing all other nations in that vice.

In the first place, the cheapness of liquors with us, and particularly our domestic spirits, cannot but have a fatal tendency that way. If the States would recommend to Congress to lay a tax of 25 cents a gallon on all domestic spirits, (with a corresponding advance on all foreign) for a fund for internal improvements, and pay over to the Treasury every State all the moneys so collected in each State, then will that vice be made to contribute much towards the general good of society: for such a tax as that would produce a revenue sufficient to make a new stone turnpike through State every eight or ten years.

Another cause of Drunkenness is, our mistaken notions of hospitality, to always offering our dearest of slow poison to all our friends, whenever they enter our houses, and when we call at hotels, or other public places of resort, and calling for some strong drink; every child, no matter how young, must have a share of that poison, to them! Can it be wondered at, if we turn out to be a nation of drunkards, when we commence tipping while yet in the arms of a nurse?

Another cause is, that instead of having all our victuals cooked with the slightest seasoning of salt and without any pepper, or other pungent article—all of which ought to be kept in separate bottles on the table, so that each person could add to suit his palate—instead of which all our dishes are seasoned to suit the vitiated palates of the old, and not the purer ones of the children, who, if left to themselves, will refuse all pepper, &c. unless their taste has been already corrupted, by using these articles, or by strong drink, &c.

But, of all things, *tobacco*, whether in chewing or smoking, is the greatest provocative to the use of, and a preference for, strong drink: For no sooner does a person addict himself to the use of this strong and most nauseous of all weeds, than the mouth and palate lose all relish for milk or water, or any mild beverage, and long continually for something even stronger than this drug, to drink, and excite similar sensations on those organs which soon become much impaired in the facility of tasting. If those who use tobacco, would keep an account of the additional expenses they incur, in quenching the continued artificial thirst which is excited by the acidity of that poisonous weed, they will find, that it not only impoverishes their purse, but likewise their health. For I have heard a respectable physician say, that he could distil a poison from the tobacco, sufficiently strong to kill any man.

I have seen, repeatedly sucking infants, of a few weeks old, treated to a share of the raw rum gin, or brandy, to which the mothers had been treated, at various country stores and taverns.—Indeed, it is a common thing, in this Western world, for the common people to give their infants a dram of whiskey as soon as born! while I would as soon think of putting rat'sbane in the mouth of a child of mine, as any kind of spirituous liquor whatsoever.

When I was a youth, about forty years ago, it was rare to hear of a murder committed in these United States, in six or seven years; whereas, now we can scarcely take up a weekly paper, without finding an account of some murder, or murderous attempt! It is true, our population has increased rapidly during that time, and an increase of crimes must be expected with it; but still, not in that gigantic proportion in which we now find them.—It is therefore, chiefly, to the general use and cheapness of our liquors, that we might attribute that increase of crimes which now pervade this once happy country.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 4, 1828.

BRITISH ALMANACK FOR 1828.

A work with this title has been published in England under the superintendance of the Society for the Diffusion of Useful Knowledge. We have not seen this Almanack, but find in a late number of the Gardener's Magazine a recommendatory notice, from which we extract the following remarks, which suggest ideas, useful to an American as well as an English reader. "The compilations, bearing the names of Moore and Partridge, originally appeared above a century ago, and they continue to be published with much of the astrological predictions and prophetic imposture peculiar to that time. These works profess in the plainest terms to foretell the weather, even to a day, stating that on one day there will be rain, on another snow, and on a third thunder.—They also prophesy as to political events with nearly equal confidence, though not quite so distinctly. Thus one says that at a particular time 'there will arrive good news from Cadix, Scotland and Naples;' and another tells you that, about such a date, 'a great minister will be impeached,' or, 'a dignitary of the church driven from his preferment.' Nor are they free from party politics. One gives intimations and even prints of a nature calculated to set different religious sects in conflict; and another dates the year as the 150th from the 'horrid Popish Jacobite plot' thus keeping alive, for the purpose of exciting religious animosity, the memory of transactions which are a disgrace to the character of this country, and the worst blot upon the history of its law; affirming as real, crimes in a great degree imaginary, and grossly mistaking even the notions respecting that plot which prevailed at the time. Some parts of these almanacks are not marked by much regard to decency; but there are others also greatly circulated, which are utterly obscene, and could never be admitted into any decent house, had not habit unfortunately reconciled the community to such things, as well as the absurdities of their astrology."

"When it is mentioned that the sale of these works exceeds annually, 500,000, some idea may

be conceived of the tendency which they have to perpetuate notions which are far more adverse to the diffusion of enlightened ideas than ignorance itself. An ignorant mind will imbibe knowledge when it is presented; a mind prejudiced or bigoted repels every idea not in accordance with those already there. The one case is like sowing on a fallow field, the other like sowing on a field of weeds. The new *British Almanack* is a combination of all that is good or founded on truth in the other almanacks, and contains besides a variety of original matter."

The price of the British Almanack is 2s. 5d. sterling, equal to 50 cts. The proprietors of the work could of course afford to make that worth something which was considered of some value in market. In the United States there is such a competition among manufacturers of almanacks, that those commodities will fetch next to nothing, and it must be confessed are often worth no more than what they sell for.

REARING SILK WORMS.

By the kindness of Dr MEASE, of Philadelphia. (a gentleman whose enlightened philanthropic exertions to promote the useful arts have rendered him as well known as he is highly respected.) we have received two copies of a pamphlet entitled "Directions for the rearing of Silk Worms, and the culture of the White Mulberry Tree. Published by the Pennsylvania Society associated for the Promotion of those Objects." Like wise some seeds of the White Mulberry Tree, with directions to give them to one man, who will make a business of rearing the trees—and let him have the profit."

The pamphlet contains 25 pages large octavo, closely printed; and we concluded not to commence reprinting it so near the termination of our present volume. We intend to give extracts, or perhaps the whole pamphlet in the next, or seventh volume of our paper. The white mulberry seed we should be happy to present to any gentleman, who would engage to comply with the above mentioned condition of the donation.

A day or two since, a gentleman arrived in this city, from Detroit, via the Erie canal, with 100 hogsheds of *Tobacco*! It was raised and cured in the Michigan territory; is of a fine quality; and was disposed of in part, at a low rate, but at a fair profit, in this city.

Much attention is now paid in that and other of the Western States and Territories, to the culture of this plant; and the day is, perhaps, not distant, when through the great source of local wealth, (the western canal,) it will find a market at the North.—*Utah Argus*.

How to write a Letter.—Let the writing be so plain that every body can read it, and the meaning be so plain that every body can understand it. Admiral Collingwood, in a letter to his daughter, says that "if pens are bad, they should be mended," and more time is lost in making the apology for great haste, than would have been necessary to finish the letter in good style. These remarks apply with equal force to almost every species of writing.

Thirty thousand silk worms are now in operation at a farm near Baltimore. The worms, with specimens of silk, are shewn gratuitously to the public.

TO FARMERS.

It may not be generally known that the beetle, which frequently commits serious ravages on fruit trees, may be effectually extirpated by shaking them from the trees every evening. By pursuing this course for a few days they will entirely disappear. Being a heavy insect they never wander far, so that there is but little danger of being troubled from the neighboring stocks. We have the above facts from a scientific and practical agriculturist, who says that two painful of beetles were collected on the first experiment; and that afterwards the number regularly decreased until the fifth day, when only two beetles were to be found. The experiment was made two weeks ago, and since that time they have entirely disappeared.—*N. Y. Eve. Post.*

TO ESCAPE THE EFFECTS OF LIGHTNING.

It is particularly dangerous to stand near leaden spouts, iron gates or palisades, at such times; metals of all kinds having so strong an attraction for lightning as frequently to draw it out of the course which it would otherwise have taken.

When in a house, avoid sitting or standing near the window, door, or walls, during a thunder storm. The nearer a person is to the middle of a room, the better.

The greatest evil to be apprehended from lightning, is the explosion of powder-magazines.—These may, in a great degree, be secured from danger by insolation, or by lining the bulk-heads and floorings, with materials of a non-conducting nature, the expense of which would not be great.

Lake Superior.—According to the late surveys of the boundary between the United States and Canada, about one thousand rivers empty themselves into this enormous inland sea. It is estimated that an elevation of nine feet of waters of the lake would cause them to flow over into the source of the Mississippi instead of running in its present direction. An earthquake, such as was experienced at Chili in 1822, might be attended with tremendous consequences to this region of the country.

Revolving rake.—A patent revolving hay and grain rake has lately been introduced into this State, (says the Portsmouth Journal) and considered a highly important and useful invention.—With a horse, one man and a boy, it rakes clean, and by its revolving, discharges the hay into windows without stopping the horse or lifting the rake. It will do as much work as ten or twelve men with hand rakes; and no farmer will dispense with it in gathering his hay and grain after once seeing it in operation.

Farmington canal.—On Friday the 27th instant the first canal boat, called the Jas. Hillhouse, was launched at Farmington, Conn. on the canal at that place, under a salute of artillery, with a band of music, &c. A party of two hundred ladies and gentlemen embarked on board, and were drawn by a team of decorated grays a few miles on the new channel opened to commerce in that direction. They crossed the Farmington river, on an aqueduct thirty-six feet in height, partook of refreshments on the excursion, and returned at sunset, amidst the acclamations of a large concourse of spectators assembled on the rationally joyful occasion.—*N. Y. Statesman.*

Pain in the eyes.—A correspondent at Scituate requests us to publish the following receipt for the cure of severe pains in the eyes: Make a strong decoction of bitter herbs, such as wormwood, tansy, horhound, penny-royal, &c. and hold it, boiling hot, so near the eyes, that the steam will ascend into them. It has been known to give immediate relief in many cases.—And further, he requests us to ask if any remedy is known for weak eyes of ten years' standing?

The Emperor of China, by a late edict, severely enforces his sheriffs for their frequent mistakes in executing one prisoner instead of another, as described in the death warrant, and cautions them against such mistakes in future.

The last number of the North American Review contains articles on the following subjects: Lower Canada—Compagnons of America—Medical Societies—Universities—the Chippewa Indians—the Art of Being Happy—the Red Rover—Notahel Appleton Haven—Necessity of the Common Law—Farrar's Mathematics—Politics of Europe—Epitome of Grecian Antiquities—West's Journals—(Quarterly List of New Publications.

Turnip Seed, &c.

Just received at the New England Farm Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field culture, the White N. rick, White Globe, and Yellow Aberdeen or Bullock are preferable. The Yellow Aberdeen is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, Yellow Ruta Baga, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost vigilance may be taken upon their genuine quality. A variety of Long and Turp. Radishes, suitable for growing the three ensuing months. Precky or Pail Spinach, Long Prickly and Early Cluster Cucumber also the genuine Gurkin Cucumber, or West India pickling one of the best.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it the growth of 1823—to dealers and purchasers by the quantity, it will be put at a low rate.

Also, genuine Powl Meadow Grass from Vermont—Orchard Grass, Lucerne, &c.—Hemp, White Mustard, Flax Seed, &c. At this place is sent the best quality of seeds, native and imported, that art and industry can procure. July 1.

Fresh Oatmeal.

For sale at the New England Farm Seed Store, No. 52 North Market Street, 20 barrels of warranted fresh oatmeal, direct from STEVENS' mills, Barret, Vt. It will be sold by the barrel only, at a low price.

Seeds for the West Indies.

Merchants, masters of vessels and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Fresh Imported Saxony Sheep.

Thursday, July 9, at 9 o'clock, A. M. at Brighton, near Boston, will be sold at Public Auction, the entire flock of Saxony Sheep, imported by Tiro, & Thos. Scarie, in the ship America, Dehis, master, from Bremen, consisting of

72 RAMS, 156 EWES and 14 LAMBS.

Samples of the Wool from each of these Sheep, may be seen at any time previous to the sale, at Samuel Grants, Esq. Walpole, N. H. or at the office of the auctioneers. The whole will be sold on the day above named, without reserve, and none will be disposed of previously, on any terms. Purchasers are all ready so well acquainted with the quality of the Sheep, heretofore imported by the importers of this flock, that it is unnecessary to say any thing more in their favor, than that they will be found equal to any previous importation. Catalogues will be ready for delivery ten days previous, and the Sheep may be examined at Brighton, at any time before the sale.

COOLIDGE, FUR & HICAD, Auctioneers.

Boston, June 26, 1823.
Bremen Geese.
For sale, 10 pair fine Bremen Geese. Apply at the New England Farm Seed Store. July 1.

Barfoot and Scrab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barfoot, a chestnut horse, was as follows:

FOALD B.C.

Barfoot, by Trump, dam Bosanoid by Buzzard, out of Roseberry, sister to Haley and Tartar by Phimonion, out of Miss West by Matchem—Regulus—Cub—Chadders—said.

In 1822, won at Pontreac, sweepstakes of 20 gns. each, for two years old—11 subs.—Barfoot beating Harpocrat.

In 1823, York Springs St. Ledger, of 25 gns. each 6 subs.—Barfoot beating four others—A. Patten of sweepstakes of 30 guineas each for bet. 13 subscribers. Barfoot beating Palatino.

In 1823, the Dunster great St. Ledgers of 25 gns. each, 10 subscribers. Barfoot beating 11 others.

In 1823, at New Market, Barfoot won a handicap plate value £30, beating Trevelian and five others.

In 1824, at Vsect Heath, Barfoot ranked out of the Swin-laws stakes, of 25 sweepstakes each 3 subs.

In 1823, at Lancaster, the gold cup, value 10 gns. added to a sweepstakes of 10 sweepstakes, 17 subs. of all ages. Barfoot beating Lottery and two others.

In 1826, at Manchester, Handicap stakes of 30 sweepstakes each, 10 fl. with 20 sweepstakes added—6 subscribers.—Barfoot beating two others. At Lancaster, the gold cup, value 100 gns. added to a sweepstakes of 10 sweepstakes each 9 subs.—Barfoot beating two others.

SCRAB: (a beautiful bay Horse.) FOALD B. 1821

Got by Phantom out of Jesse, by Totteridge—her dam Cuckoo by Highflyer, out of Nutcracker, by Mateum.

In 1824, won the New Market stakes, 50 gns. each 21 subs.—Scrabs beating four others.

In 1823, at the New York C. Crime meeting, the stakes, 100 sovs. 7 subs. Scrab beating two others. The same year, Spring meeting, Scrab won Handicap sweepstakes, 100 sovs. 6 subs. beating five others.

In 1825, St. John's Keys Plate, 100 gns. beating 30 others.

In 1827, Boston, Scrab won the gold cup. J. J.

MISCELLANIES.

AGRICULTURE.

Thou first of arts, source of domestic ease,
Pride of the land, and patron of the seas,
Thrift Agriculture! lend thy potent aid;
Spread thy green fields where dreary forests shade:
Where savage men pursue their savage prey,
Let the white flocks in verdant pastures play;
From the bloom'd orchard and the showery vale
Give the rich fragrance to the gentle gale;
Reward with ample boon the laborer's hand,
And pour thy gladdening bounties o'er the land
Columbia's sons, spurn not the rug-ed toil;
Your nation's glory is a cultur'd soil.
Rome's Cincinnatus, of illustrious birth,
Increased his laurels whilst he till'd the earth
Even China's Monarch lays his sceptre down,
Nor deems the task unworthy of the crown.

Reasons for emigrating.—A Scottish gentleman in the warmth of national veneration, was praising Scotland for the cheapness of provisions; a salmon might be bought for sixpence, and a dozen mackerel for twopence. "And pray, sir," said one of the listeners, "how came you to leave so cheap a country?"—"In gude troth, mon," replied the Scotchman, "although fish is plentiful enough, the sixpence and twopence are uncoversed."

In old times it is said a parishioner thought himself cheated if a sermon were less than an hour long. Now, short sermons are called for.

A farmer hired a man to break flax by the day, and he said he could hear all day long the slow sound. By—the—d-a-y—By—the—d-a-y—By—the—d-a-y. He afterwards hired him by the job; the music was then changed to double quick time—By the job, By the job, By the job, job, job.

The clerk of a church in England lately gave notice of a parish rate in the following manner: "I am desired to give notice that the third rate is assessed five pence in the pound," and without pausing, added, "let us sing to the praise and glory of God,

"Lord what a wretched land this is,
That yields us no supplies."

Longevity.—There are 17 men now living in New Haven, whose united ages amount to 1413 years. The average of each individual is eighty-three years. In addition to these, there are twenty-seven men, whose united ages amount to 1871 years, and whose average age is 73 years. The average age of the two together is about seventy-seven years.

Eggs, Rags, and Rum.—A few days since, as I was journeying back from the sea-board, I called at a store in ——— to bait my horse. While I was waiting for the wearied animal to take his allowance, there came in a squalid looking woman, and passing to the counter, in a low voice inquired of the clerk—'Have you any rum?' She was answered agreeably to her wish. 'Give me a quart,' said she, handing him a jug, and at the same time beginning to lay out upon the counter from a covered basket, the *quid pro quo*.—'There are nine of your eggs,' said the clerk. 'Here are some paper rags also,' said she of the brown jug. They were thrown into the scales, and raised a twelve ounce weight. 'You have $\frac{3}{4}$ of a pound,' said the clerk. 'The eggs and the rags come to nine cents—the rum is ten.'

By this time the fire in my bones began to burn. Rising from my seat, I said, 'Good woman, have you a family?' 'No,' was her reply, and, as if conscience was beginning to do its office, she added, 'I haven't got it for myself.'

The sequel I will not relate, only that I went on my way thinking on the *power of appetite*. This woman had been picking up a rag here and a rag there—and had been anxiously watching her hen for nine successive days. And for what? For the means of gratifying a raging and an unconquerable appetite. These are thy triumphs, O rum!

Should this little incident, Mr. Editor, make the same impression on your mind as it did on mine, you will throw it into some corner of your useful paper.

"Forty."—A writer in the Athenaeum, under the head "Biblical Criticism," has some curious observations on the word "forty," as used in the Scriptures. He observes that this numeral, which occurs so frequently, and in places where its introduction is manifestly at variance with the passages that precede and follow it, is in the East, constantly used as a general term, implying "many" or indefinite numbers, as we use the words "score," and "dozen or two." A ruined palace at Persepolis is called "Cselmininar," or the "forty pillars," though it has but 19 standing, and when perfect had 260. The Arabs also use one thousand and one in a similar manner. Thus Moses was in the Mount "forty" days, means many, not "forty" years in the wilderness. This meaning explains numerous difficulties in Scripture history. And Persians, Arabs, and Turks, still use the term "forty" in this case.

The Militia.—A correspondent in the Lowell Journal, signed "8000," thus notices the militia system: "Of all the laws of the present day, there is none that operates so unequally on all, and so large portion of society as does the present *odious militia system*. It is also very injurious to the welfare of society—induces idleness, drinking and many other vices. It is a tax on the rich man's purse, and a tax on the poor man's time. If the sum of money is to be got rid of, we say apply it to some nobler object. In vain may we build churches, have prayer meetings, form societies for suppression of intemperance, &c. &c. We say in vain may we do these things unless we abolish entirely the militia system. No man has ever yet shown that the country has been benefited, by these trainings. The system has none other for its advocates, except those who are, like children, "pleased with a rattle, tickled with a straw" who admire to strut about dressed in regiments, and to exhibit themselves to the gaze of the public, to show to the world how much braver they appear in times of peace, than they would in time of war. We are far behind our southern friends in this business. In Maryland, of so little consequence is it, that, by paying two dollars you are exempt, any body old or young for the year. Every one ought to read the Rev. Mr. Pierpont's sermon before the Ancient and Honorable Artillery, on the Election day, 1825. It shows the militia system in its proper light.—The supporters of the system are decreasing every day and it must ere long go down—down—never to rise again.—*Salem Observer.*

It is said Lee has been ordered to be admitted free of duty at Cuba for two years.

India rubber has been successfully used in England for hose for engines. A certificate, in its favor, is published by a man who had 126 feet in constant use two years. It answered the purpose completely, and was decidedly preferable to leather hose. It required no care, no oiling, and being always perfectly air tight, it is vastly superior for suction hose.

The Saco Palladium states that the mill erected by the Saco Manufacturing Company, will contain 12,000 spindles and 360 looms. 1200 spindles have been started within a few weeks, and a proportionate number of looms.

Bluminated church dials are becoming numerous in London, and are found very convenient to the public.

For Sale,

At the Agricultural Warehouse 100 Doz. of Derby's patent Best Rakes—Perseus's Rakes, Furrow and other best warranted Scythes—Megregy's and Hall's best warranted hay rakes—Willis's Improved Horse Power Machine—Pope's Hand Threshing Machine, &c.

Cucumber Seed, &c.

Just received at the New England Farmer Seed Store, a further supply of Green and White Turkey, White Spined, Long Pickle, and small West India Green Cucumber Seed—the latter is a fine sort for pickling, and should be planted soon.

For Sale,

At the New England Farmer Seed Store, "A Memoir of the Cultivation of the Vine in America—and the best Mode of making Wine. Second Edition. By John Adlam. June 27

Field Beans.

For sale at the New England Farmer Seed Store two barrels of small white prolific Field Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and are all of the growth of 1827.

Gunpowder, &c.

Du Pont's Gun Powder, at 25 to 30 cts per pound—Shot—Ball—Flint and Percussion Caps.

Also, Alum—Refined Salt Petre—Blue Vitriol, &c. constantly for sale at the *Dipont Powder Store*, No. 65 Broad Street—By E. COPELAND, Jr.

By the Du Pont sold as above, is warranted first quality—and is marked "E. Copeland, jr. Boston," on the head of the cask. March 14

MILLET.

Just received at the New England Farmer Seed Store, 50 bushels of Millet of superior quality. gentlemen in want of this article are requested to call and examine it.

Also, a further supply of Orchard Grass, Luterne, Fowl Meadow, Mangel Wurtzel, Sugar Beet, Rata Buga, Russian Flax, Lima Beans, &c. with several new varieties of Turnip Seed from Europe, including the Yellow Malta, Yellow Stone, Yellow Aberdeen, &c. A few barrels fresh White Mustard Seed.—Also, Green Citron, Pine Apple, and Pomegranate Musk Melons; Carolina and Long Island Water Melons.
For sale at the New England Farmer Seed Store, a few pounds of Long White Summer Naples Radish, a variety highly esteemed in the Southern States.

Bull Belvoir.

The high bred imported Improved Short-horned Bull Belvoir, will stand at the subscriber's stable in Charlestown, Mass. Price \$5 for each cow for the season. This bull was selected by Mr. Coates, the keeper of the Herald Book, without limitation of cost, for the use of the Powelton stock, and is so highly valued by Col. Powel, that he has always refused to sell him, and has consented to part from him but for a season, considering him in form, points, and pedigree, equal to any animal to be had in Great Britain.

Belvoir is red and white, is not three years old, and has never been forced yet he gets immediately behind his fore legs 5 feet 3 inches. The singular neatness of his shoulder, the straightness of his back, the width of his loin, the smallness of his head, neck, and ossil, the quickness of his gait, together with the well known character of his family as dairy stock, render him one of the most desirable males for improving our neat cattle, that can in any country be found.

SAMUEL JAQUES, Jr.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscription are entitled to a deduction of fifty cents.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

No. 51.

DOMESTIC ECONOMY.

From the Boston Daily Advertiser.

Although the means of preventing and destroying putrid or infectious miasmata, by the use of chemical agents, have been long known, they have been resorted to for the most part only on occasions of alarm. They may be made to conduce so much to our comfort and health at this season, that I venture to send you a brief notice of a preventive and remedial agent, which may be employed in any situation, and under all circumstances.

Within a few months great use has been made in France of a chemical compound of chlorine gas and lime or soda, for the purpose of destroying the offensive odours arising from putrifying animal and vegetable matters. The first use of this compound was in a case of judicial inquiry, where it became necessary to dis-infer a body for examination, and by it the effluvia was destroyed in an hour or two.

For all common purposes, the effects of the compound of lime and chlorine, known in commerce as "bleaching powder," and "bleaching salts," are similar to those of the substance used in France under the name of "Labarraque's Disinfecting Soda Liquid."

The bleaching powder may be sprinkled about an apartment, or a small quantity thrown into a vessel which it is desirable to purify; or it may be dissolved in water, and cloths be dipped in the solution, and afterwards be brought into the vitiated atmosphere. Vehicles for the removal of offensive substances, as well as the substances themselves, may be freed from all offensive odour by the use of the powder, while at the same time the fertilizing powers of those substances are remarkably increased—a fact which has been established by actual experiment.

In some situations and apartments, a few spoonfuls of the powder may be mixed with the sand with which the floors are usually sprinkled. The many occasions, both in public and private, where this purifying agent may be advantageously employed, must be obvious.* It is sometimes desirable to prevent the rapid change of a dead body previous to interment; this would be accomplished by a small quantity of the dry powder under the coffin, or by the application of the moistened clothes.

In descending into vaults, pits, sewers, &c. if the air breathed be passed through a sponge which has been wet with the solution, the person can remain some time without injury in situations where others not so provided would infallibly be destroyed.

The use of this substance in the sick chamber will be found a source of no slight comfort, and even safety in some diseases; and it has been applied to ulcers and putrescent sores with manifest advantage.

The effect of this chemical agent is not like

* We recommend this excellent article to the attention of those engaged in removing *night soil*; and particularly to such farmers in Brookline, Brighton, &c., as lime is deposited on their farms. The "Bleaching Salts" alluded to, can be purchased at the New England Farmer's seed store in any quantity.

that of vinegar, and the various substances resorted to on occasions like the above, it does not merely disguise the odour, it chemically decomposes and destroys it. It is perfectly innocent, and not expensive, unless purchased in small quantities usually sold in small tin boxes; it should be obtained from the manufacturer, by the pound.

Cambridge, July 1. J. W. WEBSTER.

From "Seventy-five Receipts for Pastries, Cakes, Puddings," &c., an excellent treatise published by Mearns & Francis, and for sale at this office, price 50 cents.

GOOSEBERRY PUDDING.

A pint of stewed gooseberries, with all their juice.
A quarter of a pound of powdered sugar.
Two ounces of fresh butter.
Two ounces of grated bread.
Three eggs.

Stew the gooseberries till quite soft. When they are cold, mash them fine with the back of a spoon, and stir into them two ounces of sugar.—Take two ounces more of sugar, and stir it to a cream with two ounces of butter.

Grate very fine, as much stale bread as will weigh two ounces.

Beat three eggs, and stir them into the butter and sugar in turn with the gooseberries, and bread.

Lay puff-paste in a soup-plate. Put in the mixture, and bake it half an hour.

Do not grate sugar over it.

BLACK CURRANT JELLY.

Pick the currants from the stalks, wash and drain them. Mash them soft with a spoon, put them in a bag, and squeeze out the juice. To each pint of juice, allow three quarters of a pound of loaf-sugar. Put the juice and sugar into a preserving kettle, and boil them about ten minutes, skimming them well. Take it immediately out of the kettle. Put it warm into your glasses. Tie it up with brandy papers.

The juice of black currants is so very thick, that it requires less sugar and less boiling than any other jelly.

FRUIT PIES

Fruit pies for family use, are generally made with common paste, allowing three quarters of a pound of butter to a pound and a half of flour.

Peaches and plums, for pies, should be cut in half, and the stones taken out. Cherries also should be stoned, and red cherries only should be used for pies.

Apples should be cut into very thin slices, and are very much improved by a little lemon-peel.—Sweet apples are not good for pies, as they are very insipid when baked, and seldom get thoroughly done. If green apples are used, they should first be stewed in as little water as possible, and made very sweet.

Apples, stewed previous to baking, should not be done till they break, but only till they are tender. They should then be drained in a colander and chopped fine with a knife or the edge of a spoon.

In making pies of juicy fruit, it is a good way to set a small tea-cup on the bottom crust, and lay the fruit all around it. The juice will collect under the cup, and not run out at the edges or top of the pie. The fruit should be mixed with a suf-

ficient quantity of sugar, and piled up in the middle, so as to make the pie highest in the centre.—The upper crust should be pricked with a fork, or have a slit cut in the middle. The edges should be nicely crimped with a knife.

Dried peaches, dried apples, and cranberries should be stewed with a very little water, and allowed to get quite cold before they are put into the pie. If stewed fruit is put in warm, it will make the paste heavy.

If your pies are made in the form of shells, or without lids, the fruit should always be stewed first, or it will not be sufficiently done, as the shells (which should be of puff-paste) must not bake so long as covered pies.

Shells intended for sweetmeats, must be baked empty, and the fruit put into them before they go to the table.

Fruit pies with lids, should have loaf-sugar grated over them. If they have been baked the day before, they should be warmed in the stove, or near the fire, before they are sent to table, to soften the crust and make them fresh.

Raspberry and apple pies are much improved by taking off the lid, and pouring in a little cream just before they go to table. Replace the lid very carefully.

RED CURRANT JELLY.

Wash your currants, drain them, and pick them from the stalks. Mash them with the back of a spoon. Put them in a jelly-bag, and squeeze it till all the juice is pressed out.

To every pint of juice, allow a pound of the best loaf-sugar. Put the juice and the sugar into your kettle, and boil it fifteen minutes, skimming it all the while. Pour it warm into your glasses, set it for several hours in the sun, and when cold, tie it up with brandy paper. Jellies should never be allowed to get cold in the kettle. If boiled too long, they will lose their flavour, and become of a dark colour.

Strawberry, raspberry, blackberry, and grape jelly may be made in the same manner, and with the same proportion of loaf-sugar.

Red currant jelly may also be made in a very simple manner, by putting the currants whole into the kettle, with the sugar; allowing a pound of sugar to a pound of currants. Boil them together fifteen minutes, skimming carefully. The currants into a sieve, with a pan under it. Let them drain through the sieve into the pan, pressing them down with the back of a spoon.

Take the jelly, while warm, out of the pan and put it into your glasses. Tie it up with brandy paper when cold.

Lusus Nature.—A Royal George peach tree, cultivated in the garden of the Rev. Mr. Howman of Beccles, produced, last season, rather a large fruit, three parts of which were peach, and one part *nectarine*, quite distinct in appearance as well as in flavour.—*Gardener's Magazine.*

Mr. Andrew Hook, No. 165 Market street, Baltimore, has prepared handkerchiefs from India silk, with views of the Baltimore and Ohio Railroad elegantly printed on them.

MOWING.

They who have not been in their youth accustomed to do this work, are seldom found to be able to do it with ease or expedition. But when the art is once learnt, it will not be lost.

As this is one of the most laborious parts of the husbandman's calling, and the more fatiguing as it must be performed in the hottest season of the year, every precaution ought to be used which tends to lighten the labour. To this it will conduce not a little, for the mower to rise very early, and be at his work before the rising of the sun.— He may easily perform half the usual day's work before nine in the morning. His work will not only be made easier by the coolness of the morning air, but also by the dew on the grass, which is cut the more easily for being wet. By this means he may lie still and rest himself during all the hottest of the day, while others who began late are sweating themselves excessively; and hurting their health, probably, by taking down large draughts of cold drink to slake their raging thirst. The other half of his work may be performed after three or four o'clock; and at night he will find himself free from fatigue.

If the mower would husband his strength to advantage, he should take care to have his scythe, and all the apparatus for mowing, in the best order. His scythe ought to be adapted to the surface on which he mows. If the surface be level and free from obstacles, the scythe may be long and almost straight; and he will perform his work with less labour, and greater expedition. But if the surface be uneven, cradled, or chequered with stones, or stumps of trees, his scythe must be short and crooked. Otherwise he will be obliged to leave much of the grass uncut, or use more labor in cutting it. A long and straight scythe will only cut off the tops of the grass in hollows.

A mower should not have a snead that is too slender; for this will keep the scythe in a continual tremor, and do much to hinder its cutting.— He must see that it keeps perfectly fast on the snead; for the least degree of looseness will oblige him to use the more violence at every stroke.— Many worry themselves needlessly by not attending to this circumstance.

Mowing with a company ought to be avoided by those who are not very strong, or who are little used to the business, or who have not their tools in the best order. Young lads, who are ambitious to be thought good mowers, often find themselves much hurt by mowing in company.

Mowers should not follow too closely after each other: For this has been the occasion of fatal wounds. And when the dangerous tool is carried from place to place, it should be bound up with a cope of grass, or otherwise carefully secured.

Mr. de Lisle introduced in England, the mowing of wheat. The method is this: The scythe he uses is at least six inches shorter in the blade than the common scythe; and instead of a cradle, has two twigs of osier put semi-circular wise into holes made in the handle of the scythe, near the blade, in such a manner that one semi-circle intersects the other.

By this method of mowing wheat, the standing corn is always at the left hand. The mower mows it inward, bearing the corn he cuts on his scythe, till it come to that which is standing, against which it gently leans. After every mower follows, a gatherer, who being provided with a hook or stick, about two feet long, gathers up the

corn, makes it into a gavel, and lays it gently on the ground. This must be done with spirit, as another mower immediately follows.—*Com. Farm.*

As reaping is slow and laborious work, it would be right for our countrymen to learn this method of mowing their wheat; which will undoubtedly answer also for other sorts of grain.—*Deane.*

Soap, saving of.—For the use of private families, where linen is dirty by perspiration or grease it will be of great service towards rendering it white, to steep it for some time in a clear liquor, made by mixing one quart of quick lime in ten gallons of water, letting the mixture stand 24 hours, and then using the clear water, drawn from the lime. After the linen is steeped in this liquor it should be washed as usual, but it will require much less soap to be used.

KITCHEN GARDEN—JULY.

Several successional crops are required to be sown this month for the supply of autumn, and some main crops for winter consumption. Many principal crops will be now arrived to full perfection, and some mature crops all gathered. When the latter is the case, the ground should be cleared and dug for succeeding ones, or for some general autumn and winter crops, as turnips, cabbages, savoy, brocoli, cauliflowers, celery, endive, &c. &c.

The business of sowing and planting this month will be more successful if done in moist or showery weather, or on the approach of rain, or immediately after; especially for small seeds, and young seedling plants.

Old crops of artichokes now advancing in full fruit should be diversified of some of the small side heads, to encourage the principal top heads in attaining a larger magnitude.

Now is the time to gather aromatic herbs for drying and distilling, &c. as spear-mint, peppermint, balm, penny-royal, camomile flowers, lavender-flowers, sage, hyssop, marjoram, fennel, dill, basil, tarragon, angelica, marigold flowers, sweet-marjoram, &c. most of which, when just coming into flower, are in the best perfection for gathering. The fennel, dill, and angelica, should remain till they are in seed.

Plant the last crops of beans, for late production in autumn. Let them be principally of the smaller kind, as they are most successful in late planting, putting in a few at two or three different times in the month; and also some larger kinds, to have the greater chance of success and variety; and in all of which, if dry weather, soak the beans in soft water, six or eight hours, then plant them, and water the ground along the rows.

Earth up celery plants, to blanch; also the stems of young cabbages, savoy, brocoli, borecole, beans, peas, kidney-beans, &c. to strengthen their growth.

Sow the principal late crops of kidney-beans, of the dwarf kinds, for autumn supply; and some more for late successional production in September, &c. sow them all in drills, two feet or two feet and a half distant; and if the weather is very hot and dry, either soak the beans, or water the drills well before you sow them.

Continue to plant out different sorts of lettuce at a foot or fifteen inches from each other. Plant them in small shallow drills, to preserve the moisture longer; and water them well at planting.

If your melons are advanced to full growth,

give them but little water, as much moisture will retard the ripening, and prevent their acquiring that rich flavor peculiar to this fruit. If they are ripe gather them in the morning. Mature ripeness is sometimes shewn by the fruit cracking at the base round the stalk, or by changing yellowish, and imparting a fragrant odour.

Radishes may be sowed for an autumn crop to draw next month.

LONDON PORTER.

This popular beverage would seem, from the statements made of its ingredients, very ill to deserve its renown. The proportion of the malt consumed to the porter made, shows that if malt and hops alone were used, the liquor produced would not be so intoxicating as the most water small beer. Its intoxicating property must arise, therefore, from some other ingredients. What is called "porter essence" is the most in use for this purpose. The following is said to be the recipe for this agreeable and highly salutary compound:

Take $\frac{1}{4}$ cwt. of Spanish liquorice, and 4 lbs. of copperas, boil them together in a copper pan, in 3 gallons of water. Then take $\frac{1}{2}$ cwt. of molasses or treacle, and $\frac{1}{2}$ cwt. of raw sugar, and boil them till they thicken a good deal, add the mixture above mentioned, and boil altogether two hours. When cold, add the following ingredients, in powder, 4 lbs. of gentian root, (ground) 4 lbs. of orange-peel, 2 lbs. of ground calamus root, and stir and mix till the substance becomes like a soft extract."

Other ingredients are used, such as *quassia*, the *mullein powder*, as it is called, to save hops, the *cochulus indicus*, and *nux vomica*, which are in the highest degree destructive to animal life, though their immediate effect is only a kind of stupid intoxication. More than 30,000 lbs. of *nux vomica*, and more than 12,000 lbs. of *cochulus indicus*, are annually imported into Great Britain. As the only other use for these drugs, besides their infusion into porter, is to poison vermin, it is naturally concluded that nearly the whole goes into the porter, for the purpose of poisoning men. It is this delectable beverage which gives London porters that inflammatory habit and red complexion which are mistaken for health, but which rather betokens so much solidified hydrogen, ready to take fire at every moment. It is a problem for the curious, which is the more effectual and honorable means of extinguishing life—English porter or American whiskey.—*Baltimore American.*

Soda, in washing.—A few ounces of soda will soften a hog'shead of the hardest water. It is said to be greatly superior in washing to either potash or pearlash. It gives a delicate whiteness to the linen without the slightest injury, and never unless excess is used in the least affects the hands. To glasses, decanters, table spoons, &c. it gives a lustre equal to the highest polish, without labour, if washed in water, in which a small quantity has been dissolved.

The Georgia (Augusta) Courier of the 23d ult. says that on the previous Saturday there were 14 cart and wagon loads of Watermelons in market which is considered unusually early.

Several instances have occurred recently, in Connecticut, of dairy women having the King Pock, caught from the cows.

GRAPE VINES.

Communication from William Wilson, Esq. of Clermont, New York, on the culture of the Grape. Addressed to the New York Horticultural Society, March 1821.—Communicated for the New York Farmer.

You noticed a few grapes which I sent last summer to my friend, Mr. Peter Hattack—they were not intended for exhibition, or perhaps better bunches might have been sent. But as they met your approbation, the mode of raising them may not be unacceptable. I have cultivated grapes for more than twenty years, and for the last ten years with success. The soil in which they grow, is a light gravelly loam, the ground perfectly level, the vines were raised from cuttings and planted in the place they were intended to be continued, and where they now are. I have two rows of about twenty-five vines each, one on the north side of the garden, exposed to the south and protected by a high board fence, the other row in the middle and most exposed situation, with no shelter whatever. For the first six or seven years, they were cultivated in the usual way, cut down to three or four feet, and supported by stakes and laths. Their growth was rapid, and required a good deal of trimming. They bore fruit: but in two years out of three, they were blasted and mildewed, good for nothing; all we got was trouble and vexation. I had resolved to abandon them. About this time, I observed in the woods some very fine looking wild grapes, the vines running up high trees, and most of the fruit at or near the top. On examining, many were found in the same situation; from this I took the hint of raising the cultivated grape higher from the ground. At the time of trimming I left the vines their whole length, ten or twelve feet or more; cutting away every side shoot and leaving the vines as clear of shoots, or spurs, or beads, as possible. The spring following, by every vine was fixed a strong stake at least ten feet high, with most of the limbs untouched, so that they had the appearance of large bushes, or well grown saplings. The vines were twisted around them to the top, and when necessary, tied with bass.—By the middle of June, the stakes were entirely covered by the new shoots of the vine, and with plenty of fruit, which was fully ripe in September, and not one bunch blasted or mildewed; there was not one cluster within three or four feet of the ground. Since that time I have continued the same practice, and have now vines 20 or 30 feet long; some of which run up the fruit trees adjoining, the others being carried up 8 or 10 feet, and then stretched horizontally. It is no unpleasant thing to see a cherry tree on one hand, a pear tree on the other, and a peach tree not far off, all ornamented with clusters of grapes. Yet such is the case, and has been for years past.—Several strangers, both citizens and Europeans, curious in such things, have called to examine for themselves, and have generally allowed it to be the most successful cultivation they had seen.

To the members of the horticultural society, who, it is probable are mostly practical men, I cannot write in their technical language; it is therefore hoped they will excuse the inaccuracies that occur. In as few words as possible, the whole management of the year is as follows, and it matters not at what period we begin. The fruit begins to ripen early in September and continues till the frosts in October. As soon as the grapes are all gathered, that is about the 15th of

October, the stakes are taken up and thrown aside for fire wood. The vine is then stretched out its whole length and trimmed as clean as possible, in which state it is left lying on the ground for two or three weeks; about the last of November, they are laid on the surface at full length, and fastened down with pins, and covered lightly with earth; which is done by digging a shallow ditch on each side, and throwing up the ground to the middle, which forms a ridge over the vines, and covers them about ten or twelve inches; no straw, manure, or any other covering but the earth; in this state they lie all winter. In April, as soon as the weather will permit, they are uncovered and left on the ground for ten or twelve days or more; the stakes are now, about the first of May, fixed in their places, and the vines replaced as before. They require no farther trouble, unless some that may be blown down are to be put up again. The borders are now well dressed by digging and raking, but no manure, nor has any been put on for ten years or more. They are also kept perfectly clean through the summer, by frequent hoeing and raking; no vegetables are allowed to grow on the borders at any time.

This mode of raising grapes differs from the ordinary in these particulars:

1st. Trimming or pruning; this is usually done in February or March. Here we never cut a vine later than November; were this done in the spring they would either bleed to death or be so much weakened as to bear no fruit. In general, we are too sparing of the knife, leaving too many eyes or buds, by which you get too much wood and too little fruit; and there is a mistake, which all writers that I have seen have fallen into, that "vines bear their fruit on the wood that was produced the preceding year." This is not the case, for the fruit is invariably on the wood of the present year.

2d. The next difference is laying down and covering the vines all winter. In our northern climate, this is absolutely necessary; it may not be so farther south, yet it is worth a trial with a few vines. Prune in October, lay them down and cover in November or December, and take them up in March. One season will test the utility or futility of the practice.

3d. Another difference is leaving the vine its full length and training it as high as possible.—This I have never seen except in my own garden; but it is the practice in some parts of Italy, where the vines run over the poplar and elm trees.

4th. Most people plant their vines in sheltered and warm places; this is following the English mode, where the climate requires it. Here my vines that are most exposed, bear equally if not better than others.

5th. No manure has been used for many years. Its use gives wood, not fruit.

The greater part of the grapes are the sweet water; these are the best bearers, and pleasanter for table. The miller grape answers well for a variety, and is a good bearer. I have tried the red and black Hamburg, but they do not succeed so well. I am now trying to raise the Madeira grape, having received a few cuttings, which came from that island, last spring, all of which are growing and shall have a fair trial.

The borders on which the grapes are cultivated are six feet wide, and the vines in the centre.

Your humble servant,

Clermont, N. Y. WILLIAM WILSON.

From Memoirs of the Caledonian Horticultural Society.

TREATMENT OF GOOSEBERRY BUSHES.

As soon as the leaves are all fallen, I begin pruning and dunging, if need require. I then dig the ground between the bushes, leaving the ground as rough as possible; and as the diggers are proceeding, that is, as soon as they are clear of the first plant in the row, I give the bush, from the rose of a watering-pot, at least an English gallon of the following mixture, of equal parts, viz. lime-water, chamber-ley, and soap-suds, in which I introduce as much soot as to give the composition the color and consistence of rich dunghill drainings; proceeding over the whole in this manner, without treading or poaching the ground: in which state they remain until the winter frosts are fairly past, when I level and dress up the ground between with a rake.

This practice I have invariably performed, and have always had healthy fruitful bushes, and never in the least annoyed with any insects on the bushes so dressed. JOHN NAISMITH.

HOW TO PICKLE WALNUTS.

Scald slightly, and rub off the first skin of a hundred large walnuts, before they have a hard shell: this may easily be ascertained by trying them with a pin. Put them in a strong cold brine, put new brine the third and sixth days, and take them out and dry them on the ninth. Take an ounce each of long pepper, black pepper, ginger, and allspice; a quarter of an ounce of cloves, some blades of mace, and a table-spoonful of mustard-seeds: bruise the whole together, put into a jar a layer of walnuts, strew them well over with the mixture, and proceed in the same manner till all are covered. Then boil three quarts of white wine vinegar, with sliced horse-radish and ginger, pour it hot over the walnuts, and cover close.—Repeat the boiling of the vinegar and pour it hot over, three or four days, always keeping the pickle closely covered; add at the last boiling a few cloves of garlic, or shallots. In five months they will be fit for use.

A Tropical Climate.—Insects are the curse of tropical climates. The vete rouge lays the foundation of a tremendous ulcer. In a moment you are covered with ticks. Chigoes bury themselves in your flesh, and hatch a large colony of young chigoes in a few hours. They will not live together, but every chigoe sets up a separate ulcer, and has his own private pus. Flies get entry into your mouth, into your eyes, into your nose. You eat flies, drink flies, and breathe flies. Lizards, cockatrices, and snakes, get into the bed—ants eat the books—scorpions sting you on the foot—every thing stings, bites, or bruises—every second of your existence you are wounded by some piece of animal life, that nobody has ever seen before, except Swammerdam and Mariam. An insect with eleven legs is swimming in your tea cup—a non descript with nine wings is struggling in the small beer, or a caterpillar with several dozen eyes in his belly is hastening over the bread and butter! All nature is alive, and seems to be gathering her entomological hosts to eat you up as you are standing, out of your coat, waist-coat and breeches. Such are the tropics. All this recollects us to our dews, fogs, vapor and drizzle—to our apothecaries rushing about with gargles and tinctures—to our British constitutional coughs, sore throats, and swelled faces.—*Edinb. Review.*

Extracts from Knight's Treatise on the Culture of the Apple and Pear.

The inexperienced planter will suppose that much time will be lost in propagating new kinds, as these will not produce fruit so soon as grafts of those which have been long in cultivation; but he will soon find that the fruit of very small young trees by no means repays him for the injury they sustain in growth. If the seeds, from which new varieties were expected, and those intended merely to produce stocks, were sowed in the same season, the merits of those varieties would generally be known, as early as the stocks would have gained proper size and strength in the nursery, and have become after being moved, firmly rooted in the ground, where they are to remain; and if the stocks were then to be grafted in the branches, with those new varieties, I know no means by which an orchard could be better, or more expeditiously raised.

It has been recommended to remove the young trees once or twice during the time they remain in the nursery, under the idea of increasing the number of their roots; but I think this practice only eligible with trees which do not readily grow when transplanted. I have always found the growth of young apple trees to be much retarded, and a premature disposition to blossom to be brought on by it, and I could not afterwards observe that those trees, which had been twice removed, grew better than others. It has also been supposed that many small roots, proceeding immediately from the trunk, are in the future growth of the tree to be preferred to a few which are large; but as the large roots of necessity branch into small, which consequently extend into a greater distance, the advantages of more transplantations than from the seed-bed to the nursery, and thence to the orchard, may reasonably be questioned.

The apple tree succeeds best in situations which are neither high, nor remarkably low. In the former its blossoms are frequently injured by cold winds, and in the latter by spring frosts, particularly when the trees are planted in the lowest part of a confined valley. A south, or southeast aspect is generally preferred, on account of the turbulence of the west, and the coldness of the north winds; but orchards succeed well in all aspects; and where the violence of the west wind is broken by an intervening piece of ground, a southwest aspect will be found equal to any. The trees attain their largest stature in a deep strong loam; but will grow well in all rich soils, which are neither excessively sandy nor wet. An orchard, generally, is most productive of fruit, when it is situated near the fold-yard, and is in consequence much trodden and manured by the cattle in the winter; and hence it will not unfrequently be found advantageous to plant on the site of an old orchard. The ground, however, in which old apple trees have grown, is esteemed very unfavorable to young ones. When from contiguity to the house, an orchard is planted in this kind of ground, the pear and apple should be made to succeed each other, as has been judiciously recommended by Mr. Marshall. The roots of the pear descend to a greater depth in the ground than those of the apple tree; and as the stocks of neither of these fruits will afford proper nutriment to the other, it may be questioned whether their action on the soil be perfectly similar.

In the choice of fruits of every situation, atten-

tion should be paid to select such as are sufficiently early to ripen well in it; for if the fruit be not ripe, its produce must ever be crude, harsh or unpalatable. A cider apple may be safely pronounced to be too late for the situation it occupies, when it does not become yellow before the end of October; and I do not know any disadvantages attending a more early maturity; provided the kinds of fruit be capable of being kept a few weeks. An opinion, I have observed, prevails that the liquors obtained from all early fruits are without strength or body; but the strongest cider, yet known, is produced by one of these, the *Stire*; and I have met with two other varieties, evidently capable of making extremely strong ciders, which ripens in the end of August.

In cold and unfavorable situations those fruits will best repay the planter, which in their general character appear nearly related to the native kind or crab; for though the flavor of these be austere and ungrateful to the palate, the ciders produced from some of them, when they have been thoroughly ripened, are often found smooth and generous. I would recommend the grafts to be taken from an improved crab, in preference to the degenerated apple; for the former will possess much of the hardness and vigor, whilst the latter will often inherit the debility and diseases of the parent tree. Proper fruits of this kind might probably be obtained from a crab of a deep yellow color, and in taste rather astringent than acid, trained to a south wall, and impregnated with the farina of a rich early apple, in the manner already recommended. But both the red, and the yellow Siberian crabs possess qualities, which appear to give them great advantages over every English variety. Their blossoms are in an extraordinary degree, capable of bearing cold; the fruit attains a very perfect and early maturity; it is in color and beauty unrivalled, and contains but a moderate portion of acid, compared with its astringency.

I am well satisfied that the fruits, I have obtained from these, will flourish and make fine ciders in many situations where kinds which have been more improved by cultivation will not succeed; and when old trees, whose branches have been taken off, are to be engrafted, I have no doubt but that fruits of this kind, just arrived at the bearing age, may be used with very great advantage. The leaf and habit of an improved crab will generally indicate a worse fruit, and of a degenerate apple a better, than the trees will afterwards produce; but this remark does not appear to me to be applicable to those fruits, whose degeneracy, or variation, has been produced by the introduction of the farina of another kind.

GRAFTING AND INOCULATION.

It is not unreasonable to suppose that the benefits to be derived from the engrafting and inoculation of fruit trees, are far from being fully realized. Aside from the neglect of improving orchards, where there is nothing to prevent but the disposition to procrastinate and delay—so prevalent with all—we believe that the process is of much more extensive application than is generally known, and that it may be the means of introducing the cultivation of fruits, now imported from abroad at a great expense. It has been ascertained that the shag-bark walnut may be successfully engrafted, and that the engrafted trees are much the surest bearers. Where this is not the case, the difference in the quality of these nuts

would make it an object to engraft most of the walnut trees. Some have a very thin shell, and a thick, large meat—while others have a thick shell and but little meat. It is probable that the hickory, or shag-bark, would do well, engrafted on the pig-nut. If it should, the quantity raised might be greatly increased, and the quality much improved. The Madera nut, which is usually sold at the shops under the name of the English walnut, at 12 $\frac{1}{2}$ to 16 cents per pound, may be cultivated here without difficulty, and is very productive. In the vicinity of New York, there is a tree which has produced, in a single year, as many as sold in the market for two hundred dollars. We have no doubt that it might be engrafted on the butter-nut, or the walnut, with perfect success. It is a tree of the same genus, and in its character bears a nearer resemblance to the butter-nut than many other trees do to those on which they are successfully engrafted. The experiment is worth trying, and, if successful, it would soon furnish us, at a cheap rate, with a good supply of that excellent nut, without waiting the more tardy process of rearing the tree.—*Mass. Spy.*

GREEN FRUIT.

It may not be amiss to remind parents, and all those who have the immediate oversight of children, that unripe fruit already begins to appear in our markets. It is possible that more children's lives are destroyed, in the summer, by this cause of disease, than almost all others put together.—Apples which are shaken from the trees by violent winds, or fall prematurely by decay, are immediately gathered and brought to market; the display of them is too tempting to children to be withstood; and of course, they are purchased, and eaten. Nothing is more pernicious, and yet nothing is more common, than to see children and young persons eating this kind of fruit. We should think that parents would lay a more strict injunction against this indulgence upon their children. They must, unless they can make up their minds to risk their health and their lives.—*N. Y. Adv.*

SILK WORMS.

The white silk worms hatch twice a year—the yellow but once. The latter spins much the largest ball, and is accounted the most valuable and greatest troublesome.

The price of eggs is sixpence a thousand.

Each miller deposits about 400 eggs.

It is calculated that the worms produced from the eggs of 200 millers, or winged worms, will make ten pounds of silk.

One hundred and fifty pounds of leaves, it is estimated, are eaten by 1000 worms, to spin 1 lb. of silk.

It takes about 1 bushel of yellow cocoons or balls, to make 14 lbs. of silk.

One ball of silk, of the yellow kind, when spun will measure 1750 feet.

The eggs of the silk worm are of two colors; a lightish slate, and a yellow. The latter are held in poor esteem; they seldom contain the vital principle.

THE SHAKER'S CIDER.

A tourist whose observations appear in the New York Commercial Advertiser, gives the following respecting the mode of making and preserving cider as practised by the Shakers of Canterbury, in New-Hampshire.

• Their fine cider sells in Boston for \$10 the

barrel, a fact which has several times gone the rounds of the newspapers. We made particular inquiries respecting their mode of manufacturing this article, but could not learn that they had any peculiar process. Their fruit is of the ordinary kind, and the apples are gathered as they fall, and housed. Late in November they are ground in a mill, after the defective ones have been carefully separated, and the pomace is suffered to remain in the vat over night, and until it assumes a red color throughout. It is then pressed in the usual manner, and the cider is put into casks perfectly clean and sweet. They prefer rum hogsheads, when it is possible to obtain them. In December, after the fermentation has subsided, they rack off the cider, and add to each hogshead a gallon of brandy distilled from the lees. In March they again rack into clean hogsheads, and the liquor requires no further attention. They never drink it until it is at least two years old, and it continues to improve by age. "That which we tasted was five years old."—*Harford Times*.

AN ENGLISH COTTAGE.

There is a family at Winsor Green, just in the vicinity of B——m, which I have occasionally seen; and as I consider them, in manners and style of living, a very good specimen of those middle walks of life, I will give you an account of a late visit there, and will mingle character and description with incident. At the close of a fine day, a young Bostonian and myself, conducted by a son of the family, called at the door of their cottage. By cottage you will not understand me to mean a one-story, straw-thatched building, half hid in woodland, but a neat two-story brick mansion, covered with slate. We paused a few moments in the front garden, to look at its arrangement. I have often had occasion to admire the taste, which Englishmen of this class exhibit in laying out and decorating their gardens and pleasure grounds.—Whenever they fix upon a spot and call it 'home,' they collect about it every little comfort and elegance that their means will admit. A garden seems to be the primary object in their rural economy; and even when their means are scanty, and they are necessarily confined to a narrow spot of ground, they contrive to throw over that spot a thousand beauties. This taste, I conceive, cannot be too highly commended. It is not less elegant in itself, than it is favorable to purity of manners. The same fondness for a garden and flowers may be traced in the lowest artisans and cottagers; and when they are denied the luxury of a garden, they will make a garden of their houses, and fill every window with flowers, and plants. The garden which we were now surveying, was enclosed with a hawthorn hedge, and two gravelled walks led up each side of a closely shaven oval grass plot, to the front door. Trees of various kinds mingled with shrubbery skirted the edges, and gave to the centre a charming aspect of pensive retirement, and rural quietness.—The lawn, by the use of a cast iron roller, and frequent shaving, had become extremely smooth, and was not only cheering to the eye, from its vivid green, but pleasant and soft as down to the foot.

From the front garden we were conducted through a gate at one corner of the house, into the fruit and flower garden. This was somewhat larger than the other. Like that it was enclosed in a hawthorn hedge, which, by constant trim-

ming and good management had become so closely interwoven and matted together, as to form as effectual a barrier against the intrusion of cattle or the prying curiosity of man, as a brick wall itself. The hedge under the hand of a skillful gardener, can be made to assume the most fantastic shapes. This was so close, that neither the hand nor the eye could penetrate it; and clothed as it then was, in the brightest green, it far surpassed in beauty, any fence or railing, and was more in harmony with the scenes around.

As might be expected, we found ourselves very pleasantly entertained, in strolling over this enclosure. Flowers of all hues, and every fragrance, spread their charms before us, and together with the fine fruits which abounded in it, our senses were variously regaled. At the termination of the walks was some object to call and divert the attention—a summer-house, an arbour, or a rustic seat. In the centre a sun-dial marked the wane of time; and at the foot of the garden, flowed a small stream, which formed several cascades, and finally passed off with a rippling sound, and was lost to the eye under an arbour. There was here nothing extravagant, and nothing more than what most of our farmers and tradesmen might command, with a very little attention and trifling cost. The fruit-trees and plants would afford them amusement in their leisure hours, as well as reward them with their products; and the cultivation of flowers would give their daughters a refined and healthy employment.—*Christian Spectator*.

ON LIVERWORT AS A CURE FOR CONSUMPTION.

The plant called liverwort, has recently acquired, through the medium of the new-papers, considerable celebrity as a remedy for consumption. Its reputation is altogether unmerited; its administration must be pernicious in ninety-nine hundredths of the cases in which the lungs are affected. *Its operation is decidedly stimulant*; and the faculty well known how few phthisical patients will bear remedies of that description. A patient of mine insisted upon using the liverwort in spite of my remonstrances. It gradually accelerated his pulse until a spitting of blood was the consequence. This satisfied him, the plant was abandoned, and his health immediately began to improve. Like other excitants, the liverwort when first taken, improves the feelings of the patient; and hence perhaps, in part, its popularity. Its ultimate effect must in general, however, be such as I have stated.—*N. Y. Farmer*.

Cure for stammering.—Those who suffer under the distressing affliction of an impediment in their speech may be effectually cured—where there is no malformation of the organs of articulation, by a perseverance for three or four months, in the simple remedy of reading aloud with the teeth closed, for at least 2 or 3 hours in the course of each day.—*London paper*.

Temperance.—The people of Hardwick, Vermont, have *universally* agreed to discontinue the use of ardent spirits except as a medicine, and the merchants have ceased to keep it except in the way they keep other medicines. It occupies (we suppose) its proper place among other medicines and poisons, such as arsenic, oil of vitriol, aquafortis, laudanum, spirits of turpentine, nux. vomica, &c.

MELONS.

These are cultivated in all the warm countries of Europe, and also in Asia, Africa, and America, where its salubrious and cooling fruit is greatly esteemed.

The cultivation of the water-melon is so well understood in the United States, that no directions on the subject are requisite. They afford a very refreshing article of diet in our warm summers, and yield considerable profit. "The juice of the sweeter kind yield, on inspissation, a bright light colored syrup, which would answer every purpose required of any syrup. Mr. H. Drinker, of Philadelphia, procured half a pint of this syrup, from fourteen pounds of melon juice, a part of which I tasted, and found very pleasant. Mr. Doreley, who is practically acquainted with the cultivation of the fruit, makes the following calculation upon Mr. Drinker's experiment: "Melons growing at 5½ by 5½ feet apart, are 1,453 plants on an acre; these bearing two melons of 14 pounds each, yield 4000 pounds of melons, 1,433 pints of syrup—which, at ten cents, would come to one hundred and forty-three dollars, for an acre's produce."

Taking the amount at one half the above sum, it would be more than is produced from many acres of land, in other cultivation, in sandy impoverished soils. Having millions of acres covered with the sugar maple, and thousands of acres fit only for the cultivation of the water-melon, the United States need be under no apprehension of the want of sugar. Dr. Pallas, in the account of his journey to the southern province of Russia, in 1793 and 1794, speaking of a colony of Moravians at Sareps, or Sarpa, on the river Volga, says, "the ingenious inhabitants of this town brew a kind of beer from their very abundant and cheap water-melons, with the addition of hops; they also prepare a conserve or marmalade from this fruit, which is a good substitute for syrup or treacle."—*Domes. Encyclopedist*.

The Lombardy Poplar.—It is observed that the Lombardy poplar is decaying in every part of our State. I have seen hundreds, my thousands, this spring, in our north and northwest sections, many of which had put forth their vernal foliage with vigor and luxuriance, and have since withered and died.—*Albany Argue*.

Coal in Pennsylvania.—It has been estimated, and we think with great propriety, that one third of the whole State of Pennsylvania, is pervaded with coal, and we may safely put this down as averaging at least 3 feet in thickness. The whole area of the commonwealth is 43,950 square miles; one third of this is 14,650—the area of the coal fields. A square mile at three feet thick will yield nearly four millions of tons of coal. It is thus demonstrated that the coal fields of Pennsylvania will supply one million of tons, or twenty-eight millions of bushels of coal annually, for nearly sixty thousand years. Enormous as this computation may seem, we venture to say it is much below the reality. Any one acquainted with the coal localities, we think, will not object to the assumption, that one third of the whole commonwealth is pervaded with coal beds, and that these are over three feet thick. It would indeed be nearer the fact to say they average above six feet thick.—*Phila. Aurora*.

Early corn was advertised in the Virginia papers as fit for the table, on the 25th of June.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 11, 1828.

At the annual meeting of the Massachusetts Society for Promoting Agriculture, held at the hall of the Massachusetts Bank, June 11, 1828.

Mr. LOWELL having declined a re-election to the office of President, it was voted that the "thanks of the Society be presented to the Hon. JOHN LOWELL, the late President for his eminent services in that office; and that the Society be deeply sensible both of the reputation it has acquired, and the substantial benefits secured to the agricultural interests of New England, by the unwearied exertion of his great and various powers, and by the promptitude and kindness, with which he has availed himself of every opportunity to communicate the benefit of his extensive acquirements to his fellow citizens."

A true copy from the record.

BENJ. GUILD, *Assist. Rec. Sec'y.*

Brookline, June 11, 1828.

The following officers were chosen for the ensuing year.

Hon. TH. L. WINTHROP, *President.*

Hon. ISAIAH THORNDIKE, *1st Vice President.*

Hon. THO. H. PERKINS, *2d do. do.*

JOHN HEARD, *Esq. Treasurer.*

RICHARD LOWELL, *Corresponding Secretary.*

RICHARD SULLIVAN, *Recording Secretary.*

BENJ. GUILD, *Assistant do. do.*

Trustees.

Hon. PETER C. BROOKS.

Hon. JOHN WELLES,

G. PARSONS, *Esq.*

E. H. DEBAY, *Esq.*

JOHN C. GRAY, *Esq.*

SWINE.

An Ohio Farmer recommends coals as useful in fattening hogs. After giving his hogs a small quantity daily, say two pecks to each, about the size of a hen's egg, they discontinued rooting were more quiet, and appeared to fatten faster.—He omitted the coal a few days and they commenced rooting; he gave it again, and they ceased to root. He supposes that the coal corrects the morbid fluid in the stomach which incites them to root deep in search of fresh earth. Hogs in summer should at all times have water in which they can wallow, and they will enrust themselves with a coating of mud, so as to prevent their being troubled with vermin.

WEANING LAMBS, &c.

The weaning of lambs should be effected about this time, or when the lambs are from six weeks to two months old. At this age they should be taken from the ewes, and have the best of pasture during the first fortnight; by the end of which time they will be so much accustomed to living on grass that they may be turned into a poorer pasture. It is important that the lambs when weaning should have a good bite of fresh grass, otherwise their growth will receive a check which no subsequent management can overcome. Where they have grazed with their dams so long as five or six weeks little hindrance to their growth will be sustained by the separation. The ewes should be removed to such distant pastures or other places as that their bleating may not be heard by the lambs. There is, however, one can-

tion to be attended to in turning lambs into a rich pasture, which is to let them be in some degree satisfied with food, previously, that they may not be surfeited or hoven or swollen. Should this disorder occur the distempered animals should be treated as directed, page 334 of our current volume. On weaning the lambs, it may be necessary to milk their dams several times, in order to relieve their udders, which otherwise sometimes become swollen and painful.

The worst woolled lambs, had colored ones, and those that are very small, should be made over to the butcher, and need not be weaned. It is recommended, however, not to kill or sell for killing any lambs till they are about six months old, at which time their fleece becomes valuable.

"Those ewe lambs, which are intended for stock," according to Deane, "should not come at the rams. For if they have lambs at a year old, it stunts them in their growth; and they have so little milk that their lambs commonly die for want of nourishment. Or if they chance to live, they will be apt to be always small. This practice is one reason why our breed of sheep in this country is so poor.

"The largest lambs should be sheared at the time of the new moon in July. Their fleeces will yield as much the next year, and the wool will be better; and as cold storms rarely happen at that time of the year, the lambs will do better without their fleeces than with them.

GRASS LAND.

By lying, is apt to become uneven and knobby. To prevent this, good farmers pass a roller over their land every spring and fall. This gives the roots of grass a more equal advantage for nourishment and growth, facilitates the moving of the grass, and the raking of the hay.

When land becomes bound, or its surface matted together by interwoven roots of grass in such a manner as to lessen the crop, if it be not convenient to plough it up, it should be cut or scarified by a spiked roller; or if the farmer do not possess this, by a heavy loaded harrow, when the ground is softened by rains or the coming out of frost. It may then be dressed with some sort of compost, composed of materials which will not lose their virtue by exposure to the sun nor be easily washed away by rain; and harrowed again, so as to mix the manure with the surface of the soil. There is no danger of destroying the roots of the grass by harrowing. Though they be broken they will be speedily renewed; new offsets will be more plentifully formed, and the crops will rise with renewed vigor.

As a general rule, dung, or the recrement of animal and vegetable substances cannot be profitably applied to land which is covered with a thick sward. The sun, the atmosphere, and the neighboring streams of water in such case become the recipients of nearly all the fertilizing particles of manure thus applied. When grass land becomes impoverished by repeated crops of hay being taken from it, the soil should, as a general rule, be ploughed, and manure applied to the arable crops, such as potatoes, Indian corn, mangel wurtzel, &c. and when thoroughly subdued, and made abundantly rich, it should again be laid down to grass, with great plenty of grass seed.

But it is often the case that good grass land is too moist or too stony for arable crops, and yet may need reclaiming by some kind of manure. In

such case, light dressings, such as soot, coal-ashes, peat, or wood-ashes, lime, malt-dust, &c. &c. are often highly beneficial. Sir John Sinclair says, "as there are strong objections to the application of pure dung to grass lands, (much of its strength being evaporated, from its being exposed to atmospheric influence) composts are greatly to be preferred. They may be applied at the rate of from thirty to forty cubic yards per acre. To keep grass land in good condition, a dressing to this amount is required every four years. The application of unmixed putrescent manure, will thus be rendered unnecessary, which ought at least to be avoided in meadows, (or pastures) appropriated for the feeding of dairy cows, from its affecting the quality of the milk."

It was remarked in Deane's N. E. Farmer, that "it is ridiculous to think of taking many crops of hay from any piece of upland, in uninterrupted succession, without affording it any manure. For it does not imbibe the richness of the atmosphere so plentifully as land in tillage. Grass land should, therefore, once in two or three years at least, have a dressing of good rotted dung or of a compost, suitable for the soil. But the best way is to do it every year. Autumn is the time for applying manure, according to long approved practice. But a writer in the Geographical Essays recommends doing it immediately after the first mowing when a second crop is expected, which will undoubtedly be the larger."

The last edition of the same work, under the head "Top Dressing," contains the following observations: "There is scarcely any question, on which farmers are more divided than as to the policy of applying manure as a top dressing to grass lands in spring or fall. The reasoning seems to be in favor of spring dressing, and it is supported by many excellent names. But it ought to be known that intelligent farmers, near the metropolises, most generally dress their lands in autumn.— Besides the reason stated above that grass lands are less injured by carting over them in the fall; it may be added, that it is a season of greater leisure, and although it is confidently asserted that the manure is wasted by rains and snows, yet much ought to be allowed on the other side, for the protection afforded by the top dressing, to the tender roots of plants during winter; and ought we not to allow something for the low temperature of the atmosphere in winter, which prevents evaporation? Whatever principles of fertility exist in manure, are in winter carried down into the soil. We are fully convinced that a scorching sun, and drying air, are more pernicious to manures, spread thinly over the surface than any drenching rains can be, unless on declivities, where top dressings are unquestionably of less value than on level grounds. The fact, that farmers, who grow rich by supplying great towns with hay, generally adopt the practice of fall dressing grass lands, deserves weight."

LARGE TIMOTHY.

Among other specimens of the uncommon fruitfulness of the present season, we have seen spires of Timothy, or (as it is most usually denominated in the northern states) Herd's grass, which grew on the farm of Mr Jeremiah Crosby, of Billerica, with heads 14 inches long! Good soil, good culture, and a good season must be united to produce such samples of fertility.

AGRICULTURAL TOAST.

At the State celebration of the late anniversary of American Freedom, held in Boston, in which were present his Excellency the Governor, the Secretary of State, and most of the dignitaries of the Commonwealth, C. P. SUMNER, Esq. Sheriff of Suffolk gave the following toast:

"Agriculture,

In China's realm, from earliest days till now
The well loved Emperor annual holds the plough.
Here too, our worthiest candidates for fame,
With unsold honor, sometimes do the same;
Upholding such, our generous yeomen's hearts
Show a just reverence for the first of arts."

It is pleasing to observe that the culture of the ground, the heaven-prescribed employment of the first man, is still held in the highest estimation by our first men.

The Marblehead Social Society have passed a vote of thanks, and forwarded the same, to Rev. John Pierpont, for delivering his discourse before the Ancient and Honorable Artillery Company on their 190th anniversary.—*Salem Reg.*

This discourse has had a most extensive circulation through the newspapers, in all parts of New England, and is worthy the perusal of every intelligent and reflecting man. We understand it has already passed through two editions, in the pamphlet form, of upwards of 5000 copies.

MAKING THE MOST OF LAND.

Capt. James Perkins, of Essex, Mass. raised, last season on an acre and a half of land, 72 bushels of Indian corn, 70 bushels of potatoes, 70 bushels of winter apples, 80 bushels of turnips, 2 loads of squashes, and 2 bushels of beans. One third of the land alluded to consisted of gravelly knolls. In 1826 the whole was planted with Indian corn.—*Communicated.*

The Hon. Stephen Van Rensselaer has established a School in Troy, designed to teach experimental philosophy, and its application to agriculture and the mechanic arts.

Nantucket sheep shearing.—The number of sheep assembled at the late shearing in Nantucket, was about 12060. The wool is worth from twenty to twenty-five cents per pound.

The corn field of Mr. Asahel Ives of this town as we are informed, was attacked not a great while since by an army of Crows which in the space of a few minutes destroyed 2,400 hills of corn.—*Berkshire American.*

ELDER BERRY WINE.

Recipe.—One bushel, when picked from the stalks, produces three gallons, or upwards, of berries; put these to seven gallons soft water; after standing forty-eight hours, put them into the copper, let them boil one hour, then press the juice through a coarse cloth, then put the liquor into your copper again, with twenty pounds of raw sugar, half a pound of Jamaica ginger, bruised, one ounce of cloves, and one ounce of allspice.—Boil the whole together one hour—then put it into a tub, and when cold enough, add some good barm or yeast, spread on a toast, and in two days, put it all into a cask, and lay the bung tightly on for two months; then add one quart of brandy; this wine will keep, if required, several years.

Royal Relic.—The mace belonging to the Royal Society was the gift of King Charles the Second, and is the identical one pointed at by Oliver Cromwell when he said, "Take away that bauble!" on the memorable occasion of his dissolving the Long Parliament.

"Oh Love! what may thy emblem be?"
A skien of yara arrests a troc.

Two young ladies recently divided a skein of yarn and hung themselves on a tree near Palmyra, Ohio, and "all for love." Before life became extinct they were discovered and restored.

From Foreign Journals.

ENORMOUS SPIDERS.

In the Brazils, the spider reaches an enormous size, with different habits from those of Europe. It stretches its web from tree to tree, and no longer appears a solitary insect; man, hundreds lie together, and form nets of such strength, that you may often see a bird of the size of a swallow, quite exhausted with struggling, and ready to fall a prey to its indefatigable enemy.

COLOR OF SOILS.

An experiment which I have often repeated upon light as well as tenacious soils with like success, demonstrates how greatly the color of a soil influences the accumulation of heat. Coal ashes were sprinkled over half the surfaces of beds sown with peas, beans, &c. and on these the plants invariably appeared above ground two or three days earlier, obviously on account of the increased warmth; it being a well known fact, that dark colored bodies absorb caloric more readily, and in larger proportions, than those of a lighter hue.

FRENCH SOUPS AND SAUCES.

A French cook is indebted for his delicious sauces, entirely to the produce of the kitchen garden. Ginger, Cayenne pepper, and the host of hot exotics, which in England render the palate a fiery furnace, are wholly excluded from French cookery. Wine, oil, butter and bouillon (stock) form the basis of all soups and gravies; which are flavored with herbs from the garden. French cookery may therefore be pronounced extremely healthy, in-stead of the reverse, as is supposed in England.

* * An article on the manufacture of Soda will soon appear. Also, an article from Lynn, on the canker worm.

Ont Meal, Ont Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a fourth supply of the above articles, viz. 30 barrels of fresh Ont Meal, fine boiled Ont Flour, Hulled Oats or Vermont Rice, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Ont Flour, neatly packed, at 50 cts. per canister.

"Bleaching Powder."

For sale at the New England Farmer Seed Store, the Bleaching Powder described on the first page of this week's paper, by Professor WESTER of Harvard University—by the pound or cwt.

Massachusetts Agricultural Repository.

Just published by Welch & Lilly, Court Street, Boston, price 50 cts, the Massachusetts Agricultural Repository and Journal, Number 2 vol. x. Roman.

This elegant, full blooded horse, a bright bay with black legs, mane and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams in Northborough, Ms. at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, May 16.

Barfoot and Sarah.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Coffin, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Bares of aches out horse, is as follows.

DATED 1830.

Barfoot, by Trump, dam Rosmond, by Pezzard, out of Rosberry, sister to Hbley and Tantal, by The Noncon, out of Miss West by Matcham.—Vergulus—Crown—Chiffon, raised.

In 1821, when at Pontefract, swept stakes of 20 sovs. each, 13 two years olds—11 sobs.—Barfoot beating Harpout.

In 1823, York Springs St. Ledger, of 25 gs. each, 6 sobs.—Barfoot beating four others.—A. Pontefract sweepstakes of 4 guineas each ten fcs, 10 subscribers.—Barfoot beating Palatine.

In 1823, the Doncaster great St. Ledgers, of 25 gs. each, 30 subscribers.—Barfoot beating 11 others.

In 1823, at New Market, Barfoot won a handcup plate value £50, beating Tresshan and five others.

In 1824, at Ascut Heath, Barfoot walked over for the Swags stakes, of 25 sovereigns each 3 sobs.—

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns, 17 sobs. of all ages.—Barfoot beating Latory and two others.

In 1826, at Manchester, Handcup stakes of 20 sovereigns each, 10 ft. with 20 sovereigns added—60 subscribers.—Barfoot beating two others.—At Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 10 sovereigns each, 9 sobs.—Barfoot beating two others.

SCARLE, (a bound by Horse) FOALD IN 1821.

Got by Phanton out of Jesse, by Tubridge—her dam Cracker by Highley, out of Nutcracker, by Mareson.

In 1821, won the New Market 3 Cops, 30 gs. each 21 sobs.—Scrab beating four others.

In 1823, at the New Market Crane meeting, the stakes, 100 sovereigns, 7 sobs. Scrab beating two others.—The same year, Spring meeting, Scrab won Handcup sweepstakes, 100 sovereigns, beating three others.

In 1826, Scrab won Kings Plate, 100 gs. beating 30 others.

In 1827, Scrab won the gold cup, 143

MISCELLANIES.

From the *Legendary*.

THE EXILE AT REST

BY THE REV. JOHN PIERPONT

His falchion flashed along the Nile;
His hosts he led through Alpine snows;
O'er Moscow's tower, that blazed the while,
His eagle flag unrolled—and froze.

Here sleeps he now, alone!—not one
Of all the Kings whose crowns he gave,
Bends o'er his dust;—nor wife nor son
Has ever seen or sought his grave.

Behind this sea-girt rock, the star
That led him on from crown to crown
Has sunk;—and nations from afar
Gazed as it faded and went down.

High is his couch; the ocean flood
Far, far below, by storms is curled;
As round him heaved, while high he stood,
A stormy and unstable world.

Alone he sleeps! the mountain cloud
That Night hangs round him, and the breath
Of morning scatters, is the shroud
That wraps the conqueror's clay in death.

Pause here!—The far off world at last
Breathes free; by the hand that shook its throne
And to the earth its mines cast,
Lies powerless now beneath these stones.

Hark! comes there, from the Pyramids,
And from Siberian wastes of snow,
And Europe's hills, a voice that bids
The world be awed to mourn him! No

'Tis only, the perpetual day
That's heard here, is the sea bird's cry—
'Tis the mournful murmur of the surge—
The cloud's deep voice—the wind's loud sigh

Fog.—A London fog is a sad thing, as every inhabitant of London knows full well; dingy, dusky, dirty, damp—an atmosphere black as smoke, and wet as steam, that wraps around you like a blanket, a cloud reaching from earth to heaven; a palpable obscure, which not only turns day into night, but threatens to extinguish the lamps and lanterns, with which the poor street-wanderers strive to illumine their darkness dimming and palting the inefficient fires, until the volume of gas at a shop door cuts no better figure than a hedge glow-worm—and a dutches's lambeau would vil its glories to a will-of-the-wisp. The very noises of the street come stifled and smothered through that suffocating medium,—din is at a pause—the town is silenced, and the whole population hip-d and quadruped, sympathetic with the dead and chilling weight of the out-of-door world. Dogs and cats just look up from their slumbers—turn round, and go to sleep again; the little birds open their pretty eyes—stare about them—wonder that the night is so long, and settle themselves afresh on their perches. Silks lose their gloss—cravats their stiffness—hackney coachmen their way; young ladies fall out of curl, and mamma out of temper—masters scold—servants grumble, and the whole city, from Hyde Park corner to Wapping, looks sleepy and cross, like a fine gentleman roused before his time, and forced to get up by candle-light. Of all detestable things, a London fog is the most detestable.—*Lon. Mon. Mag.*

Ghost Story.—The Springfield Republican states that the people in the neighborhood of Mount Tom, in West Springfield, have been troubled on account of a babbling ghost, which some workmen pretended to have seen in the night. One man said that he had not only seen the ghost, but conversed with it, (although it had no head,) and that the headless form informed him that he was the ghost of Timothy Felt, who was murdered about three years ago. The people turned out to find the bones of Timothy Felt, but did not discover them.

It is strange that any portion of the community should be so stupidly ignorant as to credit for a moment any stories about ghosts, witches, and hobgoblins. When will such delusions cease?—*Hampshire Gazette.*

Loading Hay on Chili.—A writer in the Christian Spectator, who has spent several years in Chili, (or Chile) remarks that almost all substances from the earth and sea, are transported on the back of mules in that country. Hay is wholly brought to market in that way. A man mounts his mule and stands erect, while a second throws him up bundles of long green hay, which he places round him as our hay-makers load a cart.—When the mule is so laden that nothing but his long ears and the owner's head are visible, he is brought to the city, where the rider sells to one and another until his load is gone.

Long sticks of timber are brought to market on mule-back, one on each side of the animal. They are crossed and lashed two together on the saddle; the lower ends drag on the ground behind, and sweep the whole street.

The editor of the Reading Journal says that he has tried the experiment of pouring boiling water upon the roots of a Peach tree, the leaves of which had become sear and dry, and the limbs in a rapid state of decay—"in one week it began to revive, and in three weeks it was covered with a new foliage, and new vigorous shoots are putting out, in all directions."

If this is the case, the joke cracked upon Mr. Triptolemus Yellowly's young orchard, in Scott's novel of the Pirates, loses all its point: and in a future edition, it would be well for the author to give that matter a new turn.

To make molasses beer.—Take five pounds of molasses, half a pint of yeast, and a spoonful of powdered ginger—put these into a vessel, and pour on two gallons of scalding hot soft water—shake the whole till a fermentation is produced—then add of the same kind of water sufficient to fill up your half barrel. If the cask be greater or smaller than this, the component parts must be in proportion. Let the liquor ferment about twelve hours—then bottle it, with a raisin or two in each bottle.—*Farmer's Assistant.*

Large tree.—The largest tree in the world is said to be the *Adansonia digitata*, which is found in Senegal, Egypt, and Abyssinia. The trunk is from 20 to 30 feet in diameter, and divides into branches of great size, which spread out drooping at the extremities, and form a mass of verdure 150 feet in diameter, and 70 feet in height. The wood is light and soft, and the negroes sometimes hollow out chambers in the trunk, and deposit their dead within them, where they become mummies, perfectly dry and well preserved.—*Han. Gaz.*

Difference of Constitution.—Substances that are poisonous to one tribe of animals are medicinal to a second, and even highly nutritive to a third.—Thus, swine are poisoned by pepper seeds, which to man are a serviceable and grateful spice; while henbane roots, which destroy mankind, prove a wholesome diet to swine. In like manner, aloes, which to our kind is a useful medicine, is a rank venom to dogs and foxes; and the horse, which is poisoned by the water hemlock, and corrosive sublimate, will take a dram of arsenic daily, and improve thereby both in his coat and condition.

N. Y. Farmer.

Marine Fans.—In the bed of the Red Sea, and on some parts of the coast of America, there grows a very curious marine plant, which is flat, and spreads very much like a peacock's feather. Its color, in general is tawny, but some are found of a very fine olive. It is formed of innumerable ligneous fibres, interwoven together, and is as supple and as tough as whalebone. They are sometimes found eighteen inches long in the Red Sea; and are eagerly sought by the women of America for fans. In some instances these plants are found of a very beautiful red, or variegated, when of course their value is greatly increased.

Indelible ink, for marking on linen cloth, &c. is made by dissolving one drachm of lunar caustic and half an ounce of gum arabic in half a pint of pure rain water. Previous to using it the cloth to be marked should be wet with a preparatory liquor made by dissolving one drachm of salt of tartar in half a gill of rain water, and thoroughly dried and ironed.—*American Adv.*

It is estimated that there are 60,000,000 gallons of lamp oil used every year in the United States.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta, The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and Yellow Aberdeen or Bullock are preferable. The Yellow Aberdeen is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, Yellow Ruta Baga, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turnip Radishes, suitable for growing the three ensuing months. Prickly or Fall Spineh, Long Prickly and Early Cluster Cucumber, also the common Gurkin Cucumber, or West India peckling one of the finest pickles.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it the growth of 1827.—to dealers and purchasers by the quantity, it will be put at a low rate.

Also, genuine Fowl Meadow Grass from Vermont—Orchard Grass, Lucerne, &c.—Hemp, White Mustard, Flax Seed, &c. At this place is kept the best supply of seeds, native and imported, that art and industry can procure. July 4.

Seeds for the West Indies.

Merchants, masters of vessels and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixties different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.—Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Bremen Geese.

For sale, 10 pair fine Bremen Geese. Apply at the New England Farmer Seed Store. July 4.

Published every Friday, at \$3 per annum, payable at the end of the year—but those who pay within sixly days from the time of subscribing, are entitled to a discount of 50 cents.

DOMESTIC ECONOMY.

FOR THE NEW ENGLAND FARMER.

A METHOD OF PROCURING FRESH WATER PURE AND WHOLESOME.

(Translated from the French.)

MR. FESSENDEN.—The process which is here proposed is not wholly unknown to scientific men; but it may be useful to publish it for the benefit of those, who reside in places, where the water is not of the best quality. The method is to make use of pulverized charcoal, which has the property of attracting all the products of vegetable and animal decomposition, held in solution in the water. The water of sewers, the most foul, and of marshes the most muddy, may be rendered as clear, and agreeable to the taste, as that of the best fountains, by filtering it through a few inches of charcoal dust. Many persons perish, annually, during the warm season, in consequence of using foul and putrefied water.

Any person can afford to purchase a half cask, and adopt to it a wooden cock, with a false, movable bottom, and five or six cents worth of charcoal. Sailors, also, may provide themselves with casks, prepared by this method, by which means they will be able to supply themselves with good water, during a long voyage.

I believe that an industrious man, might, (in many situations) find his account in purifying water in this manner, as the process is simple, and the apparatus costs but a trifle.

With esteem, yours,

A. PARMENTIER.

Botanic Garden, Brooklyn. }

FOR THE NEW ENGLAND FARMER.

CANKER WORMS.

MR. FESSENDEN.—The desolating ravages of the canker-worm in various parts of the State, call for the energetic exertions of agriculturalists and orchardists, to destroy them. Various experiments have been attempted to stop the progress of the grub while attempting to ascend the fruit trees. Encircling the bodies of the trees with a rim of tar, has, the last season, been found to be completely successful in this town, where properly and faithfully applied. Several fine orchards, (which the preceding seasons exhibited the appearance which marks the progress of these destructive insects) are now clothed with luxuriant verdure and fruit; while orchards immediately adjacent which have not been tarred are completely divested of fruit and foliage.

The method pursued by those who have been successful, was to encircle the trees with a bandage of coarse cloth and apply the tar on the cloth every evening about sunset. In the morning the tar was found to be full of grubs and millers. The tarring was attended to in the preceding fall as well as in spring, many of the grubs were caught in November, and in February; and it is found that they ascend at all times after the first freezing, when the ground is sufficiently thawed to allow them to extricate themselves. The past season has been particularly unfavorable:—for the

softness of the weather has made it necessary to tar many months to effect their entire destruction.

In some instances, they have also dug up the soil about the trees, exposing the grubs or eggs to the frost, or to be devoured by dung-hill Fowls. This, no doubt, had some effect; but these insects are so amazingly prolific, that, if only a few ascend, the tree is injured.

I had formerly supposed, that some other method would be found to be more expedient and effectual than tarring; such as, perhaps, putting lime about the roots, or tan, clay, or sea-weed, or moving all the soil from around the trees to a distance and supplying its place with such as was not infected with the deposits of the worm. I had also supposed that tarring, taking into consideration the trouble, expense, uncertainty and the injury of the tar to the trees, would be nearly equivalent to a total loss. But I am now convinced that the canker-worm may be exterminated by this method, and that the cause of failure hitherto has been, that the grub has stolen a march upon in the autumn and winter.

Certain it is, if the canker-worm should continue its ravages many years, some of our finest orchards will be entirely ruined. These considerations have induced the foregoing remarks from
Lynn, July 8, 1828. A FARMER.

From the Massachusetts Agricultural Repository.

RAW POTATOS BAD FOR MILCH COWS.

The following article taken from a foreign magazine, has been copied lately into the American Farmer and the New England Farmer:

"Many farmers are in the habit of giving raw potatoes to all kinds of stock; but they are of a watery and gripping nature, and accidents have frequently happened from their use, before the cattle have been accustomed to them. For milch cows, they are very bad, purging them, and rendering their milk too thin and poor, even for suckling. If given raw to fatten oxen, good hay and bean meal should be allowed, to counteract the watery quality of the roots. There is, however, much difference in the nature of potatoes, and the mealy approach nearest to the nature of corn, the yellow afford the strongest nutriment."—*Scotch Magazine.*

REMARKS.

Nothing can be of greater importance to every farmer, than a correct knowledge of the comparative merits of the different varieties of food for his cattle. Of course nothing can be more pernicious, than throwing out loose and general censures of any particular species of food, particularly of those most easily raised, and therefore the cheapest. I certainly am not disposed to set up my authority against opinions advanced in established works. But there is no reason in tating facts, in relating careful and long continued experiments. For nearly twenty years, I have been in the practice of allowing my milch cows from November till they go to grass about three pecks of roots a day with good English, or upland hay to their full content. I first commence with the beet, because it is most perishable; carrots then follow, and from February till May, they have raw potatoes. In commencing with the potatoes, they will

be for a few days relaxed; so they will (often) to as great a degree, with Indian meal; after a little use, they return to their natural state of body, and are always in high condition when they are turned out to grass—perhaps they are too fat.

Potatoes, then, cannot be a watery, gripping food, my milk is as rich as the milk of cows let thus managed. My cows have been almost always raised by myself from my own stock, and I usually keep them till they are aged. If the proposition stated in the extract at the head of these remarks had been true, or nearly true, or had I any degree of soundness in it, it seems to me impossible, that I should never have remarked the ill effects stated.

Some farmers may consider these remarks as of less weight, as coming from a man not bred a farmer. Some may suppose that I trust the eyes of others, and am deceived. To these possible objections, I reply, that my cows are objects of special regard, as furnishing me with one of the most valuable luxuries; that I attend to them personally and carefully, and I can see no good reason why an attention of twenty years should not enable me to form as correct an opinion as a thorough bred farmer. I am not, however, without support from persons of that description. An intelligent practical farmer, whose dairy is in such repute that he obtains from thirty-one to thirty-seven cents a pound for his butter, assured me, that he always gave his cows in winter the long red potato in a raw state, and that he estimated two bushels of that potato for his cows as equal to one bushel of corn. JOHN LOWELL.

CURRANT WINE.

Extracts from the Report of Messrs. Bartlett & Harvey to the Rockingham Agricultural Society, at a Cattle Show, held in Exeter, N. H.

The samples of wine exhibited, were of white and red by Mr. Samuel B. Stevens of Exeter; and of red, by Joseph Tilton, Esq. of Exeter.—The wine from the white currant, for body and flavour, was preferred; and the committee award to Mr. Stevens the premium. This wine had no distilled spirit mixed with it, and was made by the following receipt:

"To each gallon of clear juice was added two gallons of water, and to each gallon of the mixture was added three and a half pounds of white Havana sugar, and put immediately into a clean wine barrel; after it had done fermenting it was bunged tight."

The red wine of Mr. Stevens was made by the following receipt.

"To each gallon of clear juice was added two gallons of water, and to each gallon of mixture was added three and a half pounds of good brown sugar and put into good barrels; after it had done fermenting, it was stopped tight. In February after it was made, one gallon of the best 4th proof Cognac brandy was added to each barrel, and stirred up thoroughly."

A late London paper states, that the duke of Buckingham has, at his seat at Avington, a team of Spanish asses, resembling the zebra in appearance, which are extremely tractable, and take more freely to the collar than any of the native species.

Extract from a Treatise on Agriculture, originally published in the Albany Argus.

RYE.

This grain, though of the same family with wheat, is less valuable. A bushel of rye weighs less, and gives less flour, and of worse quality, than a bushel of wheat. In comparison, therefore, with wheat, it fails; still there are circumstances, which, as an object of culture, may give it the preference: 1st. It grows well in soils where wheat cannot be raised: 2d. It bears a much greater degree of cold than wheat: 3d. It goes through all the phases of vegetation in a shorter period, and of course exhausts the soil less: 4th. If sown early in the fall, it gives a great deal of pasture, without much eventual injury to the crop: 5th. Its produce, from an equal surface, is one sixth greater than that of wheat.—These circumstances render it peculiarly precious to poor soils and poor people—to mountains of great elevation and too high northern latitudes.

Its use, as a food for horses, is known as well in this country as in Europe. This grain chopped and the straw cut and mixed, forms the principal horse food in Pennsylvania; and in Germany, the postillions are often found slicing a black and hard rye bread, called "bouponnikle," for the post and other horses; and the same practice prevails in Belgium and Holland.

Its conversion into whiskey, is a use, less approved by reason and patriotism; but if a spirituous liquor must be drunk, we have no scruple of preferring the form of whiskey, (of our own making) as that, which, on the whole, is least injurious to the human body and most beneficial for the body politic.

The species of this grain, cultivated here, are two—the black and the white; for spring rye, (often mistaken for a species) is but a variety, produced by time and culture, and restored again to its former character and habits, by a similar process.

According to the course of crops, potatoes, in a sandy soil, precede rye. The ploughing, harrowing, and manuring given to that crop, will therefore make part of the preparation necessary for this. After harvesting the potatoes, plough the ground and sow and harrow in the rye, taking care, as in all other cases, that the seed be carefully selected and thoroughly washed in lime water, as the means best calculated to prevent the ergot; a disease, to which it is most liable, and which is supposed to be an effect of too great humidity.

Rye is not exempt from the attacks of insects; but suffers less from them than either wheat or barley. Whenever the straw of winter rye becomes yellow, shiving, and flinty, and circulates to more pieces, nature makes the signal for harvest, and no time should be lost in obeying it. "Cut two days too soon, rather than one day too late," was among the precepts of Cato; which, if applied here, would save much grain—terminate the harvest about the tenth of July, and give abundant time to rot a down the stubble, and sow the crop next in succession.

Slave Muzzlers.—E. Muldran, of New York, has lately been fined in the sum of \$2,000 as having fitted out a vessel called the *Science*, for the African slave trade, which vessel was some time since sent into New York and condemned.

SILK.

Since we have commenced epitomizing the "Farmer" on the cultivation of silk, it has given us great pleasure to find some of our enterprising citizens already engaged in the nurture of silk worms, and making preparations for an extensive attention to the production of silk. Capt. Anthony Wright, of this town, showed us, a few days ago, four or five beautiful cocoons, made by silk worms on his farm the present season. Capt. Wright has set out a considerable number of mulberry trees, which are doing well; and he will soon have abundance of means for trying the experiment of silk making on an extensive scale.

One or two others, we understand, have embarked in the same enterprise, but how extensively, or with what success in the outset, has not been told us. Our husbandmen would do well to follow this example generally. If an acre of land will support mulberry trees enough for the production of forty pounds of silk, annually, and this is said to be the case, our farmers will find this one of the most profitable uses to which their dry, sandy lands can be appropriated.—*Mass. Ye.*

CREAM.

Pans or trays for holding milk, to raise the most cream, ought to be broad and shallow, and the milk put in them should not be more than three or four inches in depth. Tin and wood are the best materials for making these.

Some lime wooden trays with lead; but this is a bad practice, as lead may sometimes be dissolved by the acid of the milk, and then it is poisonous. Wooden trays ought to be well scalded, and dried in a cool place, as often as new milk is put into them, to prevent the wood from absorbing too much of the acidity of the milk, and thus coagulating the new milk, before the cream; for cream will not rise, after the milk has become coagulated.

If new milk be kept as warm as when it comes from the cow, no cream will rise on it; but, when sufficiently cooled, the cream separates from the rest and rises to the top. In order then to effect this, to the best advantage, the new milk should be made as cool as possible, and the cooler it is thus made, the more suddenly and effectually the cream will rise. The cooler the cellars in which milk is kept, the better. To set milk-pans, made of tin, in beds of salt, would, no doubt, be useful, where the cellar is too warm; and to set all milk vessels on a floor which is constantly covered with cold spring-water, is also an excellent plan; and, where it can be done, ought never to be omitted.

Most of the cream comes last from the cow in milking. The last half-pint of milk that can be got, by milking the cow dry, contains as much cream as the first quart, or perhaps three pints; and, for this reason, cows ought always to be milked as clean as possible. The quantity of cream will also be greater, if the milk of each cow be strained into a pan by itself, as soon as possible. The practice of pouring the milk of the cows together, while milking, and letting the whole stand till nearly cooled, is a very bad one, as in this way, much of the cream will not afterwards rise.

It is said, that any given quantity of milk, having the cream separated by the scalding process we shall describe, yields a fourth more of butter; and it is well known that this cream may be churned into butter in two or three minutes.

The milk is kept twenty-four hours—it is then put into a vessel over a small fire, which should only be sufficient to raise the heat of the milk nearly to boiling, in two hours, not less. When it has been this length of time heating, and begins to exhibit indications of being near boiling, by bubbles rising to the surface, it is to be taken off, and let stand twenty-four hours more. The smallest degree of boiling nears the process.

At the end of this time, the cream will be all on the surface. It is then to be divided into squares, with a knife, and taken off from the milk beneath. This cream will keep much longer, without souring, than cream raised in the common way; and may be, at any time, quickly converted into butter. It may also be salted, and used on bread, or otherwise, without churning.

It is good for coffee, but not for tea; as when put into this liquid, a part of it turns immediately into butter. In London, this cream is considered a great dainty, and, in winter, is sent into that city from a distance of two hundred miles.—*Farmer's Assistant.*

PENNSYLVANIA.

William Penn the founder of this State, in one of his letters to his friend Richard Turner, gives the following account of the origin of the name given to the State.

"5th 1st mo. 1681. This day my country was confirmed to me, under the great seal of England, with large powers and privileges, by the name of Pennsylvania, a name the king would give it, in honor to my father. I chose New Wales, being as this, a pretty healthy country; but Penn, being Welsh for a head, as Penmaenore in Wales, Penrith in Cumberland, and Penn in Buckinghamshire, the highest land in England, called this Pennsylvania, which is the high or head wood land for I proposed, when the secretary, a Welshman, refused to have it called New Wales, Sylvania, and they added Penn to it; and though I much opposed it, and went to the king to have it struck out, and altered; he said, it was passed, and he would take it upon him—nor could twenty guineas move the under secretary to vary the name: for I feared, lest it should be looked upon, as a vanity in me, and not as a respect in the King, as it truly was to my father, whom he often mentions with praise."

A bet of a suit of clothes was recently made that a pair of P. G. Nagle's patent water proof boots, would resist water for 24 hours. A tub was filled with water to the proper height and the boots placed in it, under the inspection of a gentleman in whom both parties had confidence. At the close of the last hour a large concourse of citizens assembled to witness the result. The boots were taken out of the water at the appointed time a piece of paper which had been placed on the inner sole was found perfectly dry, and upon thrusting the hand into the boots not the least feeling of dampness could be discerned. The bet was paid.

Boston and Hudson River Rail Road.—The Engineer for the Western Railway, and one of the Directors, are now engaged in extending the survey which ascends the Westfield River, and along that river to the boundary line of New-York. The portion which lies within New York will be surveyed under the direction of the Commissioners of that State.

REMEDIES FOR INDIGESTION.

In indigestion, two of the most prominent features are flatulency and acidity; and the remedies for these states are clearly indicated. They are the alkalies and magnesia; and the advantages which the latter in the general way possesses over the former, is this: that as containing an alkaline principle, the stomach acidity is neutralized by its administration; and a purgative suit being formed, in some measure, by the combination, the double purpose is thus effected of a corrective and an aperient. A tea spoonful or two of magnesia, thrown into a glass of water, and taken before going to rest, will often anticipate as it were the acid formation in the stomach, which would be otherwise consequent upon a little irregularity of eating or drinking; and will destine the individual to a good, who would pass a restless uncomfortable night.—When a more positive purgative is required, it will be right to combine the sulphate of magnesia (epsom salts) with the carbonate (common magnesia.) Two large tea spoonfuls of the former, with one of the latter, will constitute a good aperient; and for a gouty invalid, one tea spoonful of the fluid carbonate of ammonia (sal volatile) will be found useful; or, if the habit be cold, two or three spoonfuls of tincture of rhubarb may be advantageously mixed with the salts and magnesia.

Unwin on Indigestion.

THE SEASON.

Extract of a Letter, dated Kentville, June 29th, 1828.—The country is looking beautiful; the crops generally promise well—the roots of the grass were somewhat injured by the frost last winter, owing to the scarcity of snow, but as the season has been so wet, but little inconvenience will be experienced from this circumstance. Potatoes are full as forward as is necessary; wheat and oats bid amply to reward the efforts of the farmer; and many fields of Indian corn are highly promising; green peas will be gathered here in a few days; and strawberries are already ripe on the high lands.—*Halifax Recorder.*

From the papers of Mr Titus Smith, published in the Novascotian.

THE RED RASPBERRY.

“The manner in which nature cultivates the common red raspberry, so abundant in this Province, must convince any thinking person that this plant could never have been produced by any co-adjutor of Dr Darwin’s Atoms. This plant, it is well known, thrives only in a very light soil; such a soil it finds in perfection whenever our forests are killed by fire; the raspberry immediately springs up, and bears abundantly for two or three years; the effect of the burning and of the decaying of the fibrous parts of roots being by that time at an end, the soil becomes hard and cold, the raspberry perishes, a young growth of firs, or other trees spring up, and the ground is again covered with a forest, which stands perhaps for more than a century before it is destroyed by another fire, and a proper soil again formed for the raspberry, which would be seen there no more were it not provided with a seed capable of remaining unhurt in the earth, without vegetating, for the length of time that usually occurs between two of these periods. In a grove of spruce, of which many of the trees were two hundred years old, and where, as the soil was very poor, the turf was about a foot thick, I have found near the bottom of the turf, the seeds of raspberries, about

one to every square inch; they were apparently sound on the outside, but not more than one to a hundred had the kernel sound.

SUMACH.

“I have observed in clearing ten or twelve acres of land upon a beech hill, that plants of Sumach appeared in a circle about every fire-place where wood or bushes had been burnt, about one to the square foot; none appeared elsewhere. The largest trees on this hill were about two hundred years old. The Sumach is never seen in an old grove of wood.

THE CHERRY.

“I have observed that a considerable part of the cherry kernels which grow after a fire, had been deposited by mice in small heaps, in situations where they were partially secured from rain. The mice appear also to be the principal agents in supplying our best hardwood hills with raspberry seeds, as these hills are rarely exposed to fires, except after a hurricane, they probably have often stood secure for a longer time than this seed can keep sound; but I have almost always found, upon cutting the hollow branches off a large rotten hearted birch, a considerable quantity either of seeds or shells of the seeds of the raspberry, if there were any growing within a quarter of a mile; they are deposited there by a mouse with a white belly, and very large ears, fringed with white.

“About many of the lakes near Halifax, where the land is but little above the level of the water, there is a remarkable Dyke or Mound along the edge of the lake; it is usually from four to ten feet thick at the base, and rises from two to four feet higher than the land back of it; it is principally composed of stones, and covered with moss and trees; somewhat similar banks on the sea shore would lead to the conjecture that it was the effect of a hurricane, but upon observing the smallness of the lakes, and the size of the stones, it would seem to require a force of wind almost beyond conception. A sample of this may be seen at the south end of Lake Loon, on the Preston Road, about three miles from the Ferry, where such a Dyke extends, according to the best of my recollection, for about half a mile.”

FILTERING MACHINES.

These machines are now so common that they can be had in every town. But it may be worth while to state, that a common five gallon keg may be converted into a good one, thus: Char it inside; make a false bottom three inches from the true one; bore it full of holes; fix your cock between the two bottoms; on the false bottom lay a piece of flannel; on that, a layer of well washed sand, which should be fine and quite clean; let this fill half the tub; on this a layer of powdered charcoal with a piece of flannel to separate it from the sand; on the charcoal, about a third of the space from the top, a leaden cover with an aperture; in the aperture put a piece of sponge; close the lead cover all round the edge with cement, so that no water can pass but through the sponge; it will then percolate, *first*, through the sponge—*second*, through charcoal—*third*, through sand, and is drawn out clear by the cock between the false and true bottoms. The cement may be mortar, or melted wax and sifted brick-dust.

Water kept in well charred casks, will seldom putrify. On board the English men-of-war, it is kept in sheet iron vessels.

Water may also be purified thus: Have ready a strong solution of alum; into a gallon of water, put five grains of pearl or potash, and stir it, then put in about three tea spoonfuls of the solution of alum; it will be beautifully transparent in about four hours, and perfectly wholesome.

For present use filter your water through clean blotting paper in a common glass or tin funnel. *Domes. Ency.*

THORN HEDGES.

I observed in the American Farmer, vol. x. No. 15, the following inquiries which I will endeavor to reply to:

“What is the best kind of thorn for hedges, their cost per rod, where can they be purchased, and what is the best season to plant them?”

I am most in favor of the kind called Washington or Virginia thorn. Ten years ago, having heard a favorable account of this kind of thorn, I planted a hedge about forty rods long, which is now a complete fence against cattle and hogs, without any wooden fence, and is a great ornament to the estate, and with a little attention, will be everlasting.

From the effect of this experiment, Sinclair & Moore, Pratt-street wharf, Baltimore, are raising largely of the quicks of this kind of thorn—and have them two years old, very thrifty, and well grown. Price five dollars per thousand—lower, if many thousand are taken. The quantity necessary per rod may be calculated, allowing them six inches apart in the hedge. The best season for planting is late in the fall, or early in the winter, especially on mellow soils; but early in the spring is also a good time, and best on stiff wet land. The quicks can be also purchased of J. Peirce, near Georgetown, District of Columbia.—*American Farmer.*

Drinking cold water.—Several deaths have been occasioned, at and near Baltimore, by drinking cold water during the hottest part of the day; the consulting physician of the Health Department of that city has communicated to the Board an interesting paper on the subject. The writer, (Doctor Jameson) adopts the suggestions of Dr. Rush, and recommends his mode of treatment in cases of danger. It is mentioned that sudden death seldom ensues from this cause when the thermometer is below 85; and that other liquids, such as beer, punch, or toddy are sometimes equally fatal, when taken while the body is extremely warm. The symptoms are thus described: “In a few minutes after the person has swallowed the water, he is affected by dimness of sight—he staggers in attempting to walk, and unless supported, falls to the ground—he heaves with difficulty, and a rattling is heard in his throat—his extremities become cold, and he dies in four or five minutes.” The only certain remedy, says Dr. Rush, is laudanum;—from a tea spoonful to nearly a table spoonful, administered immediately; and where this is not accessible, a glass of whiskey or brandy may be given.

With due precaution, however, the alarming effects resulting from an immediate draught of cold water may be avoided. Let the drinker first rinse his mouth, and cool his throat by degrees, suffering only a small quantity to pass down at once; or immerse his hands and face. It is the sudden opposition of the internal temperature to that on the surface, in these instances, that occasions spasm, obstruction, and death.—*Bos. Bull.*

From the Lancaster Gazette.

COFFEE.

Amongst the many subjects of investigation, in this age of improvement, we are glad to perceive that those things which contribute their share in strewing the path of life with flowers, and in stealing from care many a moment of our lives, viz.: "those things which are good for the nourishment of the body" receive a due share of attention; but notwithstanding this it is wonderful to perceive how many in these days, despising the light of science, are still content to follow the customs which have been handed down from generation to generation until their origin has become lost in the mist of ages; who never take thought how those things which they are daily preparing for their comfort or luxury could be made better; who go on from day to day in the same path which their grandfathers and grandmothers trod before them and regard any deviation from it as a sacrilege; who denounce every thing that is new only because it is so, and without testing it by experiment.

There is perhaps nothing amongst the luxuries of the table which is so generally spoiled by this negligence or willful ignorance, as coffee, than which, when it is well prepared, nothing is more delicious and refreshing, and when ill managed, more flat and insipid; it is, in fact, as Ben Johnson describes matrimony.

Lake Jeremiah's figs,
When good 's very good indeed,
When bad not fit for pigs.

To the lovers of it then, (and who that has ever tasted its invigorating flavor, is not) every investigation which will lead to any improvement in its preparation, will be interesting; for this reason we hope we shall be pardoned for the length of the following extracts upon this subject.

"If you have ever seen a pot of coffee boiling over a strong fire, you may recollect what a fine odour was spread over the house,—most delightful to the smell, and giving a note of grateful preparation to every eye and palate which may prefer its rich, warm, brown color, to the thin watery appearance of green tea. How woeful, then, must the disappointment be, after all this anticipated enjoyment of a delicious treat, when you find the coffee in your cup—brown enough indeed, and thick enough,—but tasteless, mawkish, and weak; the flavor and spirit all gone, and nothing remaining of the real stuff, save the shadow, which mocks the lip and palate with "mereal seeming," a flat, flavorless, "baseless fabric of a vision;" the very corpse of a cup of good coffee—more likely to plunge you deeper in drowsiness than to stir you up into renewed life.

It would be very hard, however, to blame the coffee, if you spoil it in the making—and the best coffee that ever grew in Arabia and Berbeece, will be totally spoiled if you are barbarous enough to boil it. Think for a moment, and common sense will tell you that the fine odour floating in the air, all over the house, must have come from the coffee, and you could not have the conscience to expect an odour in a coffee and flavor in your cup at the same time. In every way, the best parts of the coffee, namely its fine strong flavor, and sleep-banishing aroma, are so spirited and airy that boiling drives them off instantly, and what remains in the pot is the mere dregs and refuse—heavy, heartless and thick—fit only to be thrown to the pigs or the dunghill.

We dislike all dogmatism, and ask you not to take this on trust; we have no wish to set up our authority in opposition to facts. Try it and learn wisdom by experiment and experience. It would be better, indeed, to give your hard earned pence to the poor, than thus to waste them on the thankless air, by filling it with all the strongest and best parts of your coffee, and leaving only "the ghost of vanished sweets," for your own particular use.

But if we are not to boil our coffee, because it wastes all the best of it, "what," you will ask, "are we then to do?" You recollect that the doctor, who was asked a similar question, replied, "Take advice." So say we. Be advised by us, and you will have excellent coffee, at least for one half the expense of those who foolishly boil it.

In the first place, then, you must buy a Rumford coffee pot, or *biggin*, with strainers in it; and if you cannot afford five, six, or seven shillings for this you must give up the idea of coffee till you can; for it cannot be made either good or cheap without. You will lose more money in a few weeks, by boiling your coffee, and wasting it in the air, than would buy you such a pot, which would last you for years. Your coffee is to be put into the upper strainer, boiling water poured over it, and as soon as it has run through, it is ready. If you do this rightly, it ought to be as clear and high-coloured as brandy, and of a fine strong flavour; that is supposing you use a mixture of one half Mocha or Turkey coffee, and one half Berbeece or Bourbon, which is better than either singly. You must not forget, also, to boil the milk (or cream if you have it) which you put with your coffee, for cold milk or cream will spoil the best coffee ever prepared.

"The roasting of the berry to a proper degree, requires great nicety. If it be underdone, its virtues will not be imparted, and in use it will load and oppress the stomach; if it be overdone, it will yield a flat, burnt, and bitter taste; its virtues will be destroyed, and in use it will heat the body, and act as an astringent. The closer it is confined at the time of roasting, and till used, the better will its volatile pungency, flavor, and virtues, be preserved.

"The influence which coffee, judiciously prepared, imparts to the stomach, from its invigorating qualities, is strongly exemplified by the immediate effect produced on taking it when the stomach is overloaded with food, or nauseated with surfeit, or debilitated by intemperance, or languid from inaction.

"Du Four relates an extraordinary instance of the effect of coffee in the gout; he says, Mons. Desprez was attacked with the gout at twenty five years of age and had it severely until he was upwards of fifty, with chalk stones in the joints of his hands and feet; he was recommended the use of coffee, which he adopted, and had no return of the gout.

"A small cup or two of coffee immediately after dinner promotes digestion.

"With a draught of water previously drunk, according to the eastern custom, coffee is serviceable to those who are of a custive habit."

"The generality of the English families make their coffee too weak, and use too much sugar, which often causes it to turn acid on the stomach. Almost every housekeeper has a peculiar method of making coffee, but it never can be excellent, unless it be strong of the berry, any more than our English wines can be good, so long as we contin-

ue to form the principal of them on sugar and water.

Count Rumford says, "coffee may be too bitter, but it is impossible that it should ever be too fragrant. The very smell of it is reviving, and has often been found to be useful to sick persons, and to those who are afflicted with the head-ache. In short, every thing proves that the volatile, aromatic matter, whatever it may be, that gives flavor to coffee, is what is most valuable in it, and should be preserved with the greatest care, and that in estimating the strength or richness of that beverage, its fragrance should be much more attended to, than either its bitterness or astringency. This aromatic substance which is supposed to be oil, is extremely volatile, and escapes into the air with great facility, and is observed by its filling the room with its fragrance, if suffered to remain unevaporated, and at the same time losing much of its flavor."

Phillips' History of Vegetables.

NEW EDITION OF CLEVELAND'S MINERALOGY.

Prof. Cleveland, of Bowdoin College, is preparing a third edition of his valuable work on Mineralogy and Geology. This indicates a steady progress in the interesting science of which the book treats. The mineral riches of a country are of vast importance to its prosperity. To be of the greatest use, however, they must be thoroughly known; this can be effected, but by a strict attention to the science which describes them, and a proper consideration of the particular items which serve to make up the whole. Prof. C. is desirous of obtaining all the localities not described in his last edition. A letter from him says—

"I wish to connect with the account of the Locality some brief Geological notice, viz: whether the mineral occurs in veins, or in beds, or is disseminated—the associated minerals—and the rock which contains them. In most cases, the form, structure, and prevailing colour of the mineral may be mentioned.

"I also wish to obtain as accurate information, as possible, in regard to all minerals explored for useful or ornamental purposes, such as Nitre, Common Salt, Marble, Marl, Gypsum, Precious Stones, Steatite, Roof Slate, Clays, Pigments, Anthracite, Graphite, Coal, Ores of the metals, Porphyry, &c. and also certain articles manufactured from minerals, such as Alum, Copperas, Chromate of Lead, &c. The quantity of the aforementioned substances annually obtained or manufactured, the quality including the per cent. of metal yielded by ores, and the price are particularly requested. I am desirous, that the localities should be so described, that they may be found without difficulty. In addition to the name of the town, a few words, referring the locality to some point or object, well known in that vicinity, will be sufficient."—*New England Farmer's and Mechanic's Journal.*

Boston. Museum Gallery.—This interesting and popular Exhibition closed on Tuesday last. The season tickets sold amounted to 5133. The entire receipts of the season to over \$3800. The expenses have been short of \$1000.—*Continued.*

The Corporation of Baltimore have laid a duty on Dogs—two dollars on every male, and ten on every female. They have also forbidden all persons to bring dogs into the market place, during market hours. The latter strikes us as an excellent provision.

NEW SPECIES OF PINE.

Mr Douglas writes: "I rejoice to tell you of a new species of *Pinus*, the most princely of the genus, and probably the finest specimen of American vegetation. It attains the enormous size of from 170 to 220 feet in height, and from 20 to 50 in circumference. The cones are from 12 to 18 inches long! I have one which is 16½ inches in length, and which measures 10 inches round the thickest part. The trunk is remarkably straight, and destitute of branches till within a short space of the top, which forms a perfect umbrella. The wood is of fine quality, and yields a large portion of resin. Growing trees of this species, that have been partly burned by the natives, to save the trouble of cutting other fuel, (a custom to which they are greatly addicted,) produce a substance, which, I am almost afraid to say, is sugar; but as some of it, with the cones, will soon reach England, its real nature can be easily and correctly ascertained. The tree grows abundantly 2° south of Columbia, in the country inhabited by the Umpiquin tribe of Indians. The seeds are gathered by the natives in autumn, pounded and baked into a sort of cake, which is considered a luxury. The saccharine substance is used in seasoning dishes, in the same manner as sugar is in civilized countries. I shall bring home such an assemblage of specimens of this *Pinus*, as will admit of a very correct figure being made, and also a bag of its seeds."—*Brucester's Journal*.

LARGE GEESE.

We yesterday saw in a wagon a pair of young geese, raised by James Sisson, Esq. of Warren, of very large size, being now only three months old. The breed was imported from East-Friesland last fall, in the ship *North America*. Capt. Child, who asserts that these geese frequently grow to upwards of twenty pounds, dressed. They are very full of soft fine feathers, which is an article of exportation from that country, and very much sought for in Germany, Holland, and England. These geese are the first of this breed which has ever been imported into the United States, were brought especially for Mr. Sisson, and are well worthy the attention of the lovers of good eating. Mr. Sisson has a few pairs on hand, which he will dispose of at \$12 the pair—and will send them to any part of the country he may be directed.—*Prov. Pat.*

The following is extracted from the London *New Monthly Magazine* for March, under the head of Useful Arts.

Glue made water proof.—A correspondent informs us that he has succeeded in making a Glue perfectly water proof, and having the property, also of drying almost immediately after its application. His method, we learn, is first to immerse common glue in cold water until it becomes perfectly soft, yet retaining its original form; after which it is to be dissolved in common raw linseed oil, assisted by a gentle heat until it becomes entirely taken up by the latter. After which it may be applied to substances for adhesion to each other, in the way common glue is ordinarily applied. It dries almost immediately, and water will exert no action on it. It is unnecessary to say in how many valuable purposes in the arts this application may be used. For cabinet makers it is important, as mahogany veneers, when glued with this substance, will never fall off by exposure to a moist atmosphere. In ship building it will probably answer a

valuable purpose, as it has infinitely more tenacity than common glue, and becomes impervious to water."

Note.—The author might further have adverted to the advantage arising to Hatters from the discovery, but this is obvious.

On Tuesday the 8th inst. a stroke of lightning descended upon the eastern wing of the Tontine Coffee-house, in New Haven, breaking through the roof, and making its way through the upper tier of rooms, leaping from nails to wires, and marking the intervals by rents in the plastered walls, until it made its exit through the opposite side of the building. Several persons were slightly benumbed, and others stunned by the shock.—There are three lightning rods rising several feet above three of the chimneys on this building, and it is matter of speculation and wonder among many that the electric fluid should break through the roof within seven or eight feet of one of the lightning rods. Some gentlemen of much study and observation, contend that in this instance the electricity was conducted to the roof by the steam and smoke which was heating down upon the roof after it had risen several feet above the top of the chimney. It is a fact that the lightning struck the roof near the kitchen chimney—and that there was a powerful fire in the kitchen below at the time.—*New Haven Reg.*

Vegetable Inoculation.—It is mentioned in the London *Mechanics' Magazine*, that there is a blotched-leaved variety of the English laburnum, a bud of which being inserted in the bark of the common laburnum, it has invariably the effect (whether the bud lives or not) of making the leaves of the latter blotched, like the parent stock of the bud. "It" says Mr. Falla, "the blotched or striped leaves of the plants arise, as I think is generally admitted, from a disease, this may justly be considered as virulent a disorder in the vegetable world, as the small-pox is in the human race, and this operation may very fairly be said to be inoculation."

A Marriage Tree, generally of the pine kind, is planted in the church yard by every new married couple in the parish of Varallo Pombio, in the Tyrol: a fine grove of pines is said to shade this church yard, and it must be recollected that the pine of the Tyrol claims to be ranked as a fruit tree, as well as valuable timber, being the *Pinus pinea*, the kernels of the cones of which are frequently served up in the desert in Italy, and the Southern Alps, as almonds and nuts are in England.—*Gar. Mag.*

State of Education in Lower Canada.—The petitions presented to parliament from the Canadas complaining of the Administration of the Earl of DALHOUSIE, contained the names of 78,000 persons, of which only nine thousand are signatures, the other 78,000 having his Z mark attached to them. The population of Lower Canada is 450,000 French to 80,000 British. Only one in eight of the former are taught to write.

We are ruined, not by what we really want, but by what we think we do: therefore, never go abroad in search of your wants—if they be real wants they will come in search of you—for he that buys what he does not want, will soon want what he cannot buy.

From Members of the New York Board of Agriculture.

ON LIMING SEED WHEAT.

Sir,—In answer to your inquiry on the subject of sowing in wheat, I will state to you what has fallen under my observation.

When I resided in Seneca county, several years ago, my attention was particularly drawn to this subject, by observing that while myself and neighbors were much injured by smut in our wheat, the crops of Mr. C. uniformly escaped. I enquired into the cause of this singular exemption, and learnt that it was owing to the seed having been limed. In 1816, therefore, I washed my seed, pat about three pints of lime to each bushel, mixed it well, and let it lie in a heap twelve hours before sowing. My crop was perfectly clean, while I can say all my neighbors had more or less smut.

In 1817, part of my seed was washed and limed, as in the preceding year; another part was washed and limed, and a part of salt to each bushel mixed with the lime; a 3d parcel was washed in strong pickle and limed; a 4th sown without any preparation. The result was as follows: The first had a little smut, the second none, the third none—and the fourth was a quarter smut—all on the same kind of land, and all sown in good weather, between the 5th and 15th September.

In 1819, Mr. L. bought his seed of my neighbors Mr. B. and Mr. G. and of myself, and sowed all without preparation. Mr. G's crop was from a 3d kind of seed the year before, and sowed without liming. B. had never prepared his seed by any process. It was found on harvesting the crop that the part sown with my seed was free from smut,—that sown with G's seed had a little,—and that sown with B's seed was one fourth smut.—This statement I had from Mr. L. I mention this circumstance to show that seed wheat well cleaned, as mentioned, will have an effect for two or three crops; but I would never recommend to sow wheat without salt and lime.

As the Hessian fly has never yet troubled us in Albany, I am unable to speak of the efficacy of preventing the ravages of that insect.

I beg leave to suggest to farmers, the propriety of spreading their straw upon their pasture grounds, either in spring or fall. It will shield the ground from the extreme cold which often breaks the fibrous roots of the grasses. In summer it shields the ground from the scorching rays of the sun, prevents the evaporation of moisture, fertilizes the soil, and causes a strong rich sward; and when ploughed, will be equal to a good coat of manure. JAMES McCALL.

DISEASES OF VINES.

When you see a vine unhealthy, by the leaves becoming yellow, or other sickly appearances, remove immediately the earth from about the roots, and fill up the space with a compost made of lime, ashes, or cowdung, and virgin earth from the woods, well incorporated, and water the ground well. Sometimes the leaves turn yellow, and the vine seems otherwise diseased by there being too many grapes on it. If you wish to preserve your vine, remove the grapes or cut down the branches to near the ground, leaving one or two young ones, and manage and manure it as above directed.—There ought to be a compost heap at every vineyard to manure any vines that may dwindle or not grow vigorously.—*Althua's Treatise*.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 18, 1828.

CLOSE OF THE SIXTH VOLUME.

The present number completes the sixth volume of our paper, and brings us to the termination of six years since the commencement of our labors as Editor of the New England Farmer. We hope that our exertions have been of some service to the community, and are induced to believe that they have been estimated as possessing some value from the constant, though not rapid accession to our subscription list, which continues to attend the progress of our publication. We would take this opportunity to make our general, but grateful acknowledgements to those contributors to our columns, to whom we are indebted for the most valuable parts of our paper, (being generally details and results of the experience of intelligent cultivators) and would solicit the continuance of their favors.

It is not necessary to observe that the close of a volume presents a favorable time for the settlement of accounts, at the Farmer office—paying what is due, and saving somewhat by an anticipated payment of the next volume. It is true, however, that money, though neither the main-spring, nor the main object of our pursuits, is what rhetoricians call a *sine que non*, or thing indispensable to the existence of our establishment.

PRUNING TREES.

In Loudon's Encyclopedia of Agriculture, Kalendarial Index for July, it is remarked that "this season [viz. July] answers perfectly well for pruning all sorts of trees, and if their leaves and sprays were an object for fodder, as in Sweden and Italy, no doubt it would be preferred. Wounds in trees do not now bleed as they sometimes do in spring and autumn, and they heal and are in part covered with bark before the approach of winter." A scientific friend of the Editor, who is likewise a practical horticulturist, assures us that he has found by experience that the month of July is much the most favorable time for pruning grape vines &c. at this season large branches may be cut off, and the vines will not bleed in the least. It may, therefore, not be ill timed to offer a few remarks on this important branch of arboriculture.

Mr Knight in his excellent "Treatise on the Culture of the Apple and Pear," has given the following directions. "In pruning the apple tree and all other standard trees, the points of the external branches should be every where rendered thin and pervious to the light; so that the internal parts of the tree may not be wholly shaded by the external parts. The light should penetrate deeply into the tree on every side, but not any where through it. When the pruner has judiciously exerted his work, every part of the tree, internal as well as external, will be productive of fruit; and the internal part, in unfavorable seasons, will rather receive protection than injury from the external. A tree, thus pruned, will not only produce much more fruit, but will also be able to support a heavier load of it, with in danger of being broken; for any given weight will depress the branch, not simply in proportion to its quantity, but in the compound proportion of its quantity, and its horizontal distance from the point of sus-pension, by a mode of action similar to that of the weight of the beam of the steelyard; and hence a hundred and

fifty pounds, suspended at one foot distance from the trunk will distress the branch, which supports it, no more than ten pounds at fifteen feet distance would do. Every tree will, therefore, support a larger weight of fruit without danger of being broken, in proportion as the parts of such weight are made to approach nearer to its centre.

"Each variety of the apple tree has its own peculiar form of growth; and this it will ultimately assume, in a considerable degree, in defiance of the art of the pruner. Something may nevertheless be done to correct whatever is defective. When the growth of any variety is weak and reclining, the principal stem should be trained to a considerable height, before it be allowed to produce branches; and if any of these take a horizontal or pendent direction, they should be regularly taken off. One principal leading stem should be encouraged almost to the summit of the tree, to prevent a sudden division into two large boughs of nearly equal strength; for the fork which these form is apt to divide and break, when the branches are loaded with fruit. All efforts to give young trees a round and regularly spreading form, whilst in the nursery, will be found injurious in the future stages of their growth. Large branches should rarely or never be amputated."

If, however, pruning is commenced at a proper stage of the growth of the tree, and properly and seasonably attended to, it will rarely be necessary to take off a large limb, and small ones, if cut close and smooth, may be taken off at any season. See N. E. Farmer, vol. iii. page 273.

EXCELLENT ARTICLES.

We have received a quantity of OAT FLOUR, very white, fine, and sweet, and very palatable as well as wholesome for puddings, gruel, &c. Likewise groats and oatmeal of superior quality, all raised and manufactured by Mr STEVENS, of Barnet, Vermont. These articles have been highly approved of by several druggists in this city, by Dr KIDDER of Charlestown, and other qualified judges, who pronounce them to be preferable to any thing of a similar nature imported. They appear to contain more mucilaginous, and less bitter extractive matter than the common preparations from oats, found in the shops of druggists and grocers.

THE NEW AMERICAN GARDENER.

A work with this title, compiled by the Editor of the New England Farmer, with the assistance of a number of scientific and practical Horticulturalists in the vicinity of Boston and New York, will be published by J. B. RUSSELL, Proprietor of the New England Farmer, in the course of the ensuing week. The articles are arranged alphabetically, and comprise the most useful VEGETABLES and FRUITS which can be conveniently and economically cultivated in the climate of New England, and the Middle States; as well as a Treatise on FLOWERS, and on LANDSCAPE or PICTURESQUE GARDENS, on the general management of the SILK WORM, and the manufacture of SILK, and a treatise on the culture of GRAPE VINES and the STRAWBERRY.—The article on Fruit Trees contains an enumeration and description of all the Apples, Pears, Peaches, Cherries, Plums, Nectarines, Apricots, &c. that can be raised to the most advantage, and their relative forwardness in bearing, which will be found to be of incalculable benefit to gentlemen in laying out orchards. Each of the above articles is furnished by gentlemen practically ac-

quainted with the subjects on which they have written.

The following is the General Index of the book, which is superadded to a Calendrical Index, giving directions for performing the work of all the months in the year as they follow in succession.

Apple	Eleanthane	Mulberry
Apple tree	Egripe	Mustard
Apricot	Epialers	Mustard
Artichoke	FLOWERS, ORNA- } Nursery	Nectarine
Asparagus	FLOWERS, ORNA- } Nursery	Oak
Balm	MENTAL	Oak

Dibble	Love apple	Teasel
Dill	Madder	Thyme
Drains	Mangel Wurtzel	Tomato
Duck	Marjoram	Turnip
Egg plant	Melou	VINE.
Elder	Mint	

The work is handsomely printed, making a volume of 312 pages,—price \$1.25.

Vegetables.—Hartlib, (the friend of Milton) pensioned by Cromwell for his agricultural writings, says, "that old men in his days remembered the first gardeners that came over to Surrey, England, and sold turnips, carrots, parsnips, early peas, and rape, which were then great rarities, being imported from Holland. Cherries and hops were first planted in the reign of Henry 8th; artichokes and currants made their appearance in the time of Elizabeth; but even at the end of this latter period cherries were brought from Flanders—onions, saffron, and liquorice, from Spain, and hops from the low countries. Potatoes, which were first known in England about the year 1586, continued for nearly a century to be cultivated in gardens as a curious exotic, and furnished a luxury only for tables of the richest persons in the kingdom." It appears in a manuscript account of the household expenses of Queen Anne, wife of James 1st, that the price of potato was then 1s. the pound.

Good income.—The receipts of the New Hampshire State Prison during the year exceeded the expenditures \$415,60 cents. The amount of earnings over the ordinary expenses is estimated at \$24,79.

Sale of Saxony Wool.—The sale of Saxony sheep on the 9th, at Brighton, was not so profitable as some of the preceding sales, on account of the same owners. The whole flock, consisting of 210 was sold. The lowest price at which any animal went off, was \$15—the highest, 135. Mr. S. P.

Dexter, formerly of this city, now residing at Whitesborough, N. Y. near Utica, we understand was the largest purchaser.—*Boston Courier.*

BLAIMING.

We are no friends to the system of docking and nicking of horses, dogs or cats. To clip off at one "fell swoop" five or six inches of the *vertebre* is, in our opinion, an act of cruelty, and deserves the severest reprehension. Nature created a horse, a dog, and a cat with a long tail, and in doing which evidenced her taste and judgment, and to mend her perfect work is nothing but a ridiculous and barbarous custom. The Berkshire American has an article upon this subject. The editor is speaking of the curtailing of dogs, and says:—(*Bellows Falls paper.*)

"No sooner does a man bring home a puppy, than he falls foul of the poor creature at both ends—paring his ears nearly to his head, and leaving him too little tail to express his gratitude (for this *mending* him!) by wagging it. And this he does, as he says, to make the dog look *fierce* and savage. And in fact, he not only succeeds in giving him a ferocious appearance, but in souring his temper for life; for the animal being, without any provocation, thus murderously treated, and divested of his fair proportions, become a misanthrope, instead of the good natured, friendly and affectionate creature he is always found to be when properly treated."

Sugar.—The manufacture of sugar from the beet, continues to flourish in France. It is stated that there are more than sixty manufactories for the purpose in that country. Three establishments of the kind were recently formed on a large scale.—*N. Y. Journ. of Com.*

Toads.—We are wont to regard the toad as noxious and useless, but it is because we do not observe the important uses which it serves in the animal economy. We lately noticed one of these creatures bloated to an enormous size, which had been feasting upon ants. Toads likewise devour flies.—*Salem Observer.*

There is now in our office, (says the Trenton True American) a branch of rye, raised on the farm of Mr. Hunt, in this vicinity, containing forty stocks, of five feet six inches high, with each a large ear, all proceeding from one root, and the production of a single grain, exhibiting a most astonishing increase.

Long Wool.—A man in New Jersey has a sheep of the Dishley breed, which weighs 252 pounds;—some of the wool is 20 inches in length. A man in Pennsylvania, lately sheared 23 pounds of wool from one sheep; it is very fine, and some of it 12 inches long, (probably the growth of two or three years.)

Valuable Discovery.—An ingenious tradesman at Falkirk, has discovered a method by which he can make skins and leather to any shape, and make very elegant light summer hats of sheep-skin, weighing 2 or 3 oz. varnished and rendered impervious to wet. He likewise makes them of seal skin with the hair on. Entire dresses, consisting of a jacket and trousers, have been furnished to various ships' companies, at so low a rate as 15s each. They are of leather, dressed after a method which renders them impervious to rain, and yet as pliant as a glove.

We are happy to state, (says the New Brunswick Gazette) that, notwithstanding the backwardness of the season, the crops in general wear an encouraging aspect; and it is highly deserving of notice, that the farmers throughout this part of the country have given evidence of their lively attention to the recommendation of last year, of the tea wheat, by having sown as much of that fine grain as circumstances would admit of.

In Charleston, S. C. there is a permanent and splendid Ice House, which has cost 15,000 dollars, is capable of containing the cargoes of four large ships; and notwithstanding the failure of the late winter in the north, it has been supplied with four cargoes of lesser size but quite enough for any possible demand.

Subscribers to the New England Farmer, are earnestly desired to settle all arrearages, either by remitting by mail, to the publisher in Boston, or by paying to either of the following Agents. Any who may wish to discontinue the paper, are desired to give immediate notice to the publisher.—Gentlemen who contemplate subscribing to the paper are reminded that the present is a favorable opportunity, as the next number will begin the 7th volume, which will be printed on new type, and no efforts will be spared by the Editor or Publisher, to make it at least equal to any volume that has preceded it.

Bangor, G. W. Brown.	Providence, Hugh Brown.
Castine, M. Chamberlain.	Hartford, Goodwin & Sons.

TO CORRESPONDENTS.—An article from *Danvers on the Conker Worm*—one from *New York on some new English stock*—from *Salem on Haying*—on the *Staggers in Swine*—on *Apple Orchards and Cider*—on the *Conker Worm*—and one from *Plymouth on the manufacture of Soda from Sea Wood*, will have an early insertion; most of them having been received too late for this week's paper.

Farm Stock.

A good black cow, four years old, with a calf; a superior milk, both as to quantity, and quality. Reference may be had to Col. Jaques. Price \$10.—Inquire at the New England Farmer Seed Store. Also, 10 pair of Bremen Geese.

Bull Call for Sale.

For Sale, a beautiful Bull Calf by Admiral, a very desirable animal for those who feel interested in the improvement of our breed of Stock.—Apply to Maj. Jaques of Charleston, where he may be seen. 3t. July, 18.

German Geese.

For sale two pairs of this superior breed of Geese, from East Friesland, Germany—produced from a pair imported last year direct from Bremen, by ship North America, Capt. Child; and which were selected by said Capt. himself with the greatest care. These geese possess many important qualities peculiar to their breed—among which is, their size, their usual weight when fat being from 25 to 30 pounds each—also the large quantity of feathers which they yield, the Germans pluck them three times a year, and the feathers are considered the best in the German, English and Dutch markets—and their remarkable docile, gentle and domestic dispositions. Apply to Capt. S. P. Child, Warren, R. I. where the geese are to be seen—or to Wm. B. Bradford, Jr. No 24 India street, head of Central wharf, Boston—or to the New England Farmer Seed Store. July 18 3t

Massachusetts Agricultural Repository.

Just published by Welles & Lilly, Corn Street, Boston, price 50 cts, the Massachusetts Agricultural Repository and Journal, Number 2 vol. x. Contents:—The Proceedings and Reports of the Brighton Cattle Show in October 1827—The culture of Silk—History of Silk—History of Silk in the United States—Rare Pictures had for Milch Cows—One of the Diseases of the Peach Tree—Lurain's Husbandry—New Presents of Fruits.

Barfoot and Scrab.

These two valuable animals, which have been sent to this country by Admiral Sir Isaac Collins, will, for the present season, stand at Brighton.—They are young, and have been highly celebrated in England. The pedigree of Barfoot, a chestnut horse, is as follows.

FOALED 1820.

Barfoot, by Trump, dam Rosebud, by Harzard, out of Mrs. Westby, sister to Dibley and Tantar, by Phenomenon, out of Ross, West by Marazion—Regulus—Crab—Chadders—Laid. In 1822, when at Ponceaer, sweepstakes of 20 gs. each, for two years old—11 sibs. Barfoot beating Harpooner. In 1823, York Stakes, St. Ledger, of 25 gs. each, 6 sibs.—Barfoot beating four others.—A. V. Ponceaer's stakes of 20 guineas each, 1st, 10 subscribers. Barfoot beating Harpooner.

In 1825, the Lancaster great St. Ledgers, of 25 gs. each, 30 subscribers. Barfoot beating 11 others.

In 1824, at New Market, Barfoot won a handicap plate value £50, beating Treddish and five others.

In 1824, at Acot Heath, Barfoot walked over for the Swinback stakes, of 25 sovereigns each, 3 sibs.

In 1825, at Lancaster, the gold cup, value 10 gs. added to a sweepstakes of 13 sovereigns, 17 sibs., of all ages. Barfoot beating Letty and two others.

In 1826, at Manchester, Handicap stakes of 30 sovereigns each, 10 sibs, with 20 sovereigns added—subscribers—Barfoot beating two others. At Lancaster, the gold cup, value 100 gs. added to a sweepstakes of 10 sovereigns each, 9 sibs.—Barfoot beating two others.

FOALED IN 1821.

Got by Phenaton out of Jesse, by Tetteridge—her dam Cracker by Highlyer, out of Nutcracker, by Mateum.

In 1824, won the New Market stakes, 50 gs. each 21 sibs.—Scrab beating four others.

In 1825, at the New Market Crane meeting, the stakes, 100 sovs. 7 sibs. Scrab beating two others. The same year, Spring meeting, Scrab won Handicap sweepstakes, 100 sovs. 5 sibs, beating three others.

In 1825, Scrab won Kings Plate, 100 gs. beating 30 others.

In 1827, Stocton, Scrab won the gold cup. j.13

MISCELLANIES.

THE MARRIAGE SCENE.

[BY MONTGOMERY.]

Young, chaste, and lovely—pleas'd, yet half afraid,
Before you alter drops a pignit mood,
Clad in her bridal robe of faintless white,
Dumb with the scene and trepid with delight
Around her symmetrical garbious stam;
Each with a tender look and feeling bland;
And not she turns her beauty-beaming eye,
Dumb'd with a tear of happiness gone by!
Then early views, in youth's commanding pride,
Her own adored one panning by her side;
Like lilies bending from the moon tide-blaze,
Her bashful eye-lids droop beneath his gaze;
White love and homage blend their blisful power,
And shed a halo round his marriage hour;
What though his chance attending life ordain
A path of anguish and precarious pain;
I y wane or woe, whate'er compell'd he rove,
A cot's a palace by the light of love!
There lies one heart which, mild death, will be
Agnishing, glowing from sympathy;
One fearless eye to banish with his own,
One clings-like friend when other friends are flown;
O! sanction Th, u the love-mated pair,
Fountain of love! for Thou art great there!"

David Garrick was once on a visit to a Mr. Rigby's seat, Ministry Hall, Essex, when Doctor Gouge formed one of the party. Observing the potent appetite of the learned Doctor, Garrick indulged in some coarse jests on the occasion, to the great amusement of the company—the Doctor excepted; who, when the laugh had subsided, thus addressed the party: "Gentlemen, you must doubtless suppose, from the extreme familiarity with which Mr. Garrick has thought fit to treat me, that I am an acquaintance of his; but I can assure you, that till I met him here I never saw him; but once before, and then I paid five shillings for the sight." Roseins was silent.

A downright Appeal—not a Hint.—We have seen a paragraph, taken from a Southern paper, and which is now travelling itself to death as fast as it can, stating that a gentleman lately deceased in Carolina, had never permitted his subscription to the newspaper to be behind, and that as the same could be said of so few men, is worth recording in his tomb stone. Verily, we say amen to this. This man stands next to him who returned a borrowed umbrella! What higher praise can there be, than have your printer say, "You always put me." How clear, too, must be the man's conscience who reads a paper he knows he has paid for. With what enviable satisfaction does he unfold the damp sheet! He feels himself under no obligation, that the printer is absolutely beholden to him. This is the very feeling we would! have all our subscribers experience—that we are in debt to them for a year's paper—but that they are in debt to us. Now think not, gentle readers—you that have patiently followed us thus far—that there is any hint in this—not any. It is too plain for a hint—it is a downright appeal—but whether to your pity or your pockets, we shall wait an answer by the return of mail.—Truth-Teller.

An Instance of Pathos, not found in Martial's Scribbles.—The following oration to an eloquent harangue addressed by a lawyer in Ohio, to a jury, is a rare specimen of eloquent sublimity. "And now the shades of night had shrouded the earth in darkness. All nature by wrapped in sel-

lorn thought, when these defendant ruffians came rushing like a mighty torrent from the hills down upon the abodes of peace—broke open the plaintiff's door—separated the weeping mother from her screaming infant—and took away my client's rice, gentlemen of the jury, for which we charge fifteen dollars.

The wise man has his follies no less than the fool; but it has been said, that herein lies the difference, the follies of the fool are known to the world, but are hidden from himself; the follies of the wise man are known to himself, but hidden from the world. A harmless hilarity, and a buoyant cheerfulness are not unfrequent concomitants of genius; and we are never more deceived, than when we mistake gravity for greatness, solemnity for science, and pomposity for erudition.

Ancient Coins.—Mr. Stodder offers for sale a very valuable collection of antique Coins, which we understand belong to Mr. Purdie, a gentleman who has travelled through Greece, Asia Minor, and many of the principal cities of the eastern world, and who makes a short stay in this town, previous to his embarkation for Turkey.

Mr. P. has visited all the principal places where the Coins formerly circulated—being about 800 different varieties, some of them nearly 3000 years old, and undoubtedly the most valuable collection in the United States. Among them are many Egyptian and Roman coins, scarce and rare.—*Prosp. paper.*

Cultivation of flowers.—The cultivation of flowers is it is one of the most pleasing employments, so it is one of the most profitable. We do not mean profitable in dollars and cents, but profitable in its operation up on the habits of the world. The great purveyor of vice and the mightiest enemy of virtue is idleness. Want of employment takes men from their homes and causes them to loiter about taverns and gaming shops. The same cause sends women from their families to spin street-yarn, and retail small scandal against their neighbors, who it is probable are better than themselves. What was at first done for want of occupation, at length becomes an inveterate habit, and the man cannot refrain from haunting the tavern, or the woman from flouting through the streets. Learn your children to love the garden and to rear flowers. It will prove an useful exercise, and an agreeable amusement. When they once acquire a fondness for such simple pleasures, it will never be lost. Through life a part of their leisure hours will be devoted to these innocent pursuits. The man who seizes every opportunity to look to his garden, his shrub, his flowers, and his trees, will rarely be found to be dissipated. The best society for the suppression of vice, would be one whose object was to encourage constant employment and innocent and agreeable amusements. There are various other sources of pleasure, where labor and amusements go hand in hand, that should be made fashionable.—*National Standard.*

Disparity of Intellect and March of Mind.—The difference between one man and another is by no means so great as the superstitious crowd suppose. But the same feelings which, in ancient Rome, produced the apotheosis of a popular emperor, and in modern Rome the canonization of a devout priest, lead men to cherish an illusion

which furnishes them with something to adore.— Society indeed has its great men and its little men, as the earth has its mountains and its valleys. But the inequalities of intellect, like the inequalities of the surface of our globe, bear so small a proportion to the mass, that, in calculating its great revolutions, they may safely be neglected. The sun illuminates the hills, while it is still below the horizon; and truth is discovered by the highest minds a little before it becomes manifest to the multitude. This is the extent of their superiority. They are the first to catch and reflect a light, which, without their assistance, must in a short time be visible to those who lie far beneath them.

Turnip Seed, &c.

Just received at the New England Farmer Seed Store, No 52 North Market Street, Boston, an extensive assortment of Turnip Seeds, some of which are the growth of the present season—the finest sorts either for family use or stock. The most improved sorts for the former are the White Stone, White Dutch, Yellow Stone, Yellow Malta. The Yellow Stone is one of uncommon excellence and keeps well. Of the sorts for field culture, the White Norfolk, White Globe, and Yellow Aberdeen or Bullock are preferable. The Yellow Aberdeen is most approved among the farmers of England and Scotland, as it grows to a large size, is very sweet and nutritious, and keeps till June. Also, Yellow Ruta Baga, or Russian Turnip, of the best description. The above seeds were saved in Europe expressly for us, and the utmost dependence may be placed upon their genuine quality. A variety of Long and Turnip Radishes, suitable for growing in the three ensuing months. Treckly or Fat Turnip, Long Treckly and Early Cluster Cucumber, also the genuine Girdler Cucumber, or West India pickling one of the finest pickles.

Likewise 200 lbs. fresh common white flat English Turnip Seed, a part of it of B23 —to dealers and purchasers by the quantity, it will be put at a low rate.

Also, genuine Fowl Mexican, Green from Vermont—Orchard Green, Luccerne, &c.—Hemp, White Mustard, Flax Seed, &c. At this place is kept the best supply of seeds, native and imported, that art and industry can procure. July 4.

Roman.

This elegant, full blooded horse, a bright bay with black legs, mane and tail, of high spirit and good temper, will stand in the form of Mr. Stephen Water, of Hallowborough, Ms. at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, May 16.

Out Meal, Out Flour, Groats, &c.

Just received at the New England Farmer Seed Store, a further supply of the above articles, viz. 30 barrels of fresh Out Meal, of the best quality, of the best quality, of the best quality, Scotch Barley, &c. for sale in any quantities, wholesale or retail. Also a few canisters of fine Out Flour, neatly packed, at 50 cts. per canister.

Seeds for the West Indies.

Merchants, masters of vessels and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$7 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.— Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of B27.

Bremen Geese.

For sale, 10 pair fine Bremen Geese. Apply at the New England Farmer Seed Store. July 4.

Cucumber Seed, &c.

Just received at the New England Farmer Seed Store, a further supply of Green and White Turkey, White Spanish, Long Treckly, and small Cluster Cucumber Seeds.—The latter is a fine sort for pickling, and should be planted soon.

Salts.

At the New England Farmer Seed Store, "A Memoir of the Cultivation of the Vine & Ampelodes and the Best Mode of making Wine." Second edition, by John A. Smith. June 27.

Fowl Beans.

For sale at the New England Farmer Seed Store two barrels of small white pebble fowl Beans, raised in Milton, Mass.—They are of fine quality, free from any mixture, the seed being selected, and sown at the growth of B27.

Published every Week, at 25 per annum, payable at the end of the year—but the paper will be sent daily from the time of publishing every week to the subscribers.
